# Introduction

IN THE 2000s, white-collar crime has become a topic of almost daily news. The white-collar crime that caused the bankruptcy of Enron Corporation resulted in financial losses exceeding \$66 billion to stockholders, and likely helped lead to the recall of the governor of California. Massive violations of laws pertaining to improper investments in mutual funds and large banking firms in the United States have resulted in major losses to legitimate investors, whose losses are still being calculated. The use of shareholders' assets to fund the lavish private lifestyles of corporate chief executive officers, presidents, and chairs of the board of large corporations are becoming the fodder of scandal and media.

For example, television viewers were treated to an edited version of a videotape of Tyco International Limited head Dennis Kozlowski and friends in a \$2-million bacchanal celebrating his wife's birthday at the expense of the corporation. The WorldCom bankruptcy that resulted from white-collar crime caused billions of dollars in lost investments. The costs to ordinary stockholders are massive, but costs to employees, collateral business, communities, and society are incalculable.

Human lives have been altered forever by the unlawful actions of a few whose need for power and profit resulted in illegal, unethical, and immoral acts. While one can conceive of the plausibility that

the offenders did not define their behaviors as criminal, that in part could be because there is no clear definition of what is meant by the term *white-collar crime*.

The concept of white-collar crime was first conceived by Edward Alsworth Ross (1907), and approximately 30 years later white-collar crime was born in the ideas of Edwin H. Sutherland (1939–40). Sutherland, in coining the term, defined white-collar crime as "... a crime committed by a person of respectability and high social status in the course of his occupation." For Sutherland, the white-collar category included "business managers and executives," although, in research, he included corporations as offenders as well. He believed that a white-collar offense was a crime if it proved to be socially injurious and punishable.

Therefore, an act of white-collar crime could be dealt with in a criminal, civil, or administrative manner. Paul Tappan (1947), a lawyer and sociologist, disagreed with Sutherland's argument. Tappan believed that a behavior could only be considered a white-collar crime if the act was legally defined as a crime and if the offender had been convicted for the offense. That is, he rejected Sutherland's belief that a white-collar crime could be a violation of civil or administrative law without being condemned by criminal law. Frank Hartung (1950) argued that while legal definitions were important in

the general scheme of things, white-collar crimes represented a special case. Whereas, in most instances, it is possible to distinguish between criminal and civil violations, in the case of white-collar crime the artificial distinction between civil and criminal laws was blurred and lacked importance. In response to Hartung's statement, Ernest Burgess (1950) rejected a totally legal definition of crime, arguing for a labeling-perspective definition that required that persons could only be criminals if they perceived of themselves as such. From the white-collar offender's perspective, Gilbert Geis's (1967) findings would support Burgess's definition of crime. Geis found that white-collar criminals often do not perceive their acts as crime, and therefore do not perceive of themselves as criminals.

Marshall Clinard and Richard Quinney (1973) replaced the term *white-collar crime* with two other classification categories, Corporate Crime and Occupational Crime. Corporate Crime referred to the criminal behaviors of corporate entities, while Occupational Crime referred to the criminal behaviors of persons within their occupational status.

Laura Schrage and James Short (1978) proposed the term *organizational crime*. They considered such crime in the context of the operative goals of the organization, the actual unstated goals of the organization, which often differ from its official goals. Clinard and Peter Yeager (1980) defined corporate crime as "... any act committed by corporations that is punishable by the state, regardless of whether it is punished under administrative, civil, or criminal law."

Albert Biderman and Albert Reiss (1980) withdrew the idea of status from the definition of white-collar crime. They argued that individuals, other than those of an upper-class, were capable of committing crimes in their occupational roles. As a result, they emphasized the importance of defining white-collar crime as a violation of a position of trust. For example, if a waitress inflates a customer's bill, the customer is likely to pay both the inflated amount as well as a larger tip without realizing that she has been victimized. The waitress, for her part, not only profits personally, but also violates the trust placed in her by her employer.

James Coleman (1989) suggested that many of the attempts to redefine white-collar crime in other terms have undermined Sutherland's 1949 position since they "do not include many of the offenses covered in Sutherland's original definition," and/or

"are best seen as varieties of white-collar crime." Clinard (1990) suggested replacing white-collar crime with the terms *corporate corruption* and *abuse of corporate power*. These terms included both corporate and occupational crimes, regardless of whether they violate criminal, civil, or administrative laws. In addition, Clinard included behaviors that may not be explicitly defined as violations of law, but that may be unethical and/or immoral in the corporate or occupational context. For example, a scientist who cheats on her research by altering the findings of a study may not have violated a law or regulation, but instead has violated an ethical rule or norm of the scientific community. Under Clinard's hypothesis, that person may have committed a white-collar offense, since she engaged in an unethical and/or immoral behavior in her occupational context.

For the purposes of this encyclopedia, white-collar crime can be defined as:

Any behavior that occurs in a corporate and/or individual occupational context; and, that is committed for personal and/or corporate gain; and/or, violates the trust associated with that individual's and/or corporation's position and/or status; and that is a violation of any criminal law, civil law, administrative law, rule, ruling, norm, or regulation condemning the behavior.

This definition is necessarily both sociological and legalistic in nature, and therefore includes any behavior that may be socially defined as unethical or immoral, as well as behavior that is not legally defined as an offense. In addition, the definition does not include Sutherland's requisite that the violation be "committed by a person of respectability and high social status." This description was not included because white-collar crimes can be committed by persons who do not necessarily hold "high social status."

Bank tellers do not usually enjoy high social status in our society however, they are in a position of trust where they can engage in white-collar crime. Furthermore, John Hagan and Patricia Parker (1985) have suggested that those persons convicted for white-collar offenses are more likely to be in middle-management than in the high prestige and social status group of the top managers in criminal corporations. Finally, punishability for an act is not an important issue. However, it may be assumed that if an

act is a violation of some law, then it must be punishable as well. This broad definition of white-collar crime may bother some scholars in the field. However, given the diversity of the behaviors that have come to be described as white-collar and corporate crime, it is difficult to create a succinct definition without necessarily excluding some of the tangential behaviors.

## HISTORY OF WHITE-COLLAR CRIME

Laws against those actions that have come to be defined as white-collar crimes have existed since ancient times. Usually, such laws were developed in reaction to events in which there was a perception that something had occurred that challenged the moral sensibilities of the society. Geis, in his article in this encyclopedia on ancient mercantile crime, discusses the creation of laws to protect consumers and to guarantee an adequate food supply for the people. While hoarding grain in order to reduce supply and provide large profits might make sense to a lot of people, hoarding could also lead to public unrest and the overthrow of governments that chose to do nothing to guarantee a reasonably priced supply of staple foods.

George Robb (1993) described the cyclical development and repeal of white-collar crime laws in response to specific acts of fraud and immorality in business that brought fortunes to some and ruin to many. Many of these laws were developed to deal with “stock touting,” a practice that has existed as long as there have been stock markets, and that continues to occur to this day. Stock touting involves creating companies, and issuing stock in those companies based on false and/or misleading assets, information, or promise.

For example, Robb wrote about persons who created companies to build railroads in far parts of Great Britain, claiming that they possessed government guarantees that when the railroad was built, stockholders would be instantly wealthy. The stock sold quickly to speculators interested in making money, and the touters quickly disappeared, money in hand, with no railroad ever built. Such frauds aimed at unsuspecting speculators can be found in modern days as well. For example, the high-technology “bubble” of the 1990s resulted in the sale of stock in companies with much promise, but little if any underlying market value. When the bubble burst, stockholders were left holding shares in com-

panies that lacked any tangible assets. Compounding the problem, many stockholders had borrowed money using their stockholdings as collateral, leaving those unable to repay their debts bankrupt and their lenders taking losses as well. Robb noted that touting laws were enacted in reaction to such losses, and would be repeatedly repealed once the British Parliament decided that there was no longer a risk of such behaviors. Unfortunately, as soon as the laws were repealed, stock touts reappeared, new laws were created in response to their behaviors, and the cycle would continue over and over.

The Interstate Commerce Commission (ICC) Act of 1887 was enacted in the United States in response to the behaviors of the robber barons in the railroad industry. The robber barons, who included so-called reputable business leaders and politicians such as Leland Stanford, Sr., and Jay Gould, built railroads connecting the East and West Coasts of the United States, often without investing a cent of their own, and used their transportation monopoly to their own benefit. Before the passage of the ICC act, the railroad owners were free to set their own prices for transporting goods, often raising prices to the point that western farmers and ranchers could not make a profit on their goods. The ICC act created a commission that was meant to regulate the cost of interstate transportation of goods to guarantee that railroads would receive a fair income for their services, while farmers and ranchers would still be able to profit from their labors and goods.

The Sherman Antitrust Act of 1890 was enacted as a response to the growth of monopolies that threatened to destroy competition in the marketplace. A monopoly occurs when a producer controls an entire market for a product to the exclusion of others who would produce the product for a lesser cost. A monopoly allows the controlling producer to set any price for a product. A monopoly producer can set that price as high as she wants, with no fear of losing business due to competition from other producers. The Sherman Act was officially enacted because companies in various industry groups were attempting to eliminate their competition in the marketplace, thus hurting the economy.

It is noteworthy, however, that for the first decade of its existence, the Sherman Act was used almost exclusively as a tool to harass and criminalize the labor unions in their attempts to organize employees of those corporations which the act was

enacted to regulate. Other acts, such as the Clayton Antitrust Act of 1914, the Federal Trade Commission Act of 1914, the Robinson-Patman Act of 1936, the Cellar-Kefauver Act of 1950, and the Hart-Scott-Rodino Act of 1976, furthered attempts to shape and regulate unethical behaviors of business.

The Pure Food, Drug, and Cosmetic Act of 1906 served to rein-in industries that produced products that might endanger the welfare of Americans. Prior to this act, there were no enforceable regulation over food production in the United States. Authors, such as Upton Sinclair, in his novel *The Jungle*, exposed the abuses in the meatpacking industry. Also, prior to the passage of the act, poisons sold as drugs and cosmetics often had little or no positive effect; more likely having a significant negative effect on the health safety of consumers. The Sarbanes-Oxley Act of 2002 is a more recent attempt to respond to corporate criminal wrongdoing, requiring greater disclosure and accountability for corporate boards-of-trustees for the unethical and illegal behaviors of their executives and corporations.

The academic study of white-collar crime did not begin until Sutherland used the term *white-collar crime* in his presidential address before the American Sociological Society in 1939. In his 1949 book, *White-Collar Crime*, Sutherland presented the results of a study of white-collar crime offenses. During the next decade, a very limited amount of research on white-collar crime existed, primarily involving the definitional issues discussed previously. It was not until the publication of studies of the descriptions of behaviors defined as white-collar or corporate crimes, or Modus Operandi Studies as John Braithwaite (1985) has called them, that academic researchers renewed their interest in the topic.

These included studies such as Geis's research on the heavy electrical equipment scandal of the late 1950s and early 1960s; Quinney's (1963) study of prescription violations among pharmacists, and Diane Vaughan's (1983) investigation of the Revco prescription fraud scandal. These and similar research probes have given us a basic description of diverse white-collar and corporate crimes.

## THE ENCYCLOPEDIA

This reference, the *Encyclopedia of White-Collar & Corporate Crime*, is edited to incorporate information about a variety of white-collar crimes, and provides examples of persons, statutes, companies, and convictions. It is acknowledged that it does not, and cannot encompass all behaviors that may be defined as white-collar crimes. The articles have been written primarily for the college library, public library, and high-school library readers. Post-graduate academics and law firms may find the reference useful to add to their libraries. As such, the articles focus on the introductory knowledge that students can utilize.

The authors of the articles come from a variety of social science disciplines, although nearly all are current or retired academicians. The articles on laws describe the specific elements of the laws in terms of what types of illegal acts they are meant to apply to. Articles dealing individuals give a brief biographical sketch of the individual, but primarily focus on how they relate to the study of white-collar crime. Criminal events include descriptions of specific cases of white-collar crime, some very current, and others that were studied in the past. Both are relevant to our knowledge of white-collar crime. Some of the articles also deal with white-collar crime in countries other than the United States, to provide perspective that white-collar and corporate crime is hardly an American phenomenon.

As the definitions of white-collar and corporate crime remain somewhat fluid, we have included in this work other articles dealing with organized crime and prostitution, for example, which we acknowledge are not conventionally defined as white-collar crimes. However, elements of organized crime, prostitution, drug-trafficking, human-trafficking (for example) are addressed in this encyclopedia as these are criminal activities intertwined with white-collar crimes such as money-laundering, bribery, and government corruption.

# Timeline

1473

One of the first pieces of legislation relating to the crime known today as embezzlement is enacted in England based on a crime known as the Carrier's Case, which involved the theft of bales of wool by an agent while transporting them to the coast.

1863

Congress enacts the False Claims Act; it is designed to deter fraud against the federal government by authorizing private citizens to file charges against any party attempting to collect payment from the government through fraudulent claims.

1880

The term *boycott* is originated, named after Charles Cunningham Boycott, whose ruthless evictions of tenants in Ireland provoked his employees so much they refused to have any dealings with him.

1881

Looking to supplement a federal trademark law passed in 1870, Congress passes the Trade-Mark Act, which allows trademark holders to sue for infringement of their trademarked product.

1886

A United States Supreme Court ruling in *Santa Barbara v. California* declares that a corporation is a nat-

ural person, that is, a corporation is guaranteed the same civil liberties that a person has bestowed upon him or her.

1890

The Sherman Antitrust Act provides a working definition of corporate crime, stating, "every contract, combination in restraint of trade or commerce among the several states, or with foreign nations, is hereby declared to be illegal. Every person who shall make any such contract or engage in any such combination or conspiracy, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by a fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court."

1906

The federal government files a lawsuit against Standard Oil and John D. Rockefeller, claiming violation of the Sherman Antitrust Act. The case is debated all the way to Supreme Court, and in 1911 Standard Oil is divided into 34 smaller companies.

1906

President Theodore Roosevelt coins the term *muck-rakers*, referring to a group of journalists who were among the first to expose corruption in American

big business. He said of them, “[they have] provided American journalism with what many regard as one of its finest hours.”

1906

In response to Upton Sinclair’s concerns about the safety of America’s meat supply documented in *The Jungle*, coupled with issues pertaining to the quality of drugs being manufactured and the highly exaggerated claims proffered by the producers of health tonics, salves, and potions, Congress enacts The Pure Food and Drug Act. The act specifies that any meat products sold in interstate commerce had to be inspected by federal regulators.

1907

Edward Alsworth Ross introduces the concept of economic or financial crimes without giving evidence of the immensity of the offenses that exist at the time.

1898–1914

In the first five years following the enactment of the Sherman Antitrust Act, the U.S. Department of Justice only files nine cases relating to antitrust laws, and only 16 in the first 12 years.

Of the first 10 antitrust cases, the majority are filed against organized labor and labor organizer Samuel Gompers alleging restraint of trade by organizing strikes and boycotts. This was not the legislative intent of lawmakers stated in the Sherman Antitrust Act.

1914

The Federal Trade Commission Act is enacted. The act states that false advertising, which includes advertising facts that the advertiser has no reasonable basis to believe, regardless of future events that may prove the facts true, is an unfair and deceptive form of commerce.

1914

Due to the vague language in antitrust legislation, the U.S. Congress passes the Clayton Antitrust Act, supplementing and strengthening the Sherman Antitrust Act of 1890.

1920

The U.S. Congress passes the Truth in Fabric Act, designed to accurately display the type of fur or cloth the consumer is buying.

1924

Portuguese-born Arturo Alvez Reis uses forged government documents in order to deceive the British bank-note printer, Waterlow, into assuming that Alvez was executing an official government order. Alvez makes off with a high sum of Portuguese bank notes before the British authorities discover his intentions later that year.

1927

The U.S. Supreme Court upholds the previous ruling on the Teapot Dome Scandal, which declared the federal government’s leases on the Teapot Dome and Elk Hills oil reserves as “illegal and fraudulent.” Warren G. Harding, who was implicated in the scandal, is considered by many political historians to have been the worst president in U.S. history.

1931

Notorious gangster Al Capone, whose crimes extend far beyond the one he was imprisoned for, is convicted of income tax evasion, as the mafia boss kept no record of his finances.

1938

The U.S. Congress passes The Food, Drug, and Cosmetic Act, regulating cosmetics and therapeutic devices.

1939

Edwin Sutherland presents his presidential address to the American Sociological Society (ASS) meeting in Philadelphia, Pennsylvania. In the address, Sutherland, for the first time, describes *white-collar crime*, a term he has coined to describe the criminal activities of the upper-class and corporations.

1946

The Lanham Act, which lays the groundwork for all future trademark legislation, defines a trademark as “any word, name, symbol, device, or any combination thereof adopted by a manufacturer or merchants to identify goods and distinguish them from those manufactured or sold by others.”

1947

The first environmental law in the 20th century is passed. The Federal Insecticide, Fungicide and Rodenticide Act requires companies to register pesticides used in interstate commerce.

1949

Edwin Sutherland publishes the first edition of *White-Collar Crime*. In that book, he details the criminal behaviors of the 70 largest U.S. corporations at the time. He does not mention the names of the corporations out of apparent fear of reprisal. The 1983 third edition of the book, published 33 years after Sutherland's death, gives the names of the corporations studied for the first edition. He also theorizes that white-collar crime can be explained best by his theory of differential association, which assumes that all behaviors are learned behaviors.

1950

The Celler-Kefauver Act is passed, strengthening previous antitrust legislation by amending sections and adding provisions to the Clayton Antitrust Act of 1914.

1949–56

Telephone company AT&T is accused of antitrust laws by the Federal Communications Commission (FCC); the FCC's intention being the removal of AT&T subsidiaries Western Electric and Bell Laboratories from the company's system. AT&T agrees to a consent decree, allowing the company to keep control of the two subsidiaries but forbidding it to expand into other areas of communication.

1956

Congress passes the Federal Water Pollution Control Act. The act creates the Federal Water Pollution Control Administration, which approves and regulates new water quality standards.

1956

Facing mounting lawsuits by thousands of women claiming their children had been born with birth defects, pharmaceutical manufacturer Merrell Dow discontinues the production of Bendectin, a prescription drug that is used to alleviate morning sickness and nausea in pregnant women.

1959

The U.S. Senate begins committee hearings into allegations that the largest electrical equipment makers in the United States were conspiring to fix prices. Among the manufacturers were major providers General Electric, Westinghouse, Allis Chalmers, and Federal Pacific Electric.

1960

Congress investigates the meatpacking industry; reports conclude that about 15 percent of all commercially slaughtered animals and about 25 percent of all commercially prepared meat products were not examined by USDA investigators because the meat was only distributed within the slaughtering and packing plant's state.

1960

The International Brotherhood of Teamsters Pension Fund managers loan money from the fund to organized criminals, usually through straw men, for casinos, hotels, and resorts. The recipients of the fund "proceeds" included such noteworthy establishments as Rancho La Costa, Circus Circus, Caesar's Palace, the Dunes, and the Sands.

1957–61

Multinational conglomerate General Electric, Westinghouse, and other manufacturers of heavy electrical equipment are convicted of price-fixing and other charges for electrical equipment valued at \$1.74 billion per year. It is the largest price-fixing case in the history of the Sherman Antitrust Act at that time. This is the first time that individual white-collar criminals are jailed for their offenses. GE's fine is equivalent to a person earning \$175,000 per year having to pay a \$3 parking ticket.

1962

United States Steel Corporation is accused of violations of the Sherman Antitrust Act, issuing building loans that stipulate the builder/borrower must use materials purchased from the steel corporation at artificially high prices.

The case is tried in the Supreme Court three times before a February 1977 ruling stated that the corporation did not violate antitrust laws.

1962

The U.S. Congress passes the Kefauver Harris Drug Amendments, requiring that drug companies show evidence their products were safe to a relative degree.

1965

The United States Congress passes the Federal Cigarette Labeling and Advertising Act, requiring the surgeon general's health warnings on all cigarette packages.

1966

The U.S. Congress passes the National Traffic and Motor Vehicle Safety Act in mandating the incorporation of safety devices that were designed to prevent as many fatalities as possible in automobile accidents. During the next six years, automobile accidents decline at an average rate of 3.5 percent annually. The act also established the National Highway Traffic Safety Administration under the Department of Transportation to oversee safety and consumer programs, including motor vehicle crash testing and automotive recalls.

1968

The U.S. Congress passes the Truth in Lending Act, designed to promote economic stability by protecting the credit rights of consumers. No longer, the act says, will consumers be subject to fine print and misleading credit applications.

1970

Ford Motor Corporation unveils its new automobile, the Pinto, despite tests revealing that rear-end collisions sometimes caused fuel-line ruptures, setting the vehicle aflame.

1970

In response to rising concerns about worker and workplace safety, the U.S. Congress passes the Occupational Safety and Health Act. Enacted under the federal government's Constitutional right to regulate interstate commerce, the legislation aimed to guarantee that workers across the country have a workplace that is free from unreasonable dangers.

1970

In response to growing concern for the environment, the Clean Air Act (CAA), first passed in 1970 and amended substantially in 1990, introduced a set of guidelines requiring states to regulate sources of air pollution to specific air quality requirements, and to have regulatory programs in order to attain improved levels of air quality.

1971

The U.S. Congress bans all broadcast advertising related to cigarettes.

1972

The Consumer Product Safety Act is enacted as a response to perceptions that product liability laws

did not sufficiently protect consumers from unsafe products. To implement the act, the Consumer Product Safety Commission was created. The Commission was responsible for administering additional consumer protection laws, including the Federal Hazardous Substances Act and the Flammable Fabrics Act.

1976

Amending the Clayton Act of 1914, Congress passes the Hart-Scott-Rodino Antitrust Improvements Act, requiring that certain proposed mergers of assets be approved beforehand by the Federal Trade Commission and the Antitrust Division of the U.S. Department of Justice.

1976

The Toxic Substances Control Act is signed into law by the U.S. Congress and directs the administrator of the Environmental Protection Agency (EPA) to establish testing procedures for toxic chemicals, publicize results of chemicals that prove to be dangerous, and to set guidelines for controlling toxic chemicals.

1977–79

The Federal Bureau of Investigation conducts a sting operation in which agents pretend to be wealthy Arab sheiks seeking investment opportunities in the United States. Seven legislators, including a Senator and six Congressional representatives are videotaped accepting bribes from these agents in return for political favors. The scandal comes to be known as ABSCAM, after the bogus Abdul Enterprise company.

1980

Marshall Clinard's book, *Corporate Crime*, reveals that between 1975 and 1976 the country's 582 largest corporations had violated the law a total of 1,553 times.

1980

The Equal Employment Opportunity Commission issues a set of guidelines detailing prohibited sexual behavior that applies to all federal agencies and to private businesses with 15 or more employees

1981

Three General Electric executives are imprisoned over a payment of \$1.25 million to a Puerto Rican

official to obtain contracts to a federally owned electrical plant.

1984

Ten thousand workers and townspeople are killed after one of Union Carbide's India-based plant releases liquid methyl isocyanate, a harmful gaseous chemical, after allowing a number of their products to rust and decay.

1984

A Louisiana hospital requires that all surgical patients use the services of one of four anesthesiologists. A competing anesthesiologist charged that this violated the Sherman Antitrust Act. The U.S. Supreme Court's 1984 decision that this case did not represent an illegal tying arrangement was based on the hospital's lack of dominant position; it only housed 30 percent of area hospitalized patients.

1976–85

A report by the U.S. General Accounting Office reveals that 51.5 percent of all drugs introduced had to be relabeled because of serious adverse reactions found after the marketing of these drugs.

1980–86

Teledyne Hydra-Power, a unit of Teledyne Industries, defrauds the U.S. Navy of \$4.5 million on a helicopter contract by inflating the price of parts and hours worked.

1988

The Major Fraud Act is signed into law by President Ronald Reagan, significantly increasing the maximum penalties that could be assessed for certain economic frauds committed against the U.S. government.

1988

Congress updates the Lanham Act with the Trademark Law Revision Act, changing the period of trademark protection from 20 years to 10 years, with infinite renewals. The act also stipulates that after five years, the trademark holder is required to file an affidavit showing that the trademark will continue to be used.

1989

The U.S. government brings criminal charges against Charles Keating for fraud, racketeering and

conspiracy, and the government takes control of Lincoln Savings and Loan.

1989

The U.S. Public Interest Research Group reports that oil company Chevron's operations in the Gulf of Mexico have a less-than-admirable safety record. The research firm reported that between 1956 and 1989, offshore rigs operated by Chevron had experienced 10 gas blowouts, 65 fires and explosions, 40 pollution incidents, and 5 pipeline breaks or leaks.

1989

A study by research firm Essential Information reports that between 1984 and 1989, Chevron had spilled a total of 2.8 million gallons of oil, making it the world's largest and most consistent spiller of oil.

1989

Talk show televangelist Jim Bakker is convicted of fraudulently raising more than \$158 million. A 28-page indictment included 8 counts of mail fraud, 15 counts of wire fraud use of telephone and television, and 1 count of conspiracy to commit wire and mail fraud.

1989

U.S. multinational corporation Union Carbide settles out of court for \$480 million with the families of victims involved in a 1984 chemical spill.

1990

The U.S. Congress passes the Nutrition Labeling and Education Act of 1990, requiring all packaged foods to carry labels with nutrition information.

1990

Problems, including bribery and mispricing, involving General Electric become so pervasive that the Pentagon's Defense Contract Management Agency takes the unique step of setting up a special investigations office just for the company. The office secures 22 criminal indictments against the company, its subcontractors and employees, and recovers \$221.7 million.

1980–90

Legislation is enacted to curb redlining, a process in which real estate agents and insurance companies exclude certain socioeconomic groups and/or races

from certain neighborhoods. Such acts include the Home Ownership Protection Act, the Community Reinvestment Act, and the Home Mortgage Disclosure Act.

1991

Twenty-five employees are killed in a fire in an Imperial Food Products Incorporated chicken processing plant. The employees were unable to escape the flames due to the exit doors being locked due to management fear of employee theft.

1991

Investment company Solomon Smith Barney's telecom research analyst Jack Grubman falsifies company reports to make certain companies appear healthier than they actually were, causing a number of investors to lose substantial amounts of money.

1992

A lagged time-series analysis of price-fixing offenses between 1890 and 1988 finds no significant relationship between price-fixing enforcement and political and economic variables. The study is the only long-term longitudinal study of price-fixing.

1997

Camel Cigarette Corporation drops its famous Joe Camel advertising campaign amid mounting lawsuits that claimed the cigarette-smoking cartoon character featured on posters was marketed toward children, a demographic that could not legally purchase the product.

1990–2000

The Financial Action Task Force (FATF) calculates that approximately \$500 billion is processed in money laundering operations around the world each year.

2000

Owens Corning, which sells industrial pipe insulation, is driven to bankruptcy by the settlement of over 243,000 asbestos-related claims.

2001

An Italian court acquits former chemical company managers of charges that stemmed from a 10-year period in which 150 workers died from exposure to a harmful chemical. The managers were acquitted because the company was not aware of the harmful

effects of the chemical until after the workers were contaminated.

1990–2002

General Electric is involved in 63 court cases brought against it by the federal government. The sum of the settlements reaches \$982 million.

2002

The Securities and Exchange Commission files a lawsuit against former executives of Waste Management, Inc., accusing them of inflating earnings by almost \$2 million.

2002

John J. Rigas of Adelphia Communications, a cable company based in a small rural town, is accused by the federal government of concealing \$2.3 billion in debt from investigators and Adelphia Communications shareholders.

2002

In response to the growing amount of stock fraud cases, Congress passes the Sarbanes-Oxley Act, creating a series of oversight measures, and expanded and increased the sanctions for illicit white-collar actions.

1980–2003

Millions of Americans are affected by advanced fee fraud associated with African-based criminal groups. Advanced fee fraud involves a promise of a large amount of money given to the participant if the participant details personal banking information to the foreign-based entity.

2003

A study estimates that the common practice of price fixing may cost the American public as much as \$78 billion per year.

2004

Media tycoon Martha Stewart is convicted of lying to cover up possible insider trading. Critics accuse prosecutors of zealously showcasing the Stewart case as an example of how rich and famous white-collar criminals are now being pursued and prosecuted by the U.S. government.

## A. H. Robins

IN 1997, more than 25 years after A. H. Robins introduced the Dalkon Shield intrauterine device (IUD) as a safe, effective contraceptive, the last of the product liability suits against the company were headed for court. In the intervening years, at least 20 deaths and 200 miscarriages had been caused by the Dalkon Shield; 235,000 women attributed pelvic infections, often leading to infertility, to their use of the product. The Shield had been on the market in the United States for less than four years, from January 1971 to June 1974.

Marketed by A. H. Robins as a safer, more effective alternative to oral contraceptives, the Dalkon Shield was essentially an untested device with unknown effects. At the time, the U.S. Food and Drug Administration (FDA) required advance testing and approval only for drugs, not for medical devices. Since IUDs are presumed to work by irritating the uterus in a woman, thus preventing fertilized eggs from implanting there, they qualified as contraceptive devices.

Although A. H. Robins included copper in the Dalkon Shield in hope of an additional contraceptive effect, and mentioned this in their marketing to doctors, the company downplayed the importance of the copper in its reports to the FDA so that the Shield would not be reclassified as a drug.

Such testing as the company relied upon was inadequate and misrepresented. The original clinical trial by Dr. Hugh Davis, inventor of the Shield and shareholder in the Dalkon Company bought by Robins, claimed a 1.1 percent pregnancy rate, with few side effects or spontaneous rejections of the Shield. Later reviews of Davis's study argued that his testing period was insufficient, his sample too small, and his procedures gravely flawed. The Shield was also significantly redesigned by A. H. Robins, making Davis's results meaningless. Results from a later 10-clinic study, touted by A. H. Robins as the "Cadillac" of clinical studies, were largely concealed from the public. In an internal company report quoted by Minneapolis, Minnesota, investigative reporters Susan Perry and Jim Dawson, project coordinator Dr. Ellen Preston noted that studies would be funded only if they were "known in advance to be favorable." Lacking such studies, Robins continued to use the 1.1 percent figure in its marketing, even though independent researchers put the pregnancy rate as high as 5 percent and argued that the Shield's rejection rate and side effects were worse than those of other IUDs.

The falsely low pregnancy rate attributed to the Shield left doctors and patients unprepared for the device's high risk of a second-trimester septic abortion. A. H. Robins initially instructed doctors not to remove the Shield from women who became

pregnant, as attempting to remove the device was likely to cause a miscarriage. However, doctors discovered that leaving it in almost always led to life-threatening infections at the 20th week of the pregnancy. It was at this point that expansion of the uterus pulled the IUD's tail string into the ordinarily sterile womb.

The Dalkon Shield's tail string was unusual among IUDs in being a multifilament string in which bacteria, ordinarily present in the vagina, could lodge between the filaments and wick upward into the womb. Internal memos indicate that A. H. Robins's management knew about the potential for this problem before the device went to market but were more concerned about how the stiff string might irritate men during intercourse. One manager at the Chap Stick factory, where tails were attached to Shields, pointed out the wicking problem and noted that the attachment process damaged the tails in ways that increased the likelihood of bacteria reaching the womb. He was fired.

The result of wicking was a virtual epidemic of pelvic inflammatory disease (PID) among Dalkon Shield wearers. Bacteria gained a foothold in the womb's irritated lining, initially causing low-grade infections that were often mistaken for flu. A serious outbreak of PID, however, could be life-threatening, and untreated PID typically results in infertility.

Although doctors reported these illnesses and patients' difficulty tolerating the Shield to A. H. Robins, company management insisted that they were not aware of significant problems with the Dalkon Shield. In June 1973, after the company had received warnings even from doctors involved in its early aggressive promotion of the Shield, A. H. Robins executives testified to a House Government Operations subcommittee that the device was entirely safe. A year later, swamped with product liability suits from injured women, A. H. Robins stopped selling the Shield in the United States, though it continued sales in the developing world.

As the FDA scheduled hearings on whether IUDs were safe, A.H. Robins executives hurried to destroy files that would show they knew the dangers of their product. An attack of conscience by Roger Tuttle, the lawyer in charge of A. H. Robins's Dalkon Shield litigation, resulted in his secretly preserving some of the most incriminating documents. He produced these documents on behalf of Dalkon Shield plaintiffs in 1984. The first major product li-

ability lawsuit against A. H. Robins went to trial in Kansas in 1974; a jury awarded Connie Deemer \$10,000 in compensatory damages and \$75,000 in punitive damages for harms caused by her Dalkon Shield embedding in her uterus.

Dalkon Shield litigation was about to become big business, led by attorneys Michael Ceresi and Dale Larson of Minneapolis law firm Robins, Zelle, Larson and Kaplan, with a seminal series of trials taking place before flamboyant Minnesota judge Miles Lord. A. H. Robins's attorneys attempted to discourage lawsuits by grilling plaintiffs about their sexual history, bathroom habits, and even whether they wore pantyhose. None of these factors were ever shown to have any relationship to PID or other harms attributed to the Shield.

A. H. Robins attempted to limit its liability by declaring bankruptcy under a Chapter 11 restructuring in August 1985. The restructuring plan, administered by Judge Robert Merhige in the company's home jurisdiction of Richmond, Virginia, ultimately set up a \$2.35 billion trust to pay claimants. Richard Sobol's history of the bankruptcy argues that Robins manipulated the process to minimize the number of claimants and to delay payments so long that many injured women were too old to use their settlements to pay for fertility treatments. Certainly, in 1991, six years after the initial filing, women were complaining that settlements were too slow and too small. Meanwhile, A. H. Robins denounced its external legal counsel for over-billing the company.

Sobol notes that A. H. Robins's reorganization plan included provisions that plaintiffs could not sue third parties, such as the individual A.H. Robins executives who had approved the company's handling of the Dalkon Shield. This injunction was probably an incentive for American Home Products, now renamed Wyeth, to purchase the bankrupt company in 1988.

Thanks in part to the Dalkon Shield tragedy, the FDA gained, in 1976, the authority to require testing and approval of medical devices. The first IUD they approved, G.D. Searle's Copper-7, became a focus of similar litigation in the mid-1980s. In 1991, Dr. Richard A. Kromnal, who had been a consultant for A. H. Robins on the Dalkon Shield, published a reanalysis of his own study data, arguing that the risks of IUDs had been overstated by other researchers. As of late 2003, Planned Parenthood was promoting IUDs as "the most inexpensive long-

term reversible method of contraception available in the world.” Wyeth does not currently market IUDs.

## AAMCO

PERHAPS IRONICALLY for a company that stresses trust in its advertising, this 700-shop transmission repair franchise has a 35-year history of defrauding consumers with unneeded overhauls and unhonored warranties.

Founded by high school drop-out Anthony A. Martino in 1959 as a shop that specialized in repairing the newly available automatic transmissions, AAMCO went national as a franchise in 1962 with the help of franchising expert—and later company president—Robert Morgan. As with many franchise operations, AAMCO’s ideal franchisee was not a shop owner with relevant technical skills, but an energetic, inexperienced entrepreneur who was willing to learn a system. Arthur Glickman reports in *Mr. Badwrench* that AAMCO actively sought non-mechanics to operate its franchises. The

AAMCO system emphasized bringing customers in with promised low prices, then selling higher-priced services. A sales manual from the late 1960s, about the time that Morgan bought out Martino, is quoted by Glickman as stating: “It is AAMCO’s policy that the purchase of an AAMCO custom rebuilt transmission be suggested to every customer who enters your shop.”

By 1970, AAMCO franchisees had followed these instructions so thoroughly that the parent company had to sign a consent agreement with the Federal Trade Commission (FTC) promising no more deceptive advertising or bait-and-switch sales tactics. Fourteen months later, AAMCO admitted to 233 violations of this order. Over the next 15 years, a series of undercover investigations in 17 states found that AAMCO shops consistently sold unneeded, and sometimes unperformed, transmission rebuilds. These investigations culminated in a 1987 14-state settlement in which AAMCO promised to implement a “secret shopper” program that would prevent individual AAMCO shops from inflating repair costs.

The most common complaint against AAMCO was that customers whose cars needed minor repairs were sold a complete transmission rebuild or replacement, with a lifetime warranty, at a cost about eight times that of the needed work. Methods of motivating car owners to pay for extensive transmission work ranged from the classic “metal shavings in the pan”—promoting a common, harmless condition as cause for alarm—to showing customers damaged parts from other transmissions kept for the deceptive purpose.

Many customers complained later that their transmissions were in worse shape after the repairs than before, and that AAMCO attempted to charge for additional repairs rather than honoring their warranties. Complained Anita Rubin, who bought the lifetime warranty for her five-year-old truck only to have AAMCO fail to fix it four times, to the *New York Times*: “What are they advertising? It doesn’t say it’s a lifetime warranty as long as it doesn’t break down.”

By 1989, some AAMCO franchisees were so frustrated that they considered filing a class action lawsuit against the company, alleging that the company failed to provide technical support and harassed franchisees who refused to sell unneeded repairs to consumers. The matter was settled out of court.

AAMCO continues to offer customers the option of buying a lifetime warranty on transmissions. The corporate internet site boasts that CEO Keith Morgan, son of Robert Morgan, has since 1992 led the company to its highest profits ever.

## ABSCAM

THE ABSCAM scandal involved a Federal Bureau of Investigation (FBI) sting operation conducted during the late 1970s in which members of Congress and other prominent political figures were videotaped accepting financial bribes from agents posing as Arabian sheiks. In all, seven legislators including a senator and six Congressional representatives from five different states were convicted, fined and/or imprisoned for accepting cash or stock bribes in return for political favors.

The ABSCAM (which is short for Abdul Scam and named after the bogus Abdul Enterprise company) operation began in 1978 when FBI agents working with a convicted swindler, Melvin Weinberg, created a fraudulent Arabian company, Abdul Enterprises Limited, on Long Island, New York. The fictitious company was set up to represent imaginary and wealthy Arabs, Kambir Abdul Rahman and Yassir Habib, who were interested in investing in the United States.

Weinberg was designated the chairman of the company. Once established, agents quickly spread word about the two wealthy Arab businessmen and their intentions to engage in shrewd business transactions. As part of the operation, the FBI deposited

\$1 million at the Chase Manhattan Bank in the name of Abdul Enterprises to give the false company instant credibility. Originally, the operation was established to focus on business officials accepting bribes or engaging in other fraudulent practices. For instance, the fictitious Arabs engaged in several scrupulous deals with individuals selling stolen securities, art, and forgers of certificates of deposit. However, by the fall of 1978, the ABSCAM operation ventured into the political arena that involved bribes of federal and state officials.

A group that had sold Abdul Enterprises phony certificates of deposit suggested that the wealthy Arabs should establish a casino in New Jersey. This forger group offered to introduce the fictitious Arabs to a New Jersey politician who could guarantee a state gambling license. The politician was Angelo Errichetti who was the mayor of Camden, New Jersey. Shortly after their initial meeting with Errichetti, Abdul Enterprises was able to bribe the vice-chairman of the New Jersey Casino Commission, Kenneth MacDonald, concerning the approval of the gambling license. By the spring of 1979, Errichetti provided undercover FBI agents with a written list of federal and state politicians in New Jersey and the surrounding areas who were willing to engage in similar corrupt relationships. Errichetti indicated that these politicians were open to bribes concerning construction related issues, such as zoning waivers and building permits. In other instances, Errichetti arranged meetings between two Philadelphia lawyers, Howard Criden and Ellis Cook, and the Arab sheiks who expressed interest in gaining political asylum.

The Congressional bribery stage of ABSCAM operation occurred in July 1979 when Errichetti arranged a meeting between associates of Kambir Abdul Rahman, one of the fictitious Arab businessmen, and two Democratic representatives from Pennsylvania, Ozzie Myers and Raymond Lederer. In particular, the two representatives were given \$50,000 in cash to provide assistance in immigration issues and other political favors. Errichetti also introduced the Arab businessmen to Frank Thompson, Jr., a well-established Democratic New Jersey legislator. Thompson was the chairman of the House Committee on Administration and the Subcommittee on Labor-Management Relations.

Similar to Myers and Lederer, Thompson was offered bribes to help the Arabs overcome immigration laws. From this arrangement, Thompson intro-

duced the Arabs to another congressman, John Michael Murphy, from Staten Island, New York. Murphy was chairman of the Committee on the Merchant Marine and Fisheries and readily helped the Arabs in exchange for monetary gifts. Finally, Errichetti introduced the Arab businessmen to Harrison Williams, Jr., the senior senator from New Jersey.

Williams was a distinguished Democratic legislator who served as chairman of the Committee on Labor and Human Resources and of the Subcommittee on Securities, Housing, and Urban Affairs. Beyond cash incentives, Abdul Enterprises offered Williams stock certificates in a fraudulent titanium company in exchange for influencing government contracts for proposed ventures.

The many exchanges between the Arab agents and the congressmen were secretly recorded and videotaped by the FBI. These recordings captured meetings, agreements to accept payments, and the actual acceptance of bribes. Telephone conversations were also recorded. Based on this evidence, several legislators were brought to court on charges of bribery. In many instances, the legislators maintained that the ABSCAM operations were prime examples of entrapment intended to smear them and their reputations. Notwithstanding these allegations, several of the legislators were convicted of various criminal charges and some were even sentenced to prison terms including Senator Harrison Williams.

Beyond the criminal convictions, many members were expelled from Congress or forced to resign. For instance, Michael Meyers was expelled from the House of Representatives marking one of the few times in history a sitting member of Congress was expelled for committing official corruption. Two other members, John Jenrette and Raymond Lederer resigned before their expected expulsions. Williams also resigned just days before his expected expulsion.

## accounting fraud

ACCOUNTING FRAUD, or false financial reporting, is often at the heart of the most extensive white-collar crimes. Among the examples are the Equity Funding Corporation of America, the fiscal fabrications of hundreds of savings and loan annual reports in the 1980s, and Enron Corporation. Accountants and auditors may assist in other corporate offenses by covering up evidence. For example, by making profit from labor or environmental law violations appear as legitimate income or keeping it off the records altogether.

Accurate financial statements and reports of assets and liabilities, profit or loss, are absolutely required for business and investment decisions. Accounting fraud involves falsification of financial records by overstating profits and assets, understating liabilities and debt, or hiding profit from tax authorities. The complexity of accounting practices makes obscuring a company's true financial standing easy. As such, the public relies on the professional ethics of accountants.

Opinion polls place accountants among the most honest professionals. The designation Certified Public Accountant (CPA) after an accountant's name tends to reassure us her report is a true representation of the financial status of a business or organization. The image is enhanced by independent auditors, whose accounting examinations are often required by law.

With honest accountants and auditors double-checking figures, we assume correctly, in most cases, that financial statements are reliable descriptions of financial positions. Incidents involving Enron, WorldCom, and other corporations engaged in massive accounting fraud caution against such assumptions.

Accountants may overtly falsify or issue highly misleading statements for many reasons. Just because they are audited is no guarantee financial statements are correct, as the Enron and other casew-cases illustrated.

POSICIONES	Pesetas	Cts.
31	164	50
31	148	50
31	198	50
31	429	12

31	253	50
31	393	50
31	141	50
31	141	50

Accounting fraud can be complex or as simple as changing the left-most digit in a column.

The role of accountants and auditors in accounting fraud is complex. Accountants do not have control over the data they are given. There is a lot of room for dishonesty, if not by the accountant, then by employers or clients applying pressure or misleading financial data. The potential for fraud is considered in training accounting students, alerting them to the possibility of being asked to certify financial reports that are less than accurate.

The auditor's main job is ensuring standard accepted accounting practices are followed. Even if not, given the complexity of corporate accounts, they can explain "irregularities" that are not fraudulent. Extensive accounting frauds require some cooperation between auditors and executives in a company to falsify and certify incorrect reports. Auditors may not want to question some practices or data submitted by good clients.

The line is crossed when what is clearly fraudulent is termed an "irregularity" by auditors remaining silent in the face of an obvious accounting fraud. Accounting practices can be so far from standard regulations, or in violation of regulations that auditors who remain silent or otherwise cover-up a fraud can be criminally charged. By such inaction they become part of a criminal conspiracy.

Accounting fraud takes many forms. While some are complex requiring advanced knowledge of accounting principles, those most common are easy to understand. To name a few, the oldest is keeping two sets of accounting books. First, there is the set that accurately indicates the company's financial position, and the second set of books is for the Internal Revenue Service, illustrating a much less

profitable enterprise for tax purposes. There are many ways false financial records help executives or other company personnel. If short-term revenues fall short of goals needed to receive a bonus, accountants can be asked to make it appear as if goals were reached. Fraudulent invoices for products and services not delivered make revenues appear higher.

Simple tricks include listing income near the end of a quarter in the revenue column for merchandise not yet shipped; this is revenue that belongs in the next quarter. When it appears sales are going to be low, channel stuffing involves shipping unordered goods to regular customers. If, or more likely when, merchandise is returned, there is a worse problem in the next quarter, but for now these unordered shipments are recorded as sales on the current quarterly report.

At other times, usually for tax purposes, it is desired to report low profits. False expenses make profits seem smaller. To cheat tax authorities, corporations that operate globally can resort to transfer pricing. The corporation divides operations, placing subsidiaries in different countries. One is called a production company and the other distribution. The production company is located in a high-tax country and it sells millions of units to the distribution company at a nominal price. Since the value of products sold is recorded as small, tax is low. The distribution company in a low-tax country greatly increases the unit price for sale. Profits are high, but taxes are low due to its location in a low-tax country.

## OVERT AND COVERT FRAUD

Many accounting frauds are overt falsifications. On the simplest level, changing a number in a column far enough to the left drastically changes the appearance of a company's financial situation in the direction desired by those involved in the fraud. However, most accounting frauds involve a series of transactions to at least make things appear legitimate.

A classic example was in the savings and loan scandal of the 1980s, which engaged in land flips. In a land flip, a piece of real estate is bought for a few thousand dollars and listed as an asset worth millions. A series of transactions took place between two or more savings and loans buying the same piece of land, knowing full well it was not worth much, at an ever-increasing price for each transac-

tion. What was next to worthless was then listed as a major asset.

Motives for accounting fraud and the way records are falsified vary by industry and the goals offenders have in mind. Increasing sales commission suggests one method, while cheating on taxes is another. For the largest schemes, perpetrators have a vested interest in corporate profits. Executives receive stock options and a large number of shares as part of their compensation. If revenues increase, so does their income.

As such, accounting fraud often has its origin among executives. Since executives are hired to increase profits and stock prices the report to shareholders indicates whether or not they have been successful. They do not want bad news for shareholders (nor for themselves) so they put pressure on accountants to make the report look as favorable as possible. Not only executives, but also lower-level managers are paid on the basis of company performance, usually in sales. The W. T. Grant Company went bankrupt in the 1970s because store managers learned how to make sales appear good enough to meet goals to net pay increases and bonuses, when, in fact, sales were low. By the time the true financial picture became clear, it was too late to avert bankruptcy.

Accounting fraud can make just about any bad financial situation appear good. When natural downturns in markets occur, resorting to accounting fraud is usually felt to be temporary. In the long run, it is doomed to fail. When revenue cannot cover expenses and loan payments, failure is inevitable regardless of what an inaccurate financial statement reports.

## Adelphia Communications

CREATED AND FOUNDED by John J. Rigas, Adelphia Communications grew in the 1990s to become one of the largest cable media providers in the United States. Because of its size, investors and shareholders were shocked when they learned that the company filed for bankruptcy in June 2002. However, headquartered in Coudersport, Pennsylvania, a small rural community that Rigas called home, Adelphia Communications was not immune from white-collar crime. Federal investigators arrested Rigas, and his two sons, Michael and Timothy, on July 24, 2002, and paraded the group in handcuffs before the media.

At 77 years old, Rigas did not appear to be a typical criminal. The accusations levied against him, his sons, and two other employees, were far from typical. The group was accused of concealing \$2.3 billion in debt from investigators and shareholders, and hiding their deals that were motivated purely out of self-interest rather than corporate interest. Estimates suggest that their illicit actions netted them \$1 billion which they used to support their lavish lifestyles. According to federal prosecutors, the defendants misused the money as personal loans and cash advances, and even built a \$13 million professional golf course with the misappropriated funds.

Rigas, his sons, and the two employees involved in the scheme, former Vice President of Finance James R. Brown and former Director of Internal Reporting Michael C. Mulcahey, were indicted in October 2002. United States Attorney James B. Comey described the scheme as "one of the most elaborate and extensive corporate frauds in United States history." They also faced stiff civil charges for their misdeeds.

If convicted of the criminal charges, each defendant could be sentenced to up to 250 years in prison, fines up to \$20 million, and forfeiture of

\$2.5 billion. To some observers, Rigas was used as the poster boy of what the government can do to white-collar offenders. To others, the system's response was long overdue. Many of those who live in the Coudersport community continue to stand behind Rigas, offering their support and questioning the veracity of the charges against him and his sons.

## advance fee fraud

A SPECIFIC TYPE of fraud that has become synonymous with African-based criminal groups, and Nigerian criminal enterprises in particular, is popularly referred to as advance fee fraud (also called "419 Fraud" after the relevant section of the Nigerian Criminal Code). This fraud scheme emerged in the early 1980s and is a variation of the confidence swindle, which preys on peoples' greed and naively. Advance fee fraud targets individuals and businesses offering huge sums of money from government officials or businessmen in African countries. The targets of the fraud—which include businesses and individuals—receive a solicitation (by letter, fax, and increasingly e-mail) from a businessman or ex-government official in an African country, promising that a large sum of money (often in the tens of millions of dollars) will be deposited into the target's bank account. In return, the recipient of the letter is offered a percentage of the total amount that purportedly will be wired or transferred from Nigeria (or another African country).

The solicitation will ask its prospective victim to respond to the correspondence, including name, address, phone number, and banking information. Subsequent correspondence will ask for a process-

ing fee from the target before the money can be transferred. This fee is often in the tens of thousands of dollars. The letter will often provide specific directions on how this fee should be paid (usually a wire transfer to an overseas bank account). Once the processing fee is deposited, the funds are quickly withdrawn, and the perpetrators either disappear or attempt to coax even more money from the victim. Some schemes have gone so far as to have victims fly to an African country, where they are extorted for even more money through intimidation and violence. Of course, no funds ever transferred to the target.

The funds that are purportedly to be deposited in a target's account are frequently described as money that must be quickly and surreptitiously transferred out of an African country due to a number of reasons, such as a civil war, bankruptcy fraud, an unclaimed bank account or inheritance, or the embezzlement of money from a government or business. Regardless of the specific claim, the source of the funds is frequently held out as illegally derived. This tactic is used to increase the credibility of the offer (relying on widely held awareness of corruption in African countries) and to deter any victims who accept the offer from going to police due to their own perceived complicity in an illegal action. Although originated by Nigerian criminal groups, advance fee fraud scams now originate in a number of African countries and use internal conflicts or other circumstances specific to that country as a pretense under which funds must be transferred abroad. Below is just one example of hundreds of thousands of advance fee fraud letters (in this case, via spam e-mail).

Dear Friend,

Compliment of the season to you. I contact you with the uttermost trust and full hope that you will be in position to assist me in this mutual transaction that will benefit both of us if we join hands to work as partner. And a choice of your Country.

I am James Biko, 24 yrs old, from Guinea Bissau, born and brought up in Ghana. The son of late chief Martins Biko a gold merchant and dealer in Ghana. I must confess my agitation and my word is my bond.

Late chief Martins Biko, who was assassinated on 17th Aug 2001 by unknown faces on his way to Accra Ghana, may his soul rest in

peace. Before his death, he made a deposit of two trunk boxes contents US\$14,000,000 million and (286) kilos of (Raw Gold), with a reputable Security Company here in Cote d'Ivoire. And registered the contents as Family valuables belonging to his foreign business partner who will come soon for the claim/release and export to Abroad (no name).

I ask for you to focus your mind in this transaction, for this is not Government money, this transaction is Legal, Genuine and no risk of any kind in this transaction.

I humbly request for your permit, to submit your name to the security company as my late father's foreign business partner, for the immediate change of ownership with your name as the beneficiary of the consignment for onward release of the two trunk boxes said (money/Gold). And also, you help me to market the (Gold) and invest the money in a blue chip and profitable business in your Country, you been the trustee. While I will continue my Education.

As soon as you find this possible and interesting to help me, kindly furnish me with the followings: (1) your full name and contact address. (2) your private Tel/Fax numbers. All this information, I will submit to the security company for the change of ownership with your name and to enable me send to you the following documents proof via your Fax number: (1) The deposit certificate (2) Agreement and the receipt of the of-front payment, paid by my late father. (3) The Will proof, Legally and willed by my late father for this transaction.

Please, don't betray me if this money comes to your care, because this money is my only future hope, and be rest assured that this is real and never a joke.

I offer to give you (25 percent) of the total sum after the release of the boxes for your noble assistance. Treat as confidential for the security of this transaction and my Dear Life. Waiting for your urgent and positive response.

Best regards,

James Biko  
Abidjan, Cote d'Ivoire

## advertising fraud

ADVERTISING FRAUD is generally defined as advertising that is misleading in any material respect, either explicitly or indirectly through representations made in a statement or combination of statements, and any failure to reveal material facts. A statement or representation in an advertisement may also be false or fraudulent when it constitutes a half-truth.

The legal definition is much stricter than common sense, which requires the element of "deception" in advertising to establish the illegality. According to Section 15 of the Federal Trade Commission Act of the United States, deceptive advertisements are those that are "misleading in material respect," and this has been interpreted by the courts to mean that the deceptive advertisement must affect the purchasing decisions of the customer.

Any form of commercial information or communication, which is contrary in whole or in part to actual conditions or to the acquisition conditions of the goods and services offered, or using texts, dialogues, sounds, images, or descriptions that directly or indirectly, or even by omission of essential product information, can mislead, deceive, or confuse the consumer. All forms of fraudulent advertising or abusive advertising are prohibited, as are those leading to error in the choice of the goods or services that could affect the interests and rights of the consumer.

Many economists complain that the extensive and fraudulent use of advertising involves undue costs and is a bar to free competition, with a result-

ant adverse effect on the operation of the free price system. Experts in home economics charge it with being a poor guide to consumption. Criminologists and legal scholars have noted its far more serious consequences, including death and bodily harm caused by fraudulent advertising.

On the other hand, according to the “high standard of living” hypothesis, advertising represents an economical means of exchange. It could help to lower costs because it makes possible large-scale operations in industries operating under decreasing costs. It is an essential source of product information in an advanced economy. It could actually encourage product development and technological improvement by inducing consumers to want the new and improved products offered.

Therefore, it is implied that advertising fraud could be forgiven in order to promote a high standard of living for the society as a whole. However, the argument that advertising fraud could be tolerated has lacked resources for obtaining the needed evidence based on a large-scale analysis of such a problem. Some scholars argue that advertising expenditures are wasteful by creating a demand to use up natural resources and increases the cost of products.

The history of corporations using blatantly fraudulent claims, as well as exaggerated claims, or puffery, is a long one. The roots of the tremendous growth in American advertising that took place after the Civil War were laid down over centuries of evolution in Western market places.

Ethical issues regarding advertising were seldom raised because advertising was considered merely a matter of announcing the availability of products. Even then, however, manufacturers devised and implemented skillful and boastful advertising to sell harmful drugs and other bad products. By the end of the 19th century, abuses in advertising flourished along with consumers’ suspicions about advertised food. Pure food regulation, not advertising regulation, was introduced to deal with such a problem in the second half of the 19th century.

In the United States, heightened attention to advertising’s credibility in the first decade of the 20th century foreshadowed the appearance around 1911 of an energetic truth-in-advertising movement, which initiated legislation and established organizations to combat dishonest business advertising. However, the criminal nature of the sanction, the inclusion of requirements of intent, materiality,

and other restrictive elements, and the failure to provide administrative machinery for enforcement, severely limited the effectiveness of these statutes in suppressing false or misleading advertising. More generally, the advertising industry’s desire for self-regulation has meant that prosecutions have been infrequent and convictions rarer still. Private negotiation resolved most complaints.

## REGULATION

Federal and state laws and the Federal Trade Commission (FTC) accompanied this self-regulation. In 1914, the Federal Trade Commission Act was enacted, which states that false advertising is a form of unfair and deceptive commerce. Under the act, the term false advertising extends well beyond untrue advertisements. It also includes advertisements that make representations that the advertiser has no reasonable basis to believe, even if the representations turn out to be true. An example would be an advertisement for a vehicle that states that the vehicle uses less gasoline than any comparable vehicle. The advertiser would have committed false advertising if it had no reasonable basis to believe the truth of this claim (such as through comparative tests), even if it turned out to be true.

Under the law, the government doesn’t have to prove the deceptive intentions at an administrative hearing or in court. The fact that it had a deceptive quality is sufficient. If the ad is deceptive in nature, the defendant faces legal problems even if she has the best intentions. The fact that she didn’t know the information was false is irrelevant. To determine whether or not a statement is deceptive, however, is a much more complex process, because one must not only examine the nature of the statement but also the potential effect on the customer.

The FTC Act created the FTC and gave the commission broad authority to regulate advertising. The FTC is the main federal agency that takes action against unlawful advertising. Under this broad mandate, the FTC has issued regulations prohibiting advertisements that could be misleading even if they are true. A famous example involves Anacin, a brand of aspirin. The maker of Anacin ran ads claiming that clinical tests showed that Anacin delivered the same headache relief as the leading pain-relief prescription. The ad did not mention that aspirin itself is the leading pain medicine. The FTC determined that the ad was misleading. The ad im-

plied that Anacin was more effective than aspirin, when in fact, Anacin is really just aspirin.

Over the years, the FTC has taken enforcement actions against many businesses accused of engaging in false and deceptive advertising. A significant number of those administrative actions have been tested in court. For the most part, the FTC relies on consumers and competitors to report unlawful advertising. If FTC investigators are convinced that an ad violates the law, they usually try to bring the violator into voluntary compliance through informal means. If that does not work, the FTC can issue a cease-and-desist order and bring a civil lawsuit on behalf of people who have been harmed.

The FTC can also seek an injunctive decree from the court to stop a questionable ad while an investigation is in progress. In addition, the FTC can require an advertiser to correct ads, that is, to state the correct facts and admit that an earlier ad was deceptive. For example, Listerine mouthwash was long touted as a cold and sore throat remedy. The FTC forced the manufacturer to run ads stating that Listerine would not cure colds or relieve sore throats.

The FTC has a further power, known as “fencing in.” This enables the FTC to bar misleading ads with respect to a particular product and across all of a business’s other unrelated product lines. For example, a testimonial constituting false advertising regarding product A could lead purchasers to believe that products B and C must also be great. In that case, the FTC could bar use of the ad for products A, B, and C.

Court decisions indicated that the judiciary would look favorably on commission action against dishonest advertising. By 1925, advertising cases accounted for three-quarters of the FTC’s orders. In the 1920s and 1930s, a consumer movement attacked deceptive advertising. The efforts of the consumer groups generally reinforced earlier notions that truthful information was at the heart of consumers’ needs. Consumer advocates in the interwar years showed little faith that advertising itself, even if regulated, could supply the truthful information that buyers required. Within the advertising industry, however, there were modest moves toward self-regulation, in part to stave off burdensome external controls, in part to curb what advertising people themselves considered to be persistent abuses. The American Association of Advertising Agencies, for example, devised a code of ethics for its members in

1924, but it was vague and lacked the threat of punishment.

## TELEVISION AND CONSUMERISM

Despite the clarification of its authority to take action against deceptive advertising, the FTC in these years was hamstrung by bureaucratic inertia and a cumbersome legal process. A business journalist in 1957 described the FTC as “a headless, drifting agency which acted desultorily and seldom hurt anybody very much.” The postwar years, however, saw both changes in the nature of advertising and the appearance of new critiques of advertising and consumption. Advertising volume expanded along with the booming economy, but perhaps more crucially, it employed the new medium of television to reach its audiences.

By 1960, advertisers spent over \$1.5 billion on television. The new medium’s fusion of sight, sound, and motion in living rooms forced an expansion of the concept of truth in advertising. In 1970, for example, the FTC took action against Campbell Soup for a commercial for vegetable soup, in which the photographers had put clear marbles at the bottom of a bowl to make the soup’s ingredients rise to the top and appear more abundant. Campbell agreed in a consent order to discontinue the procedure.

These changes set the stage for a revival of consumerism and new efforts to control advertising during the 1960s. Consumerists had long complained that the FTC and other regulatory agencies shared a revolving door with regulated businesses. Although self-regulation and government control had recognized some of the new problems, the major challenge to policy makers was to find appropriate ways to curtail the fraudulent abuses in advertising.

Awakened from its postwar torpor by some sharp consumerist attacks, the FTC emerged by the early 1970s as a more energetic regulator of advertising practices. The FTC had broadened the definition of advertising fraud from the Progressive Era’s fixation on literal truth. It began a program requiring advertisers to provide information substantiating the claims they made in their publicity.

Failure to supply adequate evidence, in the judgment of commission staff, could bring about a charge of deception or unfairness. Indeed, the FTC articulated a principle stating that advertising claims

that lacked a “reasonable basis” for belief were unfair practices.

It was, however, nowhere near the solution to the problem because the FTC had not been given the legal instruments or the staff necessary to effectively administer and monitor advertising. Moreover, in many cases, the FTC relied heavily upon making deals with companies, in the form of consent orders, to halt misleading or false advertising. In 1971, consultation among advertisers, agency, and media interests bore fruit in the creation of a new self-regulatory system. The scheme designated the National Advertising Division (NAD) of the Council of Better Business Bureaus as an investigating body and created a National Advertising Review Board (NARB) to evaluate complaints about advertising.

The purpose or mission of the NARB, as explained in its Statement of Organization and Procedures, is to “sustain high standards of truth and

accuracy in national advertising.” In reviewing advertisements, if a panel of the NARB decides that an advertisement is misleading or deceptive, it will request that the advertiser modify or withdraw the ad. If the advertiser “fails to respond or indicates his unwillingness to accept or comply with the decision, the panel will issue a Notice of Intent to the advertiser that the matter will be publicly referred to an appropriate agency of government.” The NARB therefore serves as a self-regulatory agency, monitoring the activities of companies and agencies alike.

### ADVERTISING GROWTH

At the same time, advertising has expanded rapidly since the 1970s. In 1973, advertising expenditures amounted to \$25 billion, and by 1993 had increased to over \$110 billion in the United States. Since the mid-1970s, however, pressure for deregulation has partially stymied governmental and industry efforts to regulate advertising. The FTC has been attentive to business protests against its actions and hostile to governmental regulation against false advertising. The FTC was reluctant to pursue deceptive and unfair advertising cases during the Ronald Reagan years in the 1980s. Chairman James Miller of the FTC in the Reagan administration, for example, asked Congress to enact a restrictive definition of deceptive advertising. When Congress rejected this path, a majority of the commissioners voted to apply it anyway in FTC work. These standards required a showing of “likeliness to mislead” the “reasonable” consumer about “material” matters rather than incidental ones.

On the other hand, consumers became impatient with misleading and deceptive advertising, tired of being treated like pawns in a market grid box, and of being intellectually abused by a bombardment of inane and degrading advertisements. In almost every piece of merchandise a consumer buys, she is influenced consciously or unconsciously, directly or indirectly, by advertising. Some scholars declared that all advertising is deceptive because it is designed to manipulate. The major part of informative advertising is, and always has been, a campaign of exaggeration, half-truths, intended ambiguities, direct lies, and general deceptions. In a Gallup poll on the honesty and ethics of people in 32 different professions, advertising and advertising practitioners ranked near the bottom. False nutri-

*Used-car dealers have been known to employ deceptive advertising in luring customers to car lots.*

tional claims and falsified demonstrations are just two illegal aspects of advertising and product promotion, which is a \$100 billion a year business in the United States.

#### LANHAM ACT AND STATE LAWS

In addition to the FTC under the FTC Act, private parties, such as consumers or competitors, can also bring a legal action regarding false advertising under the Lanham Act. To establish a violation under the Lanham Act, consumers and competitors must prove the following: 1) the advertiser made false statements of fact about its product; 2) the false advertisements actually deceived or had the capacity to deceive a substantial segment of the target population; 3) the deception was material; 4) the falsely advertised product was sold in interstate commerce; and 5) the party bringing the lawsuit (the plaintiff) was injured as a result of the deception.

Actual loss is not required to show an injury. All that is needed is a reasonable basis for the belief that the plaintiff is likely to be damaged as a result of the advertising in question. An example of such damage would include ads that deceive consumers who are the target population of both the advertiser and the plaintiff. The penalties for a Lanham Act violation include the plaintiff's lost profits, the additional profits to the advertiser resulting from the deceptive ad, treble damages, and attorneys' fees.

In addition to the FTC Act and the Lanham Act, which are federal statutes, most states also have laws proscribing false advertising. For example, Illinois has enacted the Uniform Deceptive Trade Practices Act. Under the act, a "deceptive trade practice" includes such practices as "palming off," misrepresentation, product disparagement, and bait-and-switch advertising.

Palming off occurs when an advertiser creates the impression that its goods or services are those that are furnished by a competitor. For example, this could occur if you set up a hamburger stand that looked like a McDonald's restaurant. Misrepresentation occurs when an advertiser makes false or misleading claims about its goods or services, as under the FTC Act and the Lanham Act. Product disparagement occurs when an advertiser intentionally makes false or misleading negative remarks about competing goods or services, causing its competitor to lose sales. Bait-and-switch advertising occurs when the advertised goods or services are

withdrawn from the market and substitute goods or services are instead offered for sale.

Most states have laws, usually in the form of consumer fraud or deceptive practices statutes that regulate advertising. Under these laws, state or local officials can seek injunctions against unlawful ads and take legal action to get restitution to consumers. Some laws provide for criminal penalties, such as fines and jail, but criminal proceedings for false advertising are rare unless fraud is involved.

Consumers often have the right to sue advertisers under state consumer protection laws. For example, someone who purchases a product or service in reliance on a false or deceptive ad might sue in small claims court for a refund or join with others to sue for a huge sum in another court.

A competitor harmed by unlawful advertising, or faced with the likelihood of such harm, generally has the right to seek an injunction and possibly an award of money (damages) as well, although damages are often difficult to prove. Such cases usually are based on one of two legal theories: unfair competition or commercial disparagement. Despite these different laws which deal with advertising fraud, the most powerful tool is still the FTC Act in the United States. Some scholars noted that prosecutions of false advertising cases had proven difficult under the fraud laws due to the absence of major, highly motivated victims and problems of proving intent and damage. Some argue that the FTC action against advertising fraud can be improved if the government facilitates the agency with more staff and resources, as well as political support.

In fact, the difficulty of proof and the trend of lenience toward advertising fraud cases can be found in many countries in the world. For example, in Canada, each year thousands of allegedly false, misleading or deceptive advertisements are reported to the Department of Consumer and Corporate Affairs.

The number of files of advertising illegalities opened went from 33 in 1968–69 to 12,374 in 1987–88. However, only a small number of the cases resulted in recommendations to the attorney general for criminal prosecution. There have been very few convictions against advertising fraud.

## Africa

AS ONE OF THE last parts of the world to strive for an advanced capitalist economy, Africa was also one of the last to develop a significant international business elite. Until the wave of decolonization following World War II, the countries of Africa were more often the victims of corporate and government malfeasance, and mismanagement by countries outside of the continent. Only recently have these countries, especially South Africa, faced the challenge of holding the reins on economic crimes in times of political transition and economic globalization.

White-collar crime is a Western concept and is not always easy to apply to the various societies of Africa, whose ideas of both crime and economics can be radically different. For example, western African customs long supported the dash system, in which government officials performed their duties in return for tips, or dash. When Western corporations sought to do business in countries such as Nigeria, it was expected that they would also participate in the system and provide dash in order to grease the gears of business. The local elites saw this as tradition not as bribery, but through Western eyes it fits the definition of white-collar crime.

West Africa became firmly linked to the nascent global economy in the late 16th and early 17th centuries with the advent of the Atlantic slave trade.

The trade originated with the Portuguese, who sent government-backed missions to Africa to procure gold for trade with Asia. Once the other Europeans learned of the market for slaves, competition increased and a number of joint-stock companies, notably the Dutch West India Company (WIC), based their existence on the profits from the triangular trade between Africa, Europe, and the Americas.

## THE CORPORATE SLAVE TRADE

Initially, these companies were not strictly-speaking exploitive, as they tapped into already existing networks for procuring and selling slaves, but their involvement increased the intensity of the trade and contributed to profound political changes. Along the west coast of Africa, leaders used the profits and prestige of the Atlantic slave trade to consolidate their power over tribe members and to extend that power over others. The trade created and strengthened an economic and political elite who often leveraged their positions for personal gain, a trend that would continue in the 20th century.

The large profits from the slave trade also encouraged economic recklessness back in Europe. In the 18th century, two spectacular stock market bubbles, the Mississippi Scheme in France and the South Seas Scandal in England, stemmed from the creation of joint-stock companies whose profits were to come from the slave trade. John Law's Mississippi Company failed spectacularly, leaving France with massive debt, a general mistrust of financial instruments, and lingering concerns about the government's ability to manage its finances. The fallout from the scandals had little effect back in Africa because competition for lucrative and exclusive slave-trading contracts was intense, and when one player dropped out or proved unsatisfactory, there were always others waiting in the wings.

Slavery was outlawed by nearly every Western country by the 19th century and many expected that Africa would follow suit. When this proved not to be the case, imperial powers cited the continuation of slavery as a moral pretext for greater control by paternalistic, economically advanced countries. In the late 19th century, nearly all of Africa was carved up by European powers into spheres of colonial rule. The cooperation of African leaders was assured through the financial and political incentives, often thinly disguised bribery. The primary purpose of these colonies,

however, was economic. Europeans were looking for new markets for their own manufactured goods and new sources of key raw materials, such as copper or oil.

### CRIMES OF IMPERIALISM

Whether or not new imperialism could be called a crime is a hotly debated subject. Defenders of the idea point to the essentially exploitative nature of colonial interests. Imperial powers would extract valuable raw materials from their dependencies, but for use and profit of the home country only. The enterprises would provide little extra employment for the natives and even less tax revenue. Once they became independent, the countries of Africa would find themselves "looted" of their most valuable resource and with very little capital to show for it. Colonialism also heightened the previously existing distance between the economic elites and the rest of the population. More than ever, economic power came with collusion with the West.

When the colonial powers became distracted by the triple catastrophes of World War I, the Great Depression, and World War II, African countries gained increasing degrees of independence and by the 1960s, most were at least nominally independent of their former masters. In addition, the global economic boom that followed World War II resulted in rapid economic growth for most of Africa. This combination of new governments and economic change proved to be very volatile. With little experience in managing export-oriented industries, many new leaders found themselves relying more on customary relations than development theory. Warring tribes struggled for political and economic control and national loyalties were often weak or nonexistent. Political corruption ran rampant, especially in sub-Saharan regions, and was called "the most destructive of Africa's moral diseases."

### NIGERIA

Nigeria provides an interesting case study. It became independent in 1960, but almost immediately violent rebellions erupted among the different tribes, each demanding their own state. The country was divided into 12 states (later 19), resulting in an unstable federation. Government officials remained loyal to their own tribes. After a rigged election in 1966, civil war ensued, to be replaced by military

government. Nigeria was fortunate to have large oil reserves and the sale of oil constituted the bulk of Nigerian government revenue by 1979. With renewed confidence from the civil war and military rule, several Nigerian officials began awarding contracts to foreign corporations in return for substantial kickbacks. According to analysts, "most Nigerians believe[d] that their government ministers, civil and military, systematically take a rake-off on government contracts." Some scholars have contended that at different times the Nigerian government used its position essentially to collect bribes, resulting in major transfers to personal accounts in foreign countries.

### GHANA, UGANDA, ZAMBIA

Different countries dealt with the rampant corruption in various ways. Military or one-party dictatorship was one option. In Ghana, Colonel Ignatius Kutu Acheampong seized power in 1972 after civilian government proved unable to deal with widespread political corruption, especially smuggling by officials. His regime showed that military regimes were no better equipped to handle the problem than nonmilitary governments and he was quickly deposed.

In Uganda, Idi Amin, a former general, took over power in 1971. Amin had been accused of large-scale smuggling and misappropriation of funds while serving previous governments, though he used his influence to exonerate himself. He then used the money gained from these activities to increase his personal control over the army, making his coup possible. He quelled ethnic conflicts in the country by eradicating members of rival tribes, the Acholi and the Lango, and by forcibly expelling Uganda's economically dominant Asian minority.

In Zambia, President Kenneth Kaunda dealt with corruption from a Christian-inspired moral perspective (his father had been a minister). For example, he fired his minister of labor for being involved with a company that had received many questionable loans from the government. In a celebrated case in 1970, he suspended numerous others for misuse of government revenue. His one-party state, however, did not enjoy widespread support.

Many countries dealt with corruption by instituting greater state control over the economy, sometimes with socialist overtones. War-time conditions had greatly increased the power of the state to regu-

late the economy. African leaders often expanded this power to include marketing boards, government ownership of industry, and increased exchange and price controls. In North Africa, the creation of the OPEC (Organization of Petroleum Exporting Countries) cartel in 1960, as a means of leveraging the oil resources of nations such as Libya, Algeria, and Nigeria, was a significant contribution to corruption. These policies favored the dominance of an economic elite and often had deleterious effects on small producers, especially in agriculture. They also created the opportunity for further political corruption in the form of selling government contracts, licenses, monopolies, or other inside deals in return for cash payments.

Beginning in the 1980s, problems with debt and exchange rates forced many African countries to adopt stricter policy controls from international institutions, notably the IMF (International Monetary Fund) and the World Bank. Along with these changes, political reform and democratization have also advanced. Many of Africa's more notorious dictators, such as Uganda's Amin, have been overthrown, resulting in more open government.

#### REFORM AND CORRUPTION

New and reformed regimes have also had problems with corruption. In July 2002, for example, President Ange-Felix Patasse of the Central African Republic had 20 government officials arrested for embezzlement. In Malawi, the IMF has accused the president of illegally selling grain reserves shortly before a major drought, and in Angola rampant corruption has frustrated the efforts of humanitarian workers to restore services after the civil war.

In the later 20th century and early 21st, corruption and white-collar crime have become less internal to the government systems and increasingly linked to relationships with multinational corporations. In 2003, the president of Nigeria accused several multinational oil companies of taking some \$600 billion in illegal tax bonuses. In 1992, the Khalifa family, based in Algeria, began taking advantage of new open markets to create a worldwide empire, including the first private Algerian bank, an airline, two television channels, and companies specializing in catering, rental cars, graphic design, and construction. Economists reckoned the collective worth of the group to be close to \$2 billion annually. In 2001, the group came under government sus-

picion and transfers were suspended. While leaving the country, three bank managers were apprehended with large suitcases full of cash. Since then, the Algerian government has suspended the operations of most of the other branches of the group, laying off thousands, and the leader, Ralik Khalifa, has gone into hiding.

#### SOUTH AFRICA

In South Africa, the transition from apartheid to the rule of the African National Congress (ANC) coalition has been difficult and all types of crime, including white collar, have been on the rise. In one of the most publicized cases of such crime, Winnie Mandela, former wife of ANC founder Nelson Mandela, faced 85 charges of fraud and theft in 2002. Using her control over the ANC's Woman's League, Mandela helped to forge letters with the purpose of getting bank loans for the organization.

Convicted of most of the charges, she was sentenced to five years in jail. Despite the existence of numerous organizations designed to fight white-collar crime, corporate and government scandals have also proliferated. In 2001, a project to modernize the South African armed forces resulted in the distribution of numerous lucrative contracts and allegations of significant kickbacks and favoritism among government ministers. Similar accusations were made regarding the purchase of HIV/AIDS

*Cape Town exemplifies the post-apartheid South African economy fraught with its share of corruption.*

drugs. The credibility of government officials was also tarnished by a scandal over diamond and land rights involving the New Diamond Corporation and the acceptance of bribes from Taiwanese officials designed to block South African recognition of mainland China.

On the other hand, the government has accused South African chemical company SASOL of conspiracy and dishonest practices in connection to its cooperation with German banks. In 2002, the principle managers of South Africa's second largest trade union, Nehawu, faced charges of theft and fraud when a government audit found over 500,000 rand missing from its accounts.

#### ADVANCE FEE FRAUD

Perhaps the most infamous white-collar crime to come out of Africa in recent times is the Nigerian Mail scam. Using an official-looking structure and language, the e-mails suggest to the unwary that they help a Nigerian official to recover funds by providing bank account information. In return for the users' cooperation, they will get a percentage of the recovered funds, often millions of dollars. Fraudsters, working largely at internet cafes in Nigeria and other African countries, have sent millions of these e-mails. Many have been successful, though the exact amount of funds unwary volunteers have forfeited remains unknown. The scam has attracted a host of imitators in other African countries.

## age discrimination

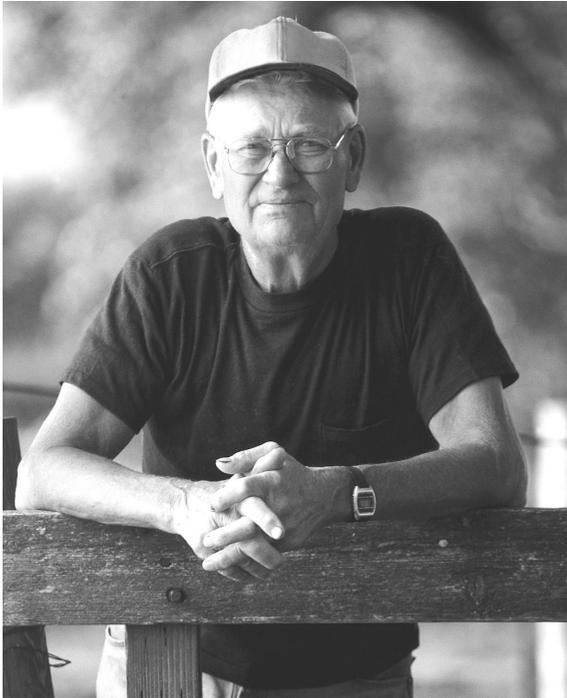

IN THE UNITED STATES, age discrimination is generally associated with old age, but there is discrimination against youth as well. Ageism really was not evident in America until industrialization began, shortly after the Civil War. It reached its zenith when a 1907 veterans law declared that all people over age 62, regardless of their actual state of health, were disabled.

The second cause of age discrimination against the elderly was the Social Security Act of 1935. Ironically, the law was designed to help older people enjoy their "golden years" by providing them with a guaranteed, although meager, pension. Unfortunately the law had the effect of forcing many older Americans out of the labor force after age 65, a practice not made illegal until 1967 with the passage of the Federal Age Discrimination Act.

American society possesses a phobia about aging and being elderly. One reason for the aging phobia concerns the way the mass media obsesses over youth and virtually ignores the elderly or portrays them in a negative light. Numerous studies demonstrate that the elderly are virtually invisible in much of the media.

#### ELDERLY MYTHS

Because their lifestyles and social problems are ignored, mythical stereotypes about their physical, mental, and moral conditions abound: The elderly are senile, mentally ill, or suffer from declining intelligence; the aged are lonely and unhappy to the point of being miserable; the elderly are chronically sick; the aged are unable to live by themselves; the elderly become ill upon retirement; most of the aged are poor; older people are asexual and uninterested in sex; most of the elderly live in nursing homes; the aged are unproductive and a drain on society. These are all myths.

*Age discrimination is mostly based on myths about old age that ignore the vitality of many senior Americans.*

## OLDER AMERICANS ACT

One major attempt to resolve some of the elderly's social problems is the Older Americans Act (OAA, last amended in 2000). This federal law provides the funding and policies for state and area agencies on aging to identify the elderly's needs and provide services that meet those needs. Community providers furnish delivered meals, transportation, information and assistance, outreach, legal assistance, ombudsman services and many others under the act. It does not set specific funding authorization levels, but requests Congress to approve "such sums as may be necessary." The exceptions to this are the family caregiver support component, programs for Native Americans, and older workers funding all set at specified levels. However, funding authorization does not mean actual appropriation. The OAA has historically been funded far below authorization levels.

Other functions of the act include emphasizing the importance of information and assistance services. It creates a hotline for the dissemination of information about retirement, and requires area

agencies on aging (AAAs) to report annually to the state agency regarding needs of older persons and service provision. AAAs must coordinate community-based and long-term care services to enable older individuals to remain in their homes. AAAs must also provide a grievance procedure for older individuals who are dissatisfied with their services.

The act also contains a Senior Community Service Employment Program (SCSEP) to develop individual economic self-sufficiency for seniors through community service activities for unemployed, low-income persons who are 55 years of age and older and have poor employment prospects.

## EMPLOYMENT DISCRIMINATION

A federal law passed in the 1960s prohibits discrimination against the elderly in the job arena. Another paradox of ageism in America, however, is that the number of job discrimination suits filed by elderly persons has reached an all time high. Age discrimination is a particular problem for blue-collar workers employed in declining industries, such as automobiles and aerospace.

Since 1990, cases of forced retirement and outright firing have been filed on behalf of older workers in a broad variety of fields, such as real estate, television news broadcasting, and investment. The bitter truth is that older workers are frequently at the top of the pay structure within most companies, and forcing them out, while retaining younger, less costly workers, is a deviously rational economic act in an age of restructuring and down-sizing.

The elderly suffer very high rates of victimization from white-collar crimes, especially scams (confidence games) and frauds. Amazingly, nine out of 10 fraud victims do not report crimes against them to the police, largely due to personal embarrassment or the smallness of the particular, individual loss. The abuse of elderly people in America is a recently discovered and serious social problem that includes several forms of maltreatment. Physical abuse can include everything from pushing and shoving to rape and assault. Psychological abuse consists of threats, verbal intimidation, and isolation. Many elderly also suffer from neglect, deprivation, inadequate medical care, poor nutrition, and other essential goods and services. The elderly are also prone to financial exploitation, wherein their money is mismanaged, misused, squandered, or stolen.

Finally, there are serious problematic conditions in America's nursing home system. While there are many fine nursing residence units in the United States, a minority of these institutions have been involved in scandals that have caused the public to distrust all nursing homes. Additionally, tens of thousands of deaths in nursing homes occur each year do to the side effects of prescribed drugs. In some cases these are improperly administered.

#### YOUTH DISCRIMINATION

Though not within the strict parameters of white-collar crime, age discrimination against youths echoes criminal discrimination against the elderly. Within families, children are the least powerful and most unprotected members. About one in every six children in America is a victim of incest, physical and/or psychological abuse. One-third of the victims of physical abuse in the United States are babies, and at least 5,000 children die from child abuse each year.

Children face abuse not only from inside the family but outside as well. The most recent notorious examples concern sexual abuse by Catholic clergy and daycare center personnel. For example, between 1984 and 2002, the American branch of the Roman Catholic Church paid \$1 billion in settlements of child molestation incidents involving priests.

Over three million American children (one in six under age seven) have dangerous levels of lead in their bodies from paint chips and dust. Each year, gunshots, drownings, and bicycle and motorcycle injuries kill 8,000 American children and permanently disable 50,000. Each year, an estimated 1.3 million children leave home. A growing number (around 10 percent) are "push outs" who leave because their parents refuse to let them live at home, but most leave without parental permission. At least 50 percent of homeless children were physically or sexually abused before leaving home, and push out runaways report more violence and conflict with parents.

Nothing quite attests to the alienation of America's youth as the unemployment rate among teens, versus that of adults. In 2003, unemployment rates were just over 6 percent for adults 20 and over, just one-third of the teen unemployment rate. Poor teens suffer unemployment rates averaging just over 30 percent, compared to rates of 11.2 percent for

poor adult males and 10.5 percent for poor adult females.

## Agnew, Spiro T. (1918–1996)

ON OCTOBER 10, 1973, Spiro "Ted" Agnew became the first vice president of the United States to resign because of scandal. Agnew's resignation had nothing to do with the Watergate scandal that had been brewing in the nation's capital since the discovery of the break-in at Democratic party headquarters on June 17, 1972, and was followed less than a year later by the resignation of President Richard Nixon. If Agnew had been more honest, he would have become the 38th president of the United States. Instead, Gerald Ford, who had been nominated by Nixon as Agnew's replacement, succeeded to the office of president when Nixon resigned on August 9, 1974.

The troubles that led to Agnew's resignation could be traced back to his home state of Maryland. State attorneys in Baltimore maintained that Agnew had taken bribes for government contracts, first as a Baltimore county executive and then as governor of Maryland. Agnew responded that the accusations were all "a pack of lies," and insisted that he had become accustomed to "unsubstantiated charges, rumors, innuendos, and speculation" since he had entered political life.

In the early days of the investigation, Agnew never allowed himself to believe that the Nixon White House would not be able to protect him from federal investigators and federal courts. He insisted until his death that he had done nothing

wrong because accepting money for political reasons was “just the way things were done in Maryland.”

Agnew had developed an antagonistic relationship with the media, and they were only too ready to turn the attack on him when reports began to surface that he was under investigation for possible conspiracy, extortion, bribery, and tax evasion. Once he understood that the investigation would proceed, Agnew considered asking the House of Representatives to draw up charges of impeachment. He believed that once he was impeached and on trial before the Senate, public opinion would be on his side. Initially, Nixon was opposed to the idea but later seriously considered it.

However, Agnew’s team of lawyers contended that he should seriously consider a plea bargain to bring the scandal to a speedy and dignified end. The prosecutors agreed, and the bargaining process began on September 13, 1973. Even though Agnew would have liked to trade his resignation for having the charges against him dropped, it was never a real option for the prosecutors. Agnew’s lawyers negotiated a deal by which he could plead *nolo contendere* (no contest) to the single charge of income tax evasion and render his resignation as vice president of the United States in return for a promise that he would never have to serve any time in jail. The charge of *nolo contendere* is used when a defendant refuses to admit guilt but accepts punishment as if guilt were established. One condition of the agreement was that the vice president would waive his Fifth Amendment right to refuse to testify against himself. Agnew was fined \$10,000 and sentenced to three years probation.

In 1980, Agnew published his memoirs, *Go Quietly Or Else*. In the book, he reiterated his claims of innocence: “I am innocent of the allegations against me which compelled me to resign from the vice presidency of the United States in 1973.” The former vice president insisted that he had been removed from office by liberals who resented his conservative views.

Despite his pleas of innocence, Agnew admitted that he had taken payments while serving in political office in Maryland, but he again claimed that the money had not been intended to curry political favors. Agnew moved to California where he tried to claim a tax deduction for the fines he had been forced to pay the state of Maryland. His request was denied. In California, the former vice president

discovered that he had the right connections for a successful career in developing American business deals for foreign governments.

## air pollution

PUBLIC RECOGNITION of the harmful nature of air pollution arose in the United States in October 1948 when, over a five-day period in Donora, Pennsylvania, an air pollutant emission lead to 19 deaths. Additionally, 10 percent of the population of Donora was severely affected by the exposure that was compounded by the effects of weather keeping the pollutants at ground level.

International attention to the issue of air pollution developed in 1952 when, in London, England, particulate matter and sulfur dioxide built up over a three-day period and caused 3,000 to 4,000 deaths. For decades the lead and chemical industry subjected workers and the public to a variety of hazardous air pollutants by withholding industry data reflecting its harmfulness and even developing trade associations designed to lobby legislatures, intimidate independent researchers, sponsor scientists to lie to the public about harmfulness of lead in the body, and pressure hospitals to withhold evidence about industrial poisoning of workers and the air.

The federal government began to legislate against air pollutants in the late 1940s and 1950s, but it wasn’t until 1970 that the Clean Air Act was passed mandating controls over the concentration and emission of a variety of pollutants, primarily those recognized as carcinogens and irritants. Polluting the air is against the law in the United States and has been since the Clean Air Act was passed. Although some types of air pollution are naturally

occurring, such as that emanating from volcanoes and the decomposition of vegetation, the most problematic forms of air pollution come from industrial sources including fossil-fuel fired electricity and a variety of manufacturing plants worldwide.

And although automobile and diesel exhaust remains a primary pollutant of the air, industrial air pollution remains one of the most significant sources of air pollution and remains a serious problem in the United States and globally. When air pollution exceeds allowable legal limits, or when forbidden chemicals are released or emitted into the air, this is a form of white-collar crime referred to as environmental crime. Like many other white-collar crimes, much of this air pollution is the result of industrial attempts to increase power and profits.

## CASE STUDIES

Another early case of air pollution involved Allied Chemical Corporations's production of Kepone, a toxic pesticide, related to DDT, that caused kidney lesions, liver problems, and nervous-system damage in laboratory animals. Allied Chemical initially licensed other companies to produce Kepone until 1966 when increased demand led Allied Chemical to manufacture Kepone at its plant in Hopewell, Virginia. This continued until 1973 when a new corporation, Life Sciences Products Inc., was formed by former employees who had the sole rights to continue the production of Kepone through 1974.

Conditions at the plant were poor and workers were constantly exposed to Kepone in the air. Within two weeks, workers at the plant began showing symptoms of exposure, and in two months the local sewage plant was found contaminated by the illegal dumping of Kepone by the plant. One year later, the plant was shut down after finding Kepone in a worker's bloodstream. In the end, more than 133 workers developed a variety of illnesses. Additionally, Kepone was found in air samples as far away as 64 miles from the plant. It was also found in fish and oysters nearby. Thousands of pounds of Kepone still lie on a nearby riverbed.

Two corporate officers pled guilty to over 100 counts of criminal violations of the Water Pollution Control Act, were fined \$3.8 million each and placed on five years' probation. Allied Chemical, convicted of crimes from its own misconduct in producing Kepone from 1971 to 1974, was fined \$5 million for over 940 counts and was forced to do-

nate \$8 million to the Virginia Environmental Endowment and clean up the remaining pollution. However, such costly burdens, as scholars point out, are borne by the stockholders of the corporation not the corporation. It was also found that the local Water Quality Control board as well as the Air Quality Resources Board, and OSHA and EPA investigators knew about the Kepone situation and failed to take action. But only the city of Hopewell was fined and given five years' probation.

The international trade in pesticide involves companies like Dow, Shell, Chevron, Bayer, Monsanto, Dupont, and Union Carbide. As far back as 1982, the international trade of pesticides has been big business. Then, 25 percent of pesticides exported by U.S. companies were banned, restricted, or unregistered for use in the United States due their hazardous nature. A variety of pesticides for lawn and garden use remain unsafe or untested. Other forms of environmental crimes are suspected in the extinction of over 300 species of animals, birds, fish, reptiles, amphibians, snails, clams, crustaceans and insects.

Union Carbide perpetrated one of the worst global incidents of air pollution in 1984. Union Carbide's Bhopal, India, plant released a harmful gaseous chemical, called liquid methyl isocyanate, after allowing a number of drums to rust and decay, while not making proper safety precautions to prevent injury and death. Union Carbide also failed to develop proper warning procedures for workers or local townspeople. The gas spread to the local community and the death toll was initially 3,415 lives, but eventually that figure increased to 10,000 with 200,000 more injured, and 40,000 of those seriously injured. Not until 1989 did Union Carbide settle out of court with victims' families and the Indian government for \$480 million. In 2003, only one-third of this money had been received. In 1999, seven Union Carbide employees went on trial in Bhopal for negligence. However, back in the United States, Union Carbide recovered financially by the 1990s and successfully merged with Dow.

## CLEAN AIR ACT AMENDMENTS

Through the years, the Clean Air Act has been amended several times with the last amendment passing in 1990. One of the most important elements of the Clean Air Act includes the conditions specified in the National Ambient Air Quality Stan-

dards (NAAQS). This requires the Environmental Protection Agency (EPA) to identify pollutants that “may reasonably be anticipated to endanger public health or welfare” and to issue air quality criteria.

The criteria must reflect the latest scientific knowledge and are set up by independent scientific review panels that consolidate the most current scientific research. Other data collected include that which help provide a better understanding of the nature, sources, distribution, measurement, and concentration of these pollutants. The EPA reviews the NAAQS every five years. These standards are of a short-term and long-term nature. There are primary standards designed to take into account the health of sensitive populations such as children, asthmatics, and the elderly, while the secondary standards are designed to protect against damage to animals, crops, vegetation, and buildings. As a result there are six hazardous air pollutants defined as contaminants, with EPA mandates for minimal levels of exposure into the air.

## POLLUTANTS

These include combustion related pollutants like nitrogen oxides, carbon monoxide, and a number of sulfur oxides including sulfur dioxide, a combustion related zone pollutant called O<sub>3</sub>, and lead referred to as criteria pollutants. Many of these pollutants come from industrial sources including coal gasification and fossil fuel power plants, and waste incinerators. Furthermore, many of these are associated with lung cancer. Additionally, fossil-fuel fired electric power plants emit a variety of carcinogens including chromium, nickel, and radionuclides.

Other carcinogens include carbon particles, particulate organic matter (or POM) that includes Polycyclic Aromatic Hydrocarbons (or PAH) and benzopurene. PAHs are also associated with lung cancer, particularly among workers exposed in steel plants, urban dwellers, and coal miners. Sulfur dioxide and oxides of nitrogen are produced through the combustion of fossil fuels that are then converted to further air pollutants once in the atmosphere.

Among studies that also control for individuals who smoke tobacco, the relationship between exposure to air pollution or industrial exposure to toxins and cancer remains strong. Air pollution from steel mills and municipal solid-waste incinerators

lead to increases in lung, stomach, liver, and colon cancer. Also the International Agency for Research on Cancer (IARC) has classified strong sulfuric acid aerosol as a human carcinogen among heavily exposed occupation groups. Butadiene, a volatile organic compound used since the 1930s in the synthetic production of rubber and emitted in automobile exhaust is also classified by the IARC as a probable human carcinogen. Aldehydes emanating from the combustion of gasoline and diesel fuel are also classified as hazardous air pollutants.

Volatile organic compounds are chemicals emitted from both human-made and naturally occurring sources including automobiles, chemical plants, oil refineries, factories, and consumer, commercial products, and plants. These react with nitrogen oxide to form O<sub>3</sub>, which can develop from sources hundreds of miles away. While O<sub>3</sub> is a primary pollutant regulated by the EPA and the NAAQS, about 48 million people live in 77 counties where O<sub>3</sub> levels exceed the national standards. Most of these concentrations are in Houston, Texas, Los Angeles, California, in the Gulf Coast areas, and the north-eastern and north-central states.

However, some improvements in air quality in the United States have been made. For example, all monitoring locations across the country have met the standards emission criteria for nitrogen dioxide from 1992 to 1997. Nonetheless, other problems with pollutants exist and include the development of greenhouse gases responsible for the depletion of the ozone layer of the atmosphere.

One of those is carbon dioxide, released into the atmosphere from the manufacture of aluminum and steel as well as the production of fossil fuels (coal, oil, and natural gas). Another pollutant that harms the ozone layer is chlorofluorocarbons (CFCs) and, while it is illegal to sell this substance, it is the second most valuable commodity traded out of Miami, Florida, next to cocaine. CFCs are used as refrigerants and aerosol propellants and are also found in air conditioning units.

Carbon monoxide emissions decreased in the United States from 1988 to 1997, with the exception of three large counties in which over 9 million people lived. Most carbon monoxide emissions are from car exhausts, but other sources include industrial processes and other forms of fuel combustion. Lead emissions have also dropped by 98 percent between 1970 and 1997 due to use of unleaded gasoline for autos. However, the highest concentrations

of lead are now found around nonferrous smelters and other industrious stationary sources.

### POLLUTANTS IN CONCERT

Carbon monoxide effects are usually isolated to specific occupational groups but the effects of carbon monoxide cannot be separated from the effects of other pollutants. The effects of nitrogen oxides, usually occurs in concert with other pollutants, but by itself can combine with water in the lungs to form nitric and nitrous acids that are believed to damage the lung oxidation mechanisms. At high concentrations, nitrogen oxides can cause fatal pulmonary edema and pneumonia. Much exposure to this chemical comes indoors from gas ovens and space heaters, but one can also be exposed while driving in traffic.

The EPA also regulates what are called hazardous air pollutants, also referred to as toxins, and industries are required to use technology to limit the emissions of such chemicals. Some of these industrial air pollutants have been linked to cancer, including particulate matter (PM), monitored by the EPA since 1988, that can be inhaled into the lungs. PM includes solid or liquid particles in the air, and although some PM is natural like pollen, PM is also produced from fuel combustion activities. Larger particles tend to come from natural sources while smaller particles tend to come from industrial sources.

These smaller particles tend to lodge deeply within the lungs while the larger particles will deposit in the upper airways. Prior to 1988, the EPA only measured total suspended particulates (TSP) and that included particles too large to be inhaled into the lung. PM also has deleterious effects on those individuals with asthma, lung diseases, and heart diseases. Particulate matter has been found to be significantly related to cancer mortality rates in multiple studies.

Other effects include emergency room admissions for a variety of cardiovascular problems as well as pneumonia and respiratory ailments. While decreases in these particles have been noted from 1970 to 1980, little change has occurred since 1990. From 1988 to 1995, the annual mean concentration of PM<sub>10</sub> has dropped by 17 percent, but recent trends are not known.

Finally, the EPA also controls emissions of sulfur dioxide and nitrogen oxide in order to reduce

*Fossil fuel production, such as an oil refinery, is the greatest air pollutant in the United States and worldwide.*

the production of acid rain. Fossil fuel combustion accounts for 85 percent of all U.S. sulfur dioxide emissions. Many of these dangerous chemicals, including sulfur dioxide and particulate matter, and acid aerosols, usually have common industrial sources. Many industrial air pollutants are carcinogenic and include those emanating from the combustion of fossil fuels for both transportation and power generation.

One such chemical includes polycyclic organic matter or POM. POM comprises a variety of chemical compounds including polycyclic aromatic hydrocarbons (PAHs) and nitroPAHs. These are released into the air by combustion processes including, fossil fuel combustion, diesel engine emissions, tobacco smoke, grilling meat, and chemical and photochemical reactions in the outdoor environment. One form of POM includes benzoaprene. PAHs are associated with increased risk for lung cancer in a variety of occupation settings including coke-oven workers in the steel industry and coal gasification workers. Some of these toxic substances that are not considered primary pollutants are also negatively related to health and positively related to mortality.

And while air quality has improved in the United States since the 1970s, 52 million people still live in counties across the country where the air quality does not meet the required standards for at least one primary pollutant. Additionally, many developing nations across the globe are also suffering from air pollution at levels higher than current levels in the United States. This is primarily the result

of economic globalization and the movement of transnational corporations to third world and developing nations where environmental laws are less stringent or nonexistent.

The EPA has been responsible for evaluating the risk of over 189 hazardous air pollutants emanating from specific point sources since the Clean Air Amendment Acts of 1990. Most of their data on outdoor air pollutants is not usually gathered from point sources. However, scientific studies have examined differences in industrial air pollutants between urban and rural areas as well as areas in closer proximity to industrial pollutant points and hazardous waste sites, and continue to find increased risk for cancer for people in urban areas, workers exposed to the above pollutants, and people living in closer proximity to hazardous waste sites and steel and power plants.

Since 1981, the World Health Organization under the United Nations Environment Program and the Global Environmental Monitoring System has been monitoring a variety of air pollutants including total suspended particulates as well as sulfur dioxide (the relationship between simultaneous levels of both these chemicals in the environment is quite high). Both have been found to be predictive of daily cardiovascular mortality levels resulting from air emissions from industrial activities and coal-burning especially in developing nations.

The trade in ozone-depleting substances has been illegal since 1987 in concert with the Montreal Protocol on Substances that Deplete the Ozone Layer. Two newer international laws also prohibit specific types of air pollution but neither is currently in force, this includes the 1998 Rotterdam Convention that prohibits the use of certain chemicals and pesticides, and the 2001 Stockholm Convention on the prohibition of persistent organic pollutants.

## Allied Chemical

THIRTEEN YEARS AFTER the discovery that Allied Chemical, one of Virginia's major employers, had knowingly discharged the pesticide kepone into the James River, the waterway was fully reopened to fishing.

From 1966 to 1973, Allied Chemical produced kepone at a small plant converted from a gas station in Hopewell, Virginia. After 1973, the plant was operated by two former Allied employees under the name Life Science Products Company. Its sole customer was Allied; its sole product was kepone. In 1975, Virginia closed the plant after workers developed the "kepone shakes," a characteristic tremor caused by overexposure to the chemical. Overexposure can also cause liver damage and temporary sterility. Kepone, a grayish white powder used in ant traps and to kill potato and banana plants, was banned in the United States that year.

The state also discovered that the factory had illegally disposed of large quantities of waste containing kepone. Life Science Products discharged kepone to the local sewage system, which was not equipped to handle it; Allied Chemical discharged kepone directly to the James River. Because kepone accumulates in organic tissues, Governor Mills E. Godwin banned all fishing on a 100-mile stretch of the river.

As the Virginia fishing industry staggered under bad publicity, Godwin and chemical industry lobbyists asked the U.S. Environmental Protection Agency (EPA) to raise the permissible level of kepone in fish, arguing that studies showing links to cancer were flawed. In late January 1977, U.S. District Judge Robert R. Merhige levied a record \$13.2 million fine against Allied Chemical, which pleaded no contest to 940 counts of illegal dumping. By

February 1, he had agreed to reduce the fine to \$5 million if Allied Chemical created an \$8 million environmental fund for Virginia. Merhige declared that the company's managers were "good boys in my book." The fund would be administered by a board of local philanthropists.

Although Merhige commented, "I cannot believe that the board of Allied sat somewhere in New Jersey and said, 'Let's go pollute,'" the Securities and Exchange Commission (SEC) disagreed. In March 1977, the SEC charged Allied Chemical with neglecting to inform its investors that it was knowingly polluting the environment, thereby distorting the firm's financial risks. The company and the SEC immediately signed a consent agreement in which Allied promised not to do it again. That October, the state of Virginia levied its own \$5.25 million fine for environmental clean-up. By April 1978, the company had settled personal injury suits with 30 male workers, 8 wives, and 12 infants who were exposed to kepone.

Allied reappeared in the news in 1982, when it shattered the mutual stock-buying death grip of Bendix and Martin Marietta by buying both, then selling Martin Marietta back to itself. After multiple acquisitions and divestments, the company merged with Honeywell.

## Allied Irish Banks

ALLIED IRISH BANKS (AIB) is the Republic of Ireland's largest banking and financial services organization. The company was formed in 1966

through an alliance of three banks dating from the 19th century: The Provincial Bank, The Royal Bank, and The Munster and Leinster banks. They are now a global organization operating predominantly as a retail and commercial bank with representation in Europe, the Pacific Rim, and the United States.

Worldwide, the AIB Group has 800 offices, 25,000 employees, and approximately 40,000 shareholders. In terms of capital it is ranked 164th out of the world's top 1,000 banks having assets of about \$40 billion. They have strong franchises in the Republic of Ireland, Northern Ireland, Great Britain and Poland and are also a key investor (22.5 percent stake) in the large U.S. regional bank M & T Bank Corp, which has been one of the most successful regional American banks.

#### FRAUD SUSPICION

At the beginning of 2002, AIB suspected fraud at its U.S. subsidiary, Allfirst Financial Inc., a revelation that fueled jitters about the reliability of corporate accounting. AIB's history with Allfirst began in 1983 when it bought a stake in First Maryland Bancorp. In July 1997, AIB purchased Deposit Corporation which was merged with First Maryland Bancorp to form Allfirst in 1999.

Allfirst surprised the business community on February 6, 2002, declaring that it lost millions at the hands of John Rusnak who covered up losses by doctoring computer and other internal bank records over a five-year period, mostly by trading Japanese yen, without being detected. Shares of AIB fell in the New York, London, and Dublin stock exchanges. Immediately after, AIB announced that it had enlisted the aid of the U.S. Federal Bureau of Investigation to find the trader it suspected of being responsible for the fraud. The debacle resulted in extensive changes in Allfirst's executive suite, the firing of seven employees and the sale of the Baltimore bank to Buffalo-based M&T Bank Corp.

The company suspended nearly all foreign exchange trading and, in 2003, suspended five executives at its treasury operations pending the completion of the investigation. Rusnak pleaded guilty to fraud charges in connection with a scheme to hide nearly \$700 million in losses at the bank. Prosecutors said Rusnak fabricated trades to cover losses and maintain his salary and bonuses. He was charged with fraud and false entry to bank records

after the investigation showed that he had been entering fictitious information into the bank's computerized record system to conceal his trading losses and generate false "paper" profits.

Allfirst's parent company agreed to sell the U.S. subsidiary in 2002 to M&T Bank in a deal valued at about \$3 billion. Later, Allied sued Citibank and Bank of America seeking to recover \$500 million in compensatory damages; the share of losses is attributed to the bank's alleged wrongdoing. A lawsuit, filed in U.S. district court in the Southern District of New York suspected that employees of Bank of America and Citibank "joined Rusnak's scheme" because they "agreed to operate the accounts in ways that systematically concealed the actual risks and results of Rusnak's trading from Allfirst." On September 7, 2000, Rusnak proposed that Bank of America send daily trade confirmations to Allfirst in a format he created. Eight days later, he made the same request to Citibank. Rusnak's recap format omitted essential elements such as profit and loss information, the price of his open position in each currency, the risk in the position or its current value. The banks also agreed not to confirm each Rusnak trade, in violation of standard brokerage and industry practice.

## American Civil War

PEOPLE PROFITED, some unduly, from the Civil War as from all wars and other times of rapid expenditure of government funds. A common perception is that the corruption and taking of excess profits (profiteering) came about in part because the secretary of war, Simon Cameron, was a conniver and a hack whose sloppy practices allowed profi-

teers to foist on the government defective weapons, uniforms, and other equipment in violation of President Abraham Lincoln's order that all contracts be sent out for competitive bids.

Actually, it was somewhat more nuanced than that. There is little evidence about procurement and profiteering in the South, but profiteering presumably occurred there as it did in the North, especially during the war's early stages. The initial phase of war is chaotic, and until the system becomes ordered there will be those who take advantage. The system was designed for a much smaller force, a more leisurely pace, a shorter war. The initial procurement effort was haphazard, disrupting the civilian economy in the haste to field armies.

The federal expectation of the war need was 250,000 Union troops for maybe 90 days. The army reached 1.7 million before the war ended four years later. The new kind of war started while experts still debated whether to continue privateering and the sharing of prizes taken at sea. Profiteering occurred in every way anyone could imagine to make money off new technology: steamships, railroads, machine tools, and more complex weapons. Patent royalties, high salaries for executives, stock speculation and manipulation—these were new avenues as well. Shoddy millionaires arose, but before profiteering became outrageous, the procurement service federalized, organized, and streamlined.

#### SHODDY UNIFORMS

Initially, the states bought uniforms. New York contracted with Brooks Brothers in April 1861 for 12,000 uniforms. The company produced 5,000 uniforms in a week and the rest shortly thereafter. The contract was improperly let, with only 24 hours' bid notice, with insider information and a gift to the wife of the state treasurer, who signed the contract. The price was \$20.00 per garment, but later military uniforms would be contracted at \$18.00.

The clothier used lighter weight and, in some cases, rotting cloth. These shoddy uniforms had the look of better quality army-specified wool. Poorly cut and ill-fitting garments sometimes lacked buttons or buttonholes. Brooks Brothers claimed that the damaged goods were only 500 of 36,000 uniforms it made. New York State said it was a majority. Brooks Brothers replaced 2,350 uniforms, a value of \$45,000. The episode was embarrassing to

the state and the clothier because it happened in the middle of the media capital, New York City. It gave a new label to the shoddy aristocracy, the “shoddy-ocracy,” whose homes had shoddy pianos “all case and no music,” shoddy carpets “brilliant colors and little wool,” and so on. Philadelphia, Pennsylvania, had a similar scandal full of cronyism, fraud, and inferior product.

### RAILROAD PROFITEERING

The first controversy came in getting troops to protect the capital. Secretary of War Cameron’s family owned the Northern Central, one of only two connections from the north. Cameron had the duty of deciding how many troops traveled on his family’s line and at what price. There was an unavoidable conflict of interest. In the western states, the railroads had colluded three years prior to the war; troops would ride at first class rates only, and they would have only 80 pounds of baggage each.

The Pennsylvania governor noticed that passenger rates for Pennsylvania volunteers varied from two-and-a-fourth to three cents per passenger mile. He convened a meeting of 21 railroads and established a rate of 2 cents per passenger mile. In return, the railroads got local rates for freight instead of the cheaper through-rates.

Cameron’s assistant for railroad matters, Thomas A. Scott, was on leave from the Pennsylvania Railroad due to a conflict of interest because he was working in government on matters affecting his company, the same as Cameron and the Northern Central. When the Baltimore & Ohio (B&O) Railroad, suspected of Confederate sympathies anyway, tried to charge 3.75 cents per mile, Cameron and Scott forced B&O rates down by routing traffic onto their railroads. This act appeared to be diverting business for their own profit, but it did save the taxpayers money, and the B&O still did fine with its traffic increasing from 8 to over 400 cars a day within a year. Even when Scott set the national rate at Pennsylvania’s 2 cents, railroaders made a profit: their rate for passenger cars was 1.33 cents, and for troops carried in freight cars profits were from 50 to 122 percent. The government reduced rates in 1862 and also acquired the power to take over lines for reasons of public safety; in return, it allowed railroads to lessen competition.

Railroad revenues increased 10 percent in the war’s early months, and Cameron’s railroad’s prof-

its were up over 44 percent in the first year. Scott’s Pennsylvania Railroad increased earnings from \$5 million in 1860 to \$17 million in 1865. The B&O grew from \$31.6 million to \$43.1 million. The small Philadelphia, Wilmington, and Baltimore Railroad profit increased from \$236,000 in the last year of peace to \$1,645,000 in the war’s first year. In 1864, American Express, hauler of freight and corpses, paid a 35 percent cash dividend as well as a 50 percent stock dividend.

### SHIPPING

For the North, to blockade and invade the Confederacy required a massive increase in ships. The 4 million tons of maritime shipping available in the summer of 1861 would be insufficient to blockade the South and transport Northern troops. To quickly enlarge the fleet, the navy used commission agents to purchase or lease ships. Commissions typically were 2.5 percent. The chief agent chosen was George D. Morgan, cousin of the governor of New York and brother-in-law of Navy Secretary Gideon Welles. For procuring 89 ships (at a savings of \$900,000 below asking price), Morgan got a commission of \$95,008, more than Lincoln’s salary for four years. The critics asked if Welles might have negotiated a better deal than 2.5 percent, given the volume involved. Morgan left for a European vacation.

Congress investigated exorbitant fees for charters, failure to advertise contracts, and navy contracts let for up to 40 percent above the going rate. Bribery was part of the expense of contracting too, with contractors paying 2.5 percent commissions or higher to naval agents. Those same agents sometimes sold the navy ships they owned themselves, or had agents buy vessels at reduced prices then sold them to the navy for markups of 50 percent or higher. One shipbroker, W. H. Starbuck, had a friend buy two whalers for a total of \$6,500; then he sold them for \$14,550. The partners split the \$8,050 profit, and Starbuck got a commission of 7.5 percent of the deal. The navy did make him refund \$6,166.

The navy initially paid excess rates for shipping, but once it realized that the conflict would be long, the navy began bargaining better, getting price reductions and better ships, even negotiating refitting as part of its deals. More problematic was the condition of the ships. When Cornelius Vanderbilt’s

*Niagara*, almost foundered, investigators found that it had rotten beams, and life preservers for only 20 percent of the passengers. Worse, it was a lake-going vessel overloaded with soldiers and gear, ill-equipped to handle the Atlantic Ocean. The lease rate of \$400 per day was generous; operating costs were about \$100 per day, but the big problem was Vanderbilt's chartering of a lake-going ship in the first place. Use of vessels for war purposes meant insurance rates as high as 33 percent of the ship's value or 10 percent per month.

### FIREARMS AND PROVISIONS

At the war's onset, the government produced its own arms, but the Springfield armory could produce only about 3,000 weapons a month. To arm the million-man force, the armory would need 28 years. So the government began soliciting arms from private contractors at home and abroad. Generally the contracts were prepared in haste both to arm the North and to keep the South from getting arms. The government paid a premium, a significant profit, but as the initial flurry slowed, the government became more adept at negotiating prices down, especially for follow-on orders and large volume contracts.

Arms-making was profitable, in peacetime returning 10 percent; during the war, profits peaked at 42 percent in 1863 but averaged under 30 percent for the other years. The only excess profits came when the large, efficient manufacturers benefited from a price schedule designed to ensure profits to the smaller and less efficient makers. Inventors and manufacturers of technically innovative weapons, such as the breech-loading rifle sometimes demanded and got large royalties or prices well above average. The breech-loader could cost \$35 whereas a standard carbine cost \$20.

Cannon foundries could charge exorbitantly as well: the West Point foundry in Cold Spring, New York, provided about 20 percent of Union cannons. The superintendent and his partner earned \$278,000 and \$95,000 respectively in 1864, and the tax system was such that their taxable incomes were \$13,900 and \$4,600 respectively. The system wasn't set up to capture the excess profits.

Windfall profits came with the fortunes of war. North-South railroads lost money while East-West lines had great profits. Contractors could receive generous profits for taking risks, or they could lose

everything if the war caught them at a bad time. Cotton and textile speculation was highly lucrative because of the expectation that the supply of cotton would fall. Newsprint and newspapers both were profitable, and naval hardware and stores profits resulted in another Congressional investigation. In the case of Smith Brothers and Co., supplier of naval hardware, average annual sales nearly quadrupled during 1861–63 from the prewar 1860 total of \$150,000. A partner in the company did admit that his prices were above the market low. Merchants did have to wait six months to receive payment in discounted certificates, and they had credit problems because banks didn't accept navy vouchers as collateral.

### SPECULATORS AND PLUNDER

In an inflationary environment, speculation was inevitable. Cheating was too, as in the case of the ring that sought to control the telegraph wires so they could invest based on their prior knowledge of the battle of Chancellorsville. Speculation could be in foreign credits or gold, and the latter led to hoarding and large brokerage commissions and heavy telegraph traffic. Even Southerners speculated in Northern gold. And late in the war, rumors of peace tumbled the stock and gold markets.

The illicit trade was primarily in cotton, but Southerners did try to buy arms before the war. Commerce continued throughout the war. Lincoln licensed cotton traders with the South because he preferred to buy it direct rather than through England, which would have increased the price sixfold. His special licenses caused rumors of bribery and corruption.

General Nathaniel P. Banks required that all cotton purchases be made in Northern greenbacks. Although Southerners didn't want the Yankee currency, they used at least some of it to buy war materiel in Europe. Southerners sometimes demanded payment in gold or salt, and even though the salt trade was outlawed in 1862, it continued with the acquiescence of Confederate President Jefferson Davis. Smugglers were mostly in the border states or Texas, but some Rhode Islanders participated as well.

The laws of plunder remained in effect for the navy but not the army, leading to some occasional abuses, such as the capture of Union cotton that was then branded "C.S.A." and sold. Raiders plun-

dered, as did General Neal Dow, who confiscated furnishings and art objects for his home in Maine; an 1880 Supreme Court decision affirmed the right to plunder. Pilferage, theft, bribery, and cheating were also elements of the trade in plundered goods.

Some people made a living by enlisting repeatedly. The maximum enlistment bonus was \$8,000. Bounty jumpers collected the bonus, disappeared, and enlisted again and again. The record was 32 times. Substitute brokering was another money-maker: for a price, agents would provide substitutes who would sometimes jump bounty or prove unfit. There was also fraud in billing for housing of enlistees, fraud that totaled \$700,000 during the war.

## REGULATION AND POSTWAR

Scandals became widely known, leading to the Frauds Act of 1863, also known as the False Claims Act and the Lincoln Law. The whistleblower provision reduced degraded quality but not price gouging, which was difficult to prove. The government also attempted to run its own arsenals and bakeries and other industries to reduce profiteering. Moral suasion and voluntary anti-luxury campaigns, and the progressive income tax helped, as did renegotiation of contracts and other federal efforts.

Some sacrificed rather than profited. Some railroads refused to charge for transporting troops, some ship owners donated their vessels at no or low cost, and some businessmen sold below cost or brokered European deals and bought spies with their own money. Donations came in the millions from such organizations as the Union League Club and the U.S. Sanitary Commissions, but evasion and exploitation got the headlines even as “shoddy” became a historical term by 1865.

The profiteers didn't make fortunes from the war, but some profiteers did go on to marked success after the war, in part from the capital they amassed during the profit-taking years of the war. John D. Rockefeller was a Cleveland commission merchant who invested his wartime profits in an oil-refining business; eventually the Rockefeller investment turned into Standard Oil. Philip D. Armour anticipated that Union victories would end the war. He sold pork short, making millions. He invested his war profits in a Chicago pork packing house. J.P. Morgan sold uniforms and arms during the war. He bought guns from the government, upgraded them, and then sold them back at highly profitable prices.

He also speculated in gold. Others who speculated and won were the half-a-dozen individuals who built the American transcontinental railroad, another example of inflated prices and exorbitant profits: profiteering.

## American Cyanamid

THIS CHEMICAL company's record-setting activities included the nation's largest corporate contribution to a superfund site cleanup, above-average toxic waste releases, and the largest fine for an air permit violation in New York state. This last record earned the company its number 93 spot in Corporate Crime Reporter's Top 100 Corporate Criminals of the 1990s.

Named for a derivative of a toxic chemical used in pesticides, calcium cyanamide, American Cyanamid manufactured dyes, paints, pharmaceuticals, and other chemicals. In 1929, the company bought Lederle Laboratories, which was already operating a manufacturing plant in Bridgewater Township, New Jersey. Much of the 575-acre site, which sits atop New Jersey's second largest aquifer, became contaminated with chromium, lead, mercury, benzene and toluene, as wastes generated by manufacturing were simply dumped on the property. When Cyanamid settled with the U.S. Environmen-

tal Protection Agency (EPA) in 1988, their \$84 million contribution to cleaning the site was the largest ever corporate share of a superfund site cleanup. The site has since been redeveloped as Bridgewater Promenade, a shopping center with major discount retailers.

Cyanamid's handling of wastes remained dubious into the early 1990s, when protesters rallied to prevent the company from sending 5,000 to 9,000 pounds of mercury wastes to a recycling plant in South Africa with a record of toxic leaks. The South African government responded by barring foreign toxic wastes from entering the country. Cyanamid already had a poor reputation there due to its firing, over pension disputes, of 200 workers at a South African plant. George J. Sella, then chief executive officer of Cyanamid, defended past mercury shipments to shareholders in April 1990, disputing widespread mercury poisoning in the Natal region around the recycling plant: "I am absolutely satisfied that there is no contamination possible from the activities that we are involved in."

#### RECORD FINES

In 1991, the *New York Times* noted that American Cyanamid's toxic releases per \$1,000 in revenues remained quadruple that of other chemical manufacturers. As of late 2003, the Bridgewater facility was listed by the EPA as a High Priority Violator under the Clean Air Act, with the state of New Jersey responsible for monitoring the facility's plans to improve its performance. A second facility, listed in the West Windsor Township of New Jersey, had been in violation of its Clean Water Act permit continuously since at least July 2001.

Cyanamid's \$250,000 air permit violation, a record in New York state, was earned not by excess emissions, but by building an un-permitted power plant. The company had knowingly begun construction of a \$22.5 million cogeneration facility at its Pearl River labs without obtaining required air emission permits. Cyanamid pled guilty to a single misdemeanor count.

These record-setting activities were by no means the end of Cyanamid's brushes with the law. In 1997, professors Robert Allen and Paul Seligman of the University of Colorado successfully sued Cyanamid for stealing their formula for prenatal vitamins that offered better iron absorption. Asked to study improvements to Cyanamid's Materna vi-

tamin, Allen and Seligman discovered 11 years later, in 1993, that their work had been patented under the name of a Cyanamid employee. At the time of the suit, Materna's sales were estimated at \$300 million. In September 2003, a federal appeals court upheld the award of damages to the university and its researchers, setting the amount at \$56 million.

In 1994, American Cyanamid was acquired by American Home Products (AHP), owner of A. H. Robins Company of Dalkon Shield notoriety, for \$9.6 billion. Renamed Cyanamid Agricultural Products, the company staked its future on EPA approval of the pesticide chlorofenapyr. Intended to be used to control beet armyworm on cotton, chlorfenapyr was shown in testing to be harmful to bird and fish reproduction, as well as to persist in the environment. In October 1999, the EPA refused to approve the pesticide; AHP immediately announced restructuring of the Cyanamid division. (AHP later returned to the name of one of its subsidiaries, Wyeth.)

Less than a year later, German chemical company BASF outbid rivals Bayer, Dow, and Sumitomo Chemical to purchase Cyanamid from AHP for \$3.8 billion. The company settled in November 2002 for \$75,000 an Equal Employment Opportunity Commission suit brought on behalf of two men whose job offers were withdrawn after they tested positive for diabetes. As of April 2003, the company was being compelled by court order to surrender records related to an alleged policy of requiring special annual medical testing for employees diagnosed with diabetes.

Potential liabilities for Cyanamid's paint manufacturing operations were, however, the responsibility of New Jersey-based Cytec Industries, Inc., the specialty chemicals manufacturer that had been spun off from American Cyanamid shortly before the 1994 AHP takeover. In March 2000, Santa Clara County, California, filed a suit against American Cyanamid and seven other major paint manufacturers, alleging that these companies had known about the potential health hazards of lead paint since 1904, but continued to market the product into the 1950s.

The suit, joined by 11 other San Francisco Bay Area governments seeking to recover costs of removing lead paint from their buildings, was dismissed on the grounds that it should have been filed within three years of when the paint was applied. A similar suit in Rhode Island ended in a mistrial.

## American Hospital Supply

MERGERS AND MONOPOLIES were the strategic focus of this large hospital supply distributor throughout the early 1980s. A reluctant merger with Baxter Travenol fell apart a decade later while the combined company was fighting product liability lawsuits for leaking silicon breast implants.

In 1982, the last year before the federal government slowed growth in the healthcare industry by introducing fixed-rate Medicare reimbursements, American Hospital Supply (AHS) pursued a strategy of obtaining exclusive contracts with Voluntary Hospitals of America (VHA), the largest group of non-profit hospitals in the United States. A federal

judge ruled that the contracts were an illegal conspiracy and awarded damages to smaller suppliers.

The subsequent slump in the healthcare industry did not prevent AHS from pursuing a more formal vertical merger. In April 1985, AHS announced an intended merger with Hospital Corporation of America. The estimated \$6.6 billion value of the resulting company would have put the merger among the largest in history. While analysts touted the merger as economically sound, HCA president Dr. Thomas Frist dismissed antitrust concerns, assuring *New York Times* that "[T]his will be looked on as a favorable merger, whereas 10 or 15 years ago it would have been a negative from the point of view of size."

Members of VHA disagreed, declaring that they would seek other suppliers. Pharmaceutical and medical device manufacturer Baxter Travenol seized the opportunity to prevent the AHS-HCA merger by making its own offer for AHS. The Baxter deal, initially rejected by AHS' board, promised increased efficiency through a horizontal merger of manufacturer and supplier, similar to the informal arrangement AHS and Baxter had until 1964.

Unlike the old-fashioned stock-for-stock swap of the AHS-VHA deal, the Baxter offer's promise of cash payments for stock excited the interest of arbitrageurs, whose involvement may have allowed Baxter to ease AHS into the deal without resorting to a hostile takeover. Some Baxter shareholders contended that they were coerced into approving the deal, thanks to a clause that promised AHS \$300 million in damages if Baxter had to back out. The suit was settled with minor changes to the deal. Baxter bought AHS for \$3.74 billion, among the largest deals of 1985.

Although Thomas G. Cody, Baxter's vice president of human resources, called the combination a success, Baxter may have acquired some surprises. AHS had been mired in disputes with the Internal Revenue Service over income dating as far back as 1973. Though AHS had won these disputes, Cody notes that some Baxter units continued to question the accuracy of AHS accounting procedures.

A more expensive problem was product liability suits over leaking silicone breast implants, inherited from AHS subsidiary Heyer-Schulte. As litigation against implant manufacturers mounted, investigations suggested that manufacturers had known since the early 1970s that implants could deteriorate, leak, and increase breast cancer risk. Among

the evidence was a 1976 "Dear Doctor" letter from Heyer-Schulte warning of potential implant ruptures. Baxter's 1996 annual report noted that the company faced 6,855 lawsuits and 1,776 pending claims, plus additional class action suits. The number had increased since 1994, when Baxter contributed \$556 million to a fund for implant compensation.

In November 1995, Baxter announced that the AHS merger had failed to produce the expected synergies. Most of the former AHS businesses were spun off in September 1996 as the public company Allegiance Healthcare. Potential implant liabilities remained with Baxter, which had won 24 implant suits by early 1997. Allegiance was acquired in 1999 by CardinalHealth, a horizontal combination of medical device and pharmaceutical distribution businesses.

## American Motors

AMERICAN MOTORS Corporation (AMC), the auto manufacturer with a reputation for appealing to squares, became hip in the early 1980s with what may have been the most dangerous vehicle on the market. By the time the Jeep CJ line was discontinued in January 1986, more than 570 lawsuits worth upward of \$1 billion had been filed. Most cited the

vehicle's tendency to roll over during routine driving conditions.

The Jeep was developed in 1940 to meet the U.S. Army's need for an off-road reconnaissance vehicle. The winning bidder, Willys-Overland, designed a 4-foot-high, 11-foot-long four-wheel-drive vehicle that quickly became beloved by soldiers. In the 1950s, while working on an improved military Jeep, Willys-Overland marketed a civilian version. Upon acquiring the Jeep business in 1970, AMC separated the military and civilian divisions.

The civilian Jeep market took off in 1982, just as the Army was switching from Jeeps to Hum-Vees, said to be better for launching weapons. A year earlier, the Insurance Institute for Highway Safety had declared the Jeep CJ5 "the most dangerous thing on four wheels," citing a fatality rate higher than that of motorcycles. The Insurance Institute's road tests found three out of four CJ5s would flip when rounding an ordinary 90-degree corner at 22 miles per hour. AMC blamed the auto's poor safety record on driver error.

While the National Highway Transportation Safety Board (NHTSB) denied any need to investigate Jeeps, the Federal Trade Commission (FTC) required that a warning sticker be attached to all Jeep CJ5, CJ6, and CJ7 models, starting in early 1982. The label informed drivers that Jeeps, with their narrow wheelbase and high profile, do not handle like passenger cars.

A 1983 prospectus for AMC predicted lawsuits totaling \$2.5 billion for rollover-related injuries. The next year would bring the highest verdict to date against AMC: \$3.8 million in punitive damages for the 1980 death of 18-year-old Carrie Dustman in a rollover. However, injury claims were more typically settled out of court in confidential agreements, leading later litigants to complain that they would never have driven a Jeep if its dangers were known.

Consumer groups clamored for AMC to halt production and recall existing Jeeps. Faced with sales that dropped 50 percent from 1984 to 1985 and losses near \$29 million, AMC said that safety issues and litigation were not behind its December 1985 decision to stop making the vehicles. The Jeep would be replaced by a more comfortable sport utility vehicle (SUV), the Wrangler YL. "This is really to meet the demands of Yuppies," said AMC spokesman Jerry Sloan. "They want a more comfortable vehicle to drive when they have an attaché

case in the front seat and their Burberry coats folded in the back seat." In Los Angeles, where Jeeps had become status symbols comparable to Mercedes and BMWs, Jeep fans rallied unsuccessfully to keep the CJ5 in production.

Jeeps were never recalled, despite consumer advocacy group claims that more than 200 people died in Jeeps in 1989 alone. A NHTSB study in 1990 found that Jeeps were four times more likely than passenger cars to roll in single-vehicle crashes, with a 38 percent rollover rate for Jeeps made before 1981 and a 32 percent rollover rate for those made after 1981. Nonetheless, the NHTSB absolved the vehicle's maker of any responsibility, stating that Jeeps were safe if driven properly. At that time, about 420,000 Jeeps were still on the road, out of more than 600,000 sold between 1972 and 1986.

AMC and its Jeep division became subsidiaries of Chrysler, now DaimlerChrysler, in 1987. Vehicles sold under the Jeep name now include the Wrangler, which most resembles the original Jeep, and the Grand Cherokee, one of the most popular SUVs. In October 2003, the NHTSB released the results of its first round of rollover testing for SUVs. The 2003 Jeep Wrangler scored moderately well with a rollover risk between 20 and 30 percent. The Grand Cherokee posted a rollover risk between 30 and 40 percent.

Another Jeep model, the no-longer-produced Wagoneer, became a litigation target for multiple design defects. In 1989, AMC agreed to a confidential settlement of \$18 million for negligence after a Long Island boy died when his neck became caught in the power window of a 1986 Grand Wagoneer. In January 2003, a suit was filed by the families of three young women killed when their 1983 Wagoneer survived a collision only to burst into flames due to an alleged defect in the fuel system.

## American Revolution

IN APRIL 1775, the first shots were fired at Lexington and Concord, Massachusetts, plunging the American colonies into the Revolutionary War. Just more than a year later, in July 1776, the Continental Congress endorsed the Declaration of Independence, providing legitimacy for the fight for independence from England, then the world's greatest power. When the young nation entered the war, it had only a weak central government; there were no efficient governmental organizations to take charge of procurement for the American troops. The overall result of the lack of organization was chaos, waste, inefficiency, and corruption.

Profiteers were quick to take advantage of the government's shortcomings and to use the emergency situation to their own advantage. It was not uncommon for American troops to go without food, clothing, or blankets while local merchants, profiteers, and speculators grew rich and powerful. Scholars who study the Revolutionary period have estimated that the number of profiteers might have been as high as 90,000 compared to the 100,000 or so who composed the military might of the various armies. Profiteering methods included price-gouging, speculation, plunder, theft, fraud, privateering, ransom, hoarding, and trading with the enemy.

The Continental Congress understood from the beginning that Americans would expect to make money from the Revolutionary War. In 1776, Congress established the Secret Committee of Trade, which stated that the government would be "willing to allow what might be a reasonable compensation without being willing to submit to extortion." Congressional inexperience led to several serious mistakes, such as duplication of services. Duplication meant that different governmental agencies often competed for the same goods, raising prices even

*An American supply train at Valley Forge, Pennsylvania, was a typical opportunity for war profiteers.*

higher. The government often found itself in a no-win situation because it was forced to pay inflated prices to obtain necessities for the troops. Once the inflated price was established, merchants were unwilling to accept a lower price for the item, and the cycle continued. Profiteering was not limited to the private sector but also occurred within the American and British militaries and was common in government.

#### MILITARY PROFITEERING

When Congress offered George Washington a salary of \$500 per year, he refused to accept it and received no compensation other than his expenses. He believed that all patriots should be likewise willing to sacrifice for independence, called profiteers “murderers of our cause,” and was often appalled at what he described as the “insatiable thirst for riches which seems to have got the better of every other consideration.” Washington saw all speculators and profiteers as threats to the war effort and to America’s future as a country, but he was partic-

ularly critical of military officers who engaged in profiteering. Washington wrote that they were “lost to every sense of honor and virtue.”

Unlike the British and Hessian mercenaries, the American army consisted of volunteers who worked for little or no pay. Congress had decided in 1775 not to pay enlistment bonuses, but changed this in 1776. Four years later, troops were receiving \$150 for five months service. To increase their income, some soldiers deserted from one regiment to sign up with another, thus gaining an additional bonus. On learning of this practice, Washington established a punishment of 39 lashes, even greater than the 30 lashes that captured deserters received.

Washington allowed American troops to seize the property of captured British soldiers and divide it among the officers and men involved in the capture. He was determined, however, to stop what he called “unlawful plundering,” which he defined as seizing property that did not belong to the enemy troops. On one occasion, Washington ordered the death penalty for a soldier convicted of plundering. To reduce the plundering of locals, Washington restricted off-duty soldiers to their quarters and instituted roll calls. Both Washington and Congress approved of one method of privateering: the seizure of British ships docked in American ports. Records show that at least 800 British ships were seized; the American navy was responsible for the capture of 200 ships, and privateers seized the others.

Profiteering within the military covered many activities. It was not uncommon for supplies to be lost or stolen while being transported. Unpaid and discouraged troops who were being asked to fight with little or no food and inadequate clothing and shelter sometimes mutinied and stole from one another. To take advantage of the plight of American soldiers, the British promised generous compensation to Americans who joined their military. At times, the American soldiers deserted to take advantage of what the British offered, and then returned to their own armies well fed, well shod, and well equipped. American soldiers were also known to sell their services for the highest wages. In 1778, a newspaper in Wethersfield, Connecticut, openly advertised for “All gentlemen volunteers who are desirous of making their fortunes in eight weeks.”

Washington was determined that profiteers within the military would be severely punished. Records show that at least 30 officers were prose-

cuted for charges that included “writing fraudulent drafts on the commissary account,” defrauding troops of pay, overdrawing provisions, receiving fraudulent commissions, defrauding troops of blanket money, defrauding their own men, converting public property to private use, withholding pay from soldiers, misappropriating rum and soap, selling discharge papers, embezzling government funds and property, fraud, selling hospital supplies, forgery, and various other charges. Punishment for military profiteering included being forced to resign, making restitution, publishing details about crimes, and various criminal charges.

### GOVERNMENTAL PROFITEERING

Profiteers could also be found at the highest levels of government. So many government officials were suspected of profiting from secret deals with private contractors that Congress launched an investigation. Congressional investigators found that government profiteers frequently engaged in nepotism, favoritism, and other forms of corruption. For example, Samuel Chase attempted to establish a monopoly on flour, using information and contacts to whom he had access as a member of Congress. As a result of such practices, Chase’s home state of Maryland, and later Virginia, prohibited merchants from serving as their Congressional representatives. A number of procurement officers were believed to have used government purchasing as a cover for buying items that were then channeled into their own businesses where they were sold to supplement personal fortunes. These government profiteers were so unprincipled that they even used government ships and wagons to transport the merchandise to their own shops and warehouses.

Robert Morris, the chair of the Congressional committee responsible for finances and government procurement, was found to be a master profiteer. Even after the war, Morris continued his profiteering as the superintendent of finance. From this position of authority, Morris made sure that his exporting and importing business flourished. He handled government transactions through a bank he owned in Paris, France, and awarded government contracts to himself and his business partners. Whenever his business associates presented claims to the federal government, Morris paid them while denying valid claims from those outside his own circle. It is ironic that, in 1782, Morris was

given the responsibility for ferreting out “fraud, negligence, or waste on public property.”

Sometimes military profiteering was unintentional, as in the case of Nathanael Greene, who served as quartermaster general of the army. Greene was accused of profiteering because he was often forced to pay inflationary prices for goods that the American army needed. When necessary, Greene and a contractor signed a promissory note to pay for various products. Unfortunately, after the Revolution, the contractor filed for bankruptcy. Greene accepted responsibility for the loans and continued to pay on them until his death in 1786.

### PRIVATE SECTOR PROFITEERING

The most common form of private-sector profiteering was price gouging, which forced both the military and civilians to pay exorbitant fees for necessities and created enormous profits for merchants. Another method of profiteering was the creation of monopolies to corner specific products, and raise prices on those items ever higher than inflation demanded. Some manufacturers engaged in profiteering through cutting production costs and producing inferior goods unable to withstand military life. Inferior weapons, for instance, could cost a soldier his life.

The Revolutionary War also provided fertile ground for the speculators who bought shares in the ventures of profiteers. Prices on securities ranged from one-half to one-tenth of the face value. These shares were sometimes used as collateral by merchants, military officers, and even by government officials. It was estimated that by 1790, most existing securities belonged to speculators, with only a small amount remaining in the hands of pre-war owners. Harvard College, for instance, had amassed a total of \$102,923 in securities during the Revolutionary War, making the institution one of the largest security holders after the war. Harvard’s securities had been received from more than 80 sources. Speculators also made huge profits by trading paper money. In Boston, Massachusetts, for example, one so-called hard dollar could be traded for 75 paper dollars. Around the country, jobbers set up businesses to handle money exchanges.

Much Revolutionary-era profiteering arose from a scarcity of goods, because legal trade was restricted by the Non-Importation Agreements. Trade with the “enemy” was often quite open because a

number of the colonists maintained their allegiance to the British Crown. John Adams, the motivating force behind independence, estimated that only about one-third of the population was “vigorously” dedicated to the American cause.

Because England was so far away, merchants in the colonies prior to the Revolution had been somewhat free to establish their own prices and set their own rules. During the war, merchants resented government officials’ interference in their efforts to make money from the war. Disregarding the Non-Importation Agreements, many merchants continued to do business with England.

### BRITISH PROFITEERING

Like the Hessians, members of the British Army were often paid mercenaries who were willing to profit from the war in various ways. For example, a British lieutenant colonel who paid 4,500 pounds for his commission could become a paymaster and set up fraudulent pay systems that netted him thousands of pounds. As a sideline, the paymaster could purchase luxuries and sell them to regular soldiers at inflated prices. The British military also devised a way to charge the government for high-priced goods while purchasing low-quality goods and pocketing the difference. It was also common for British officers to draw rations for fictitious families, providing themselves with increased personal income. Hessian troops were notorious for plundering. They stole food, livestock, and property and often burned fences, trees, furniture, and buildings for firewood.

### THE STATES

When the Revolutionary War began in 1775, each colony had a separate government, and each was responsible to the British crown in some way. Once independence was declared, 13 separate governments operated in conjunction with a loose federal government. To deal with the emergency brought about by the war, individual states regulated essential or scarce items. Several states also published paper money and declared it legal tender, creating even greater economic problems. States made an effort to prohibit manipulation of monetary standards, but were not always successful.

Profiteering was such a problem that most states passed their own anti-profiteering laws. To

strengthen their positions, states sometimes joined to stop profiteering. For instance, in 1776, the New England states established price and wage controls. Violators were issued heavy fines, with 50 percent of each fine paid to the informer who reported the violation. Merchants all over New England reacted with outrage.

## ancient mercantile crime

THE WELL-KNOWN IMAGE of Diogenes, a philosopher living in the 4th century B.C.E., swinging his lantern as he wanders through the streets of ancient Greece in a vain search for an honest man, vividly conveys the lesson that white-collar crime not only flourished in that culture at that time but, more generally, can be found to varying degrees in every large society throughout the history of humankind.

Diogenes’ own life underlines the point. His father, responsible for minting coins for public use, was convicted of adulterating the coins with base metals. Diogenes then left Sinope, the Greek shipping center on the Black Sea where he had been born, for Athens. He later settled in Corinth, where he preached against the accumulation of riches and luxurious living.

## CRIME IN THE ANCIENT WORLD

Marketplace offenses can be examined to support at least the partial truth of Diogenes' fruitless search for an honest person, a matter that can be examined by looking at efforts to keep impoverished people from starving to death. Rulers throughout history have tried to control monopolization and cheating in transactions involving food so that inadequate food supplies did not decimate or incapacitate the work force and lead the masses to riot in rebellion against the rich and against the political leaders.

In ancient Egypt, near the end of the 7th century B.C.E., poor harvests led to Solon forbidding the export of agricultural products, with the exception of olive oil, a move taken because unscrupulous landowners were sending grain abroad in order to realize greater profits.

Centuries later, in 476 B.C.E. on the island of Teos, a Greek port on the west coast of Asia Minor, a "curse" was decreed by public officials on marketplace malefactors. It was to be read three times a year at public events: "If anyone prevents grains from being imported into the land of Teos by any pretext or device, either by sea or from the mainland, or forces up the price of imported grain, that man shall die, both himself and his family."

The Greek Appolonius is said to have come to the city of Aspendus where he found the people eating weeds in order to stay alive. A mob was on the verge of burning the governor alive, until he disclosed the names of those who were hoarding corn. These merchants were summoned and the governor read to them a message composed by Appolonius, who had vowed to remain silent for five years: "The earth is mother of all, because she is just," Appolonius had written. "But you are unjust and have pretended that she is your mother alone; and if you do not stop I will not permit you to remain on her." The hoarders were said to have been so terrified by these words that they filled the marketplace with corn and the city revived.

In ancient Greece, the law decreed a penalty of death for exporting corn or secreting or hoarding it. Peter Gurney notes that scarcity was sometimes relieved by charitable food contributions by the well-to-do. He maintains that the typical donors were two-faced, looking for both financial profit and popular gratitude. Importantly, he notes, "in antiquity, food was power."

Fiery complaints about marketplace cheaters are a common theme in Judeo-Christian theology. A biblical prophet, Micah of Moresheth, condemned all commercial activity of the time as likely to be sinful: "A merchant shall hardly keep himself from doing wrong and a huckster shall not be freed from sin," Micah wrote. "As a nail sticketh between the joinings of a stone, so doth sin stick close to buying and selling." Talmudic law echoes this position: For commodities deemed necessary to life such as wines, oils, and various types of flour, the rabbis forbade a person to make a profit as a middleman. These essential goods were to be sold directly to the consumer in order to keep the prices low. The Talmud also berated those who tampered with weights and measures and raised prices unjustly. In Proverbs (11:26) in the King James Bible there is the admonition: "He that withholdeth corn, the people will curse him: but blessing shall be upon the head of him that selleth it."

Marketplace offenses tended to be peripheral in Roman life because from the time of Tiberius (11–37 C.E.) to Aurelian (270–75) grain was distributed without cost to upward of 100,000 persons by the Emperor. Later Roman law decreed that *dardanarii*, the term for persons who conspired to increase their profits by delaying deliveries by sea or by employing similar tactics to demand exorbitant prices, were to be punished by a heavy fine, prohibition of future trading, or banishment. Specific laws focused on the magistrates whose duty it was to supervise the importation and local sale of food, with women and slaves encouraged to provide evidence against magistrates if they neglected their tasks.

## CRIME IN EARLY ENGLAND

Religious leaders in England later would repeat the Biblical condemnations of commercial cheating. John Bunyan, the author of *Pilgrim's Progress* (1678), at one time the bestselling book after the Bible, rages against "every man that makes a prey of his advantage upon his neighbor's necessities may well be called an extortioner and judged for one that hath no inheritance in the Kingdom of God." Such persons, Bunyan declared, should "be hissed out of the world."

An interesting sidelight on these views is offered by Thomas Aquinas (1225–74), the leading interpreter of Catholic theology. Aquinas retold the centuries-old observation of Cicero, the Roman or-

ator, about a merchant who was carrying grain to the starving people of a town stricken by famine. The merchant knew that others were following him with more grain. Was he bound to tell the townspeople about the additional grain, or might he remain silent and command a higher price? Cicero had concluded that moral duty demanded disclosure. Aquinas, however, indicated that it would be commendable to tell what the merchant knew, but he maintained that the merchant was not obligated by moral law to predict a future event.

If it failed to occur, he would be robbed of a just price. Today, in the United States, those associated with businesses under the eye of the federal Securities and Exchange Commission are obligated by law to let the public in on relevant information that might influence what investment decisions people make, and to avoid insider trading.

*The distribution of bread, to forestall public revolt, became a foundation of government regulation of trade.*

In England at the time of the invasions of the Saxons and the Danes, the law demanded that anybody who transacted business with a merchant at the market had to provide the authorities with the details of the business and bring a witness to testify to what had transpired. By the time of Athelstan in about 930, all sales involving more than 20 pence had to be conducted publicly. Similar attempts to keep traders honest followed. Aethelred, king of England from 978 to 1016, decreed that purchasers of cattle or sheep must preserve the head and hide for three days before they could sell the carcasses. Under King Canute, a Dane who conquered parts of England in 1013 and married Aethelred's widow, a similar provision to retain proof of a transaction was mandated if more than 4 pence was involved, unless the purchaser had four witnesses to the transaction.

## REGULATED MARKETS

Trading at this time became restricted to specified places and times. This introduction of regulated markets and fairs, the latter generally held but once a year, the former every week, allowed tighter control over commercial ventures. It has been estimated that between 1200 and 1340 thousands of licenses were issued by government authorities to persons seeking to inaugurate markets and reap the gain from the rental of stalls to those with goods to sell.

English common law was defined by William Illingworth, writing in 1800, as "no other than the good old laws and customs handed down to us by our ancestors." Under common law, three specific marketplace offenses were prohibited. They were called forestalling, engrossing, and regrating. All essentially involved tactics that took advantage of a monopoly position to exploit consumers; their offenses are the direct forerunners of current antitrust legislation.

Forestalling referred to the buying up of goods before they reached the market with a view to enhance prices by cornering the market. Engrossing involved wholesale purchasing, that is, the buying of the total quantity of goods available and then demanding whatever price the seller can obtain. Regrating dealt with the purchase of commodities at one market with the intent to sell them at another site where, for whatever reason, they would retail for a higher price.

Parliamentary and law-enforcement attention focused on these offenses particularly when there were food shortages and, in dire instances, famines and starvation. The first known Parliamentary enactment on the subject came in 1266 when the common law was codified by statute and tougher penalties were set in place. One possible sentence for forestalling involved having the offender stand in the pillory (called, more informally, the stretch-neck) with his head and ankles pushed through holes and shackled. Culprits often would be mocked by passersby throwing rubbish at them.

It is worth noting that the 1266 parliament that enacted the initial statutes against forestalling, engrossing, and regrating for the first time (and for centuries, the last time) had women among its members. They were the widows of earls and barons who had been killed in the incessant wars waged in medieval times. Numerous later statutes amended the laws against forestalling, engrossing, and regrating. In 1306, those who violated such laws were reviled by Parliament as “oppressors of the poor” and the “public enemy of the country, a canker, a moth, and a gnawing worm which daily wasteth the commonwealth.” One has to wonder whether the absence of such language in our times regarding some white-collar crimes is a victory for gentility or a loss of moral indignation.

The landmark statute against marketplace offenses was put in place in 1552. The law sought to gather together common-law provisions and to update and make more rational the approach to violations of rules regulating marketplace behavior. Considerable subsequent litigation required the English courts to clarify the reach of the 1552 law. Much of it reflected what we now regard as quaint quibbling characteristic of court proceedings at the time. Among matters that the courts had to adjudicate in earlier times was the question of whether an indictment was satisfactory if it used the Latin term *cumulus* (a heap) rather than specifying precisely what amount of grain was involved in the allegedly illegal transaction. Courts ruled that buying grain with the intent to make starch out of it did not violate the statute because the end product was not the same as the original one, or, as the court put it, the corn “is altered by a trade or science, which is a mystery, and so it is not the same thing that was sold.”

Controversy also arose regarding whether salt did or did not come under the law. At the same

time, English courts were subtly undermining the forestalling laws because of judges’ belief in the benefits of free trade as opposed to marketplace regulation. The eminently powerful Chief Justice Sir Edward Coke (1552–1634), in his treatise on English law, is said by a later historian to have shown “a certain amount of what only can be described as propaganda against control.”

## GROWTH IN TRADE AND POPULATION

The gradual weakening of the laws against forestalling are traced by one scholar to a number of developments: Partly as a result of economic expansion, but still more because of the much larger growth in the provincial population, there was a great development of inland trade in England between 1570 and 1640. The open markets of provincial towns gradually proved incapable of accommodating the expanding demand. By 1640, much of the new trade was transacted outside the “official market,” and was unregulated by local officials. It took place, instead, in the warehouses and, above all, in the inns of provincial towns.

Nonetheless, in periods of severe food shortages, authorities emphasized the necessity to enforce ancient marketplace regulations. For the authorities, dearth was caused not by divine displeasure nor by unfavorable weather but by human greed. In 1597, the Privy Council, on behalf of the king, issued a strong indictment of marketplace manipulation:

There are seene and fownde a number of wycked people in condicions more lyke to wolves or cormorants then to naustrall men, that doe moste covetously seeke to holde up the late great pryce of corn and all other victuells by ingrossing the same into their private hands berganynge beforehand for corne, and in some parts for grayne growing and for butter and cheese before yt be brought to ordynarie marketes for to be brought for the poorer sorte. Against which fowle, corrupt fraude and malyicious greedyness there are both manie good lawes and sondry orders of late yeres given to all Justices.

Under Oliver Cromwell, after King Charles I had been put to death, *habeas corpus* and writs of *certiorari*—legal processes that afforded protection to the

accused—no longer were permitted for offenses that involved buying and selling of a large variety of products because, it was claimed, “the punishment of many abuses we daily prevented and discouraged by such writs.”

A century later, circumstances had changed in dramatic fashion. In 1767, a Parliamentary committee concluded that the laws relating to forestalling were preventing the free trade in grain and other provisions and that this, rather than hoarding and monopolies, was contributing to the excessive price rises. In 1773, Parliament eliminated all statutes that prohibited forestalling, engrossing, and regrating. The common law restrictions remained in place until 1844, though they were rarely enforced.

Adam Smith (1723–1790), one of the leading economists of his and all time, led the charge against the ancient marketing laws. In his monumental treatise, *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), Smith called the regulations “altogether unmerited” and that, left to its own devices, the marketplace will assure that fairness will prevail. High prices, Smith proclaimed, will merely put “the inferior ranks of people upon thrift and good management” and by this means “the dreadful horrors of famine will not ensue.” In a famous line, Smith compared “the popular fear of forestalling” to “suspicion of witchcraft.”

Smith’s views did not impress Jeremy Bentham (1748–1832), another famous political philosopher. For Bentham, the government deservedly ought to seek to regulate social conditions to see that justice prevailed. “I leave it to Adam Smith to talk of invasions of natural liberty,” Bentham wrote. “The interference of government is an event I witness with satisfaction and with much more than I should its forbearance.”

The last throes of the crime of forestalling saw the conviction in 1795 of John Rusby, a middleman. Rusby was indicted for regrating on the basis that he had re-sold oats in the same market on the same day. He was tried before Lord Kenyon who summed up the case in ringing terms, emphasizing the damage done to the poor and starving by such underhand marketplace tactics. Kenyon declared that if Smith were still alive he was certain he would change his views about eliminating the crime of forestalling.

Kenyon told the jury that its verdict would “stem the torrent of such affliction to the poor.”

The jury found Rusby guilty and the judge imposed a stiff fine.

Worse was yet to come. Rusby’s house was torn down by an angered mob that subsequently descended on the market and demanded that prices be lowered. The rioting drove many merchants out of the marketplace, thereby causing a further increase in prices.

## CRIME IN THE AMERICAN COLONIES

The legislative history of the American colonies shows the adoption of laws against forestalling because of ties of the colonists to English law. Most of these laws came into force about the time of the American Revolution, when England was backing away from legal control over marketplace middlemen. It had been proposed (and opposed) during the Continental Congress in 1777 that federal laws be adopted to outlaw forestalling and engrossing. In June 1777, Maryland forbade forestalling if the price involved provided the seller a profit greater than 30 percent. Sir Henry Clinton, governor of New York, issued a proclamation late in 1777 that declared if a person sold goods for a price higher than that stipulated by the authorities, his merchandise would be seized and he could be imprisoned. Connecticut outlawed engrossing in the same year, with a particular focus on salt.

Officials were authorized to seize goods being engrossed and sell them at prices set by colonial officials. Similar kinds of enactments were made in the same year in New Jersey, North Carolina, and Pennsylvania. But, as in England, the ideas of free trade, a self-regulating marketplace, and the importance of middlemen to spare growers extra work carried the day.

## Anderson, Jack (1922– )

JACK ANDERSON IS a Pulitzer Prize-winning investigative reporter, author, and public speaker. A former missionary, Anderson's career as an investigative reporter began in the early 1950s when he teamed with the most famous muckraking journalist of his day, Drew Pearson.

Anderson's most notable encounter with white-collar crime took place during the Watergate era (1972–74). Anderson had reported on several scandals involving President Richard Nixon, which landed Anderson at the top of Nixon's infamous Enemies List. As a result, a plan emerged by the Plumbers (a secret covert-operations unit within the White House) to have Anderson murdered. Gordon Liddy, the Plumbers' chief fanatic, finally backed-off of the plan to assassinate Anderson because it was deemed impractical.

Upon taking office, the Nixon administration dispatched an allegedly Mafia-connected attorney, Murray Chotiner, to see visit Anderson. The lawyer informed Anderson of the administration's wish to have a friendly relationship with him, and that Chotiner had been appointed liaison to Anderson. At Anderson's request, and as a show of "friendliness" to help further Anderson's investigations, Chotiner promptly fetched the Internal Revenue Service (IRS) file on Governor George Wallace of Alabama. It contained information on a Wallace crony who was taking kickbacks on sales on alcohol in state liquor stores, and laundering cash through a law firm in which Wallace was a partner. Anderson made use of the information, but also began writing pieces critical of the Nixon crowd, and the Nixon administration "friendship" was promptly withdrawn.

Anderson soon began uncovering a host of scandals that would come to mark the Nixon administration as one of the most corrupt in Ameri-

can history. It began when Anderson discovered that Nixon was trying to get his presidential pension increased. Anderson also discovered, via secret papers that were leaked to him, that Nixon had ordered a U.S. Navy flotilla to the Bay of Bengal in order to support Pakistan in its war against India. This, despite Nixon's sworn neutrality in the conflict.

Nixon had deceived the American people about U.S. neutrality in the war, as well as a possible confrontation with the Soviet Navy in the Indian Ocean. The White House began investigating Anderson and his possible sources of information (via phone taps, lie detector tests, and in some cases, intimidation). Press attacks against Anderson ensued. Meanwhile, Anderson was awarded the 1972 Pulitzer Prize for his coverage of the India-Pakistan War. Shortly thereafter, Anderson came into possession of memo written by International Telephone and Telegraph (ITT) corporate lobbyist Dita Beard. The memo made clear that ITT was about to donate \$400,000 in support of the upcoming Republican National Convention in San Diego, California, in return for which the Nixon Justice Department would allow ITT to keep two newly purchased companies, Hartford Insurance and Grinnell Corporation. The Senate Judiciary Committee called immediate hearings on the matter. ITT hired a detective firm to investigate Anderson.

Despite the decision not to eliminate Anderson, the Nixon White House used other government agencies to harass Anderson. At the White House's request, the IRS audited Anderson's income taxes for months but found nothing irregular. The Central Intelligence Agency followed Anderson all over Washington in unmarked cars, but Anderson easily detected their presence and wrote about the stalking.

Nixon, for 25 years, had a great dislike and fear of what he regarded as the "eastern liberal establishment press." The animosity between Nixon and the press began during Nixon's initial campaigns for the House of Representatives and the U.S. Senate. His virulent anti-communist campaigns against his opponents, Helen Douglas, whom he dubbed "the Pink Lady" (labeling her a socialist), and Jerry Voorhees (whom Nixon labeled a communist), outraged numerous reporters. So did Nixon's participation in the anti-communist, Senator Joseph McCarthy's House Un-American Activities Committee of the 1950s in which Nixon played a key

role in the convictions of Alger Hiss and Julius and Ethel Rosenberg on charges of spying for the Soviet Union. Anderson and his partner at the time, Pearson, were instrumental in attacking the unconstitutional investigative tactics of McCarthy.

Anderson continued his involvement in investigative reporting throughout a career that spans over half a century. In his eighties in 2003, he was reporting on the Blackout of 2003 during which a cascading power failure knocked out the electrical grid though Canada and the U.S. Northeast.

## Anheuser-Busch

THE INTERNATIONAL brewery's 1997 removal of a Florida distributorship from the family of baseball legend Roger Maris became a \$72.6 million embarrassment. The distributorship, which served the Gainesville-Ocala area, was given to Maris's by August Busch, Jr., as a reward for Maris's role in the St. Louis Cardinals's 1967 World Series victory. Busch then owned both the baseball team and the St. Louis-based brewery.

In the mid-1990s, Anheuser-Busch started consolidating wholesalers into larger regions. The company offered the Maris family \$20 million for Maris Distributing. When the offer was refused, Anheuser-Busch terminated the wholesaler's contract, alleging that the Marises had sold outdated beer and failed to respond to customer complaints. The Marises accused the brewer of engaging in a smear campaign to justify its giving the distributorship to a Busch family friend.

The Marises also argued, unsuccessfully, that a contract provision preventing them from selling to public investors violated antitrust laws. Although

the antitrust charges failed, a Florida jury decided in August 2001 that Busch had lacked adequate grounds to terminate the distributorship. The jury awarded the Marises \$50 million for the value of the business plus \$89.7 million for lost revenues. Judge Buzzy Green voided the larger award, citing Florida statutes against awarding lost revenues, though he added accrued interest to the \$50 million.

Anheuser-Busch's 2002 annual report stated that the company appealed the decision and had not paid the \$72.6 million recorded in October 2001. The Marises also filed a \$1 billion defamation suit against the brewery; this remains unresolved in early 2004. "It sends a warning signal to suppliers to change the way they rank and yank their distributors," Mark H. Rodman, former general counsel to the National Beer Wholesalers Association, told the St. Louis Post-Dispatch after the August 2001 verdict. But, Rodman cautioned, "Very few legal teams can go toe-to-toe against A-B."

## antitrust

IN GENERAL, antitrust refers to the regulation of business practices that significantly reduce or deny competition and/or severely limit consumer access to goods or services at reasonable and competitive prices. In this respect, the purpose of antitrust laws is to criminalize and breakup monopolies, protect against unfair competition, and control mergers. The development of antitrust legislation began

shortly after the Civil War as political legislators became increasingly skeptical of the growing power and size of business organizations.

From 1887 to 1904, several mergers took place that effectively established dominant monopolies including Standard Oil in the petroleum industry, U.S. Steel, American Tobacco, Kodak in the camera and film industry, and DuPont in the explosives industry. The development of these cartels posed serious concerns about their potential to control the U.S. economy. The threat of monopolistic practices meant a single firm in a market could effectively reduce output, control market prices, and earn higher profits in the absence of competition. Furthermore, the existence of monopolies could make entrance into the market by new competitors extremely difficult. Legislators were also worried about the welfare of small businesses under such conditions. In particular, there were concerns that small businesses would not be able to remain competitive if they encountered predatory or discriminatory low prices set by large companies.

## ANTITRUST ACTS

To address concerns of the growing number of monopolies, the federal government developed the Sherman Antitrust Act in 1890. This act became the primary legislation to address concerns of unfair competition and market conditions. The Sherman Act is comprised of two primary sections. Section 1 addresses any actions intended to produce an unreasonable restraint of trade or commerce. Specifically, this section prohibits contracts, combinations, and conspiracies that attempt to restrain trade efforts.

Section 2 of the Sherman Act deals with the issue of monopolies. It states that any person or persons who attempt or conspire to monopolize an industry is in violation of the act. Other provisions within the Sherman Act pertain to criminal sanctions. More specifically, the act allows the federal government to seek criminal and civil remedies against companies and subjects violators to potential fines or imprisonment. Private citizens injured by monopolistic practices can also seek damages.

Shortly after the development of the Sherman Act, Congress passed other legislation to deal with unfair market practices. It should be noted that about 10 of the first 15 antitrust cases were brought against labor unions and organizers, accusing them

of using labor strikes and boycotts as restraints of trade.

In 1914, the Clayton Act and the Federal Trade Commission Act were passed. The Clayton Act focuses primarily on the development of mergers. This act suggests that mergers necessarily increase concentration and encourage coordinated activity among a few companies. The existence of such mergers means that a relatively small number of companies can control prices, market conditions, and effectively reduce competition.

In 1968, the Clayton Act served as the basis for the development of the Merger Guidelines drafted by the Department of Justice's Antitrust Division. The guidelines outline the conditions under which mergers would likely be challenged and considered a violation. The Federal Trade Commission Act was designed to punish any unfair methods of competition. In particular, this act made it unlawful to restrict competition using unfair trade practices.

Enforcement of antitrust laws were relatively weak. From 1890 to 1899, only 15 cases were filed by the U.S. Department of Justice under the Sherman Act. Loopholes and ambiguous language also rendered the Sherman Act ineffective in terms of dramatically limiting the existence of monopolistic practices. In an 1895 decision, the Supreme Court ruled that manufacturing companies, such as American Sugar Refining Company, could not violate provisions stipulated by the Sherman Act since manufacturing was not interstate commerce.

Perhaps the most aggressive enforcement of the Sherman Act came after World War II. Between 1940 and 1959, there were a total of 703 cases filed by the Justice Department compared to only 203 cases from 1890 through 1939. Also during this time, the number of private suits under the Sherman Act began to increase. During the 1950s and 1960s, several Supreme Court decisions prohibited mergers between firms if at least one of the companies had a modest market share. The rationale behind such decisions was to ensure competition and preserve market structures within the American business community.

Despite the more assertive efforts, by the early 1980s, the Ronald Reagan administration relaxed government involvement in antitrust matters. Court decisions during this time rarely prohibited mergers or price-fixing practices. Even in cases where mergers eliminated potential competitors,

the courts were reluctant to aggressively enforce antitrust laws. This *laissez-faire* (hands off) approach meant that companies were allowed to establish mergers and monopolies without penalty. There was also reluctance to award damages in private suits. Also, an influential economic perspective emerged that suggested mergers and monopolies were actually pro-competitive rather than anti-competitive. Economists from the Chicago School maintained that price-fixing or other antitrust practices cannot be readily accomplished because market conditions do not allow them, and that it was fairly easy for new companies to enter an industry.

Recent decisions have tended to reflect this viewpoint as courts have ruled the presence of mergers, oligopolies, or even monopolies does not necessarily indicate unfair market conditions. In one of the more celebrated exceptions to lenient enforcement of antitrust laws, in 1998 the United States filed charges against the computer software giant, Microsoft, for violations of the Sherman Antitrust Act. A 2001 court decision found Microsoft guilty of violating Sections 2 of the Sherman Act. In particular, the court found that company unlawfully had power in the market for licensing Intel-compatible PC operating systems.

## Arab nations

DEVELOPING countries, such as those of the Arab world, are particularly vulnerable to both organized and business crime because of political,

legal, and economic systems that are still in the process of evolving. Just as in the rest of the world, most economic crimes in the Arab world stem from corrupt government officials, an avaricious business community, and individuals and groups who are willing to exploit others to achieve their own goals.

The United Nations Office on Drugs and Crimes has observed that corrupt governmental authorities in many developing countries regularly force residents to pay “surcharges” to obtain drivers’ licenses, building permits, or other routine activities. Representatives of the World Bank have stated that corruption is the single greatest obstacle to economic and social development in the world today. Widespread corruption tends to sap the energies of any country, and the resulting anger and cynicism affect the level of trust that is necessary for political and economic systems to function effectively. Corruption also drains the economic and human resources that are vital to developing nations.

Developing countries generally lag behind on technological advances, and computer crime has presented a new and complex problem for Arab countries. Many Arab nations have set up special e-crime units to deal with incidences of cyber crime. While computer hacking in the Middle East amounts to only 1 percent of the world’s hacking totals, incidents of cyber crime are on the rise. For example, in 2002, the United Arab Emirates saw a 300 percent rise in computer hacking in only six months.

In a major crime spree, which UAE traced to Indonesia, hackers managed to steal between \$2 and \$3 billion in an ATM (auto-teller) scam. This incident helped to alert Arab countries to their vulnerabilities. Experts on cyber crime have determined that Iran, Kuwait, United Arab Emirates, Saudi Arabia, and Egypt are among the top 10 nations of the world that are the most vulnerable to attack by computer hackers.

#### GOVERNMENT AND BUSINESS

In addition to business and organized crime, the Arab world has had its share of political scandals. In Israel, for example, the police interrogated Prime Minister Ariel Sharon in November 2003 about a \$1.5 million loan from a South African businessman. A separate scandal involved Sharon’s son,

Gilad, who exercised his right to remain silent when questioned about a suspiciously illegal development deal in Greece. In November 2003, the Muslim Brotherhood charged the administration of President Hosni Mubarak of Egypt with providing cover for widespread corruption at all levels of government. For over six decades, governmental authorities in Lebanon have been unable to stop widespread corruption. In 2003, several major scandals occurred. Lebanese officials launched an investigation concerning questionable activities at the Al-Madina Bank. Central Bank Governor Riad Salameh filed charges against unknown individuals who had forged his signature on two documents, one of which approved a merger and another dealing with a \$170 million transfer of funds. Other high-profile scandals involved a prominent businessman who passed a fraudulent check for \$100,000 and shady real estate deals.

Jordan focused international attention in 2003 on the case of financier Ahmad Chalabi who had been appointed to the Iraqi Interim Governing Council even though he had been convicted in Jordan *in absentia* on charges that he stole more than \$500 million during the Petra Bank scandal of the 1980s. Jordanian officials accused Chalabi of engineering fraudulent financial deals that involved Iraq, Iran, Lebanon, and Switzerland. Chalabi's brothers Jawad and Hazem were convicted of accounting fraud in Switzerland in 1989. Jordan announced that it had passed a new law that would allow Chalabi to repay the money he stole in return for an official pardon; however, authorities believed that the United States would prevent Chalabi from being extradited to Jordan.

Business crime is also a major concern to the Saudi authorities. In 2002, the Saudi government announced that it had documented 264 cases of bribery involving 747 individuals.

In the United Arab Emirates (UAE), business crime has centered on embezzlement of funds, fraud, and bribery. In the winter of 2001, a major scandal erupted when 20 UAE government officials were charged with corruption and embezzlement. In response, the minister of justice and Islamic affairs asked the public to demand that government corruption, that had long been a part of life in the United Arab Emirates, be brought to a halt.

In addition to economic crimes, the Arab world has proved fertile ground for organized crime. Crimes practiced by these groups include: terror-

ism, money-laundering, drug trafficking, arms trafficking, human trafficking, explosives, business fraud, insurance fraud, government fraud, computer crimes, extortion, bribery, murder, theft of art and cultural objects, and kidnapping. In fact, kidnapping has become so common in Arab countries that a number of insurance companies, including Lloyds of London and Liberty Mutual, regularly issue kidnapping insurance that pays up to \$40 million if a policyholder is kidnapped or becomes a victim of extortion.

Traditionally, organized crime is driven in large part by a desire for financial gain and is characterized by violence and intimidation. Organized crime families tend to be made up of individuals who share common goals who bond together under strict rules of loyalty and compliance. Disloyalty to the group may be punishable by death. In the Arab world, the basic human greed common to participants in organized families is both enhanced and complicated by radical political beliefs and religious fundamentalism. Organized crime groups that start out with political or religious goals may become so focused on furthering economic goals that their original purpose becomes secondary. In some Arab countries, the state becomes the instrument of international terrorism.

Beginning in the mid-1980s, leaders of some Arab states sponsored the targeting of American military and diplomatic targets throughout the Middle East. In other Arab states, the state engaged in Mafia-like tactics of terrorizing the locals through violence, threats, extortion, and bribery. In Saddam Hussein's Iraq, for example, he and his relatives were joined by an army of state police in their campaign to intimidate the Iraqi people. In many Arab countries, the legal system has proved ineffective in combating organized crime, and this is particularly true when the government is involved in criminal activity.

Despite the U.S. invasion in November 2001, a well-supported organized crime network in Afghanistan continues to be involved with drug trafficking, particularly with opium, and the trafficking of women. An additional enterprise includes the practice of trading emeralds that originate in the Panjshir Valley, that are purchased duty-free in Oubai, and then smuggled into Pakistan, India, and other parts of the world.

Organized crime in Egypt has placed the country in the position of becoming a transit point for

heroin and opium that is smuggled out of Asia into Europe, Africa, and the United States. Because of the drugs, money-laundering is a major criminal activity in Egypt. In many Arab countries, organized crime often becomes entangled with religion. In Egypt, for instance, the Muslim Brotherhood has consistently tried to force the Christian Copts to pay a tribute or *gizia*, which they claim is a kind of protective tax.

The Israeli police announced in 2003 that organized crime, including drug smuggling and human trafficking, was on the rise. Government investigations also focused on questionable ties between Israeli and Palestinian businessmen. A number of criminal charges were filed in Palestine in the summer of 2000 arising from the counterfeiting activities of several gangs. Investigations revealed that Israeli and Palestinian manufacturers were heavily involved in counterfeiting compact discs, computer software, name-brand jeans, liquor, packaged foods, and perfume. A car ring was also discovered in which Palestinians stole cars in Israel, stripped them down, and then sold the parts back to Israelis. In 1997 alone, 46,000 cars were stolen from Israel, amounting to one-third of all new cars sold that year.

Insurance fraud also surfaced when Israeli citizens were accused of selling cars to Palestinians who then sold them for inflated prices while the original owners filed insurance claims for stolen cars. Tens of thousands of guns are stolen from Israeli homes each year, and many make their way into the hands of Palestinians or various terrorist groups. In addition to drug trafficking, the manufacture of counterfeit drugs also poses major problems in both Israel and Palestine.

In Saudi Arabia, authorities have become so determined to stamp out the illegal drug trade that they have made drug trafficking a capital offense. The country also has a problem with money-laundering used to cover the tracks of drug dealers and other criminals. Saudi authorities acknowledge that the country has also become a transit center for organized arms smuggling. Because of its vulnerability to organized crime, the Saudis, working with United Nations representatives, have developed legislation aimed at eradicating organized crime. Saudi Arabia took the lead among Arab nations in establishing a multi-level anti-organized crime program that included establishing a nationwide standing committee to research and report on organized

crime, creating a department of public security that specialized in the subject, training the criminal justice system to deal with the problems associated with this type of crime.

The UAE has also taken a leadership role in combating organized crime. Working with representatives from the United Nations, the country sponsored a two-day conference in December 2002 to bring together representatives from other Arab countries to examine the impact of world political, economical, and technological developments and their impact on organized crime in an international context. Because of its status as a financial center, UAE has had to cope with extensive money-laundering. In January 2002, new legislation was passed to deal with the problem. Just as in most other countries of the world today, drugs are also a major source of crime within UAE.

## TRANSNATIONAL CRIME

Organized crime has become an international problem because crime "families" regularly cross their own national borders to wreck havoc on the rest of the world. The problems arising from transnational crimes have become so extensive that the United Nations has developed special programs directed toward eradicating transnational crime. These programs have two major goals: helping individual nations to develop policies and laws to deal with such criminal activity within each country, and fostering international cooperation through enhanced intelligence and sharing of information. Arab countries, often working with the United Nations, are banding together to fight organized crime by treating it as a regional and international issue as well as a domestic problem. Terrorism, arms smuggling, drug trafficking, and money-laundering have surfaced as the predominant transnational crimes.

A September 2003 report issued by the Executive Director of the Algerian branch of Interpol warned that he had established a definite link between terrorist groups and the organized crime activities of the GIA Armed Islamic Group, the GSPC Salafist Group, and al-Qaeda that stretched into parts of Africa, Asia, and the West. These groups used charity groups as fronts to raise money to set up training camps for terrorists and to purchase illegal weapons from other nations.

The International Anti-Counterfeiting Coalition (IACC) has also identified a growing problem

with transnational counterfeiting that costs over \$200 billion a year from lost jobs, taxes, and profits. The counterfeited items, many of which originate in Arab countries, include name-brand clothes and shoes, compact discs, perfume, liquor, and a host of other products. IACC has also identified links between organized counterfeiting rings and various terrorist organizations. In addition to the traditional understanding of terrorism, a new element has been added with the introduction of “narco-terrorism,” which uses drug trafficking to achieve terrorist goals.

Organized crime from Arab countries has taken root in other countries around the world through emigration. For instance, a well-known Iraqi crime group known as the Chaldean Mafia began operating in the United States during the latter half of the 20th century. The group, based largely in Detroit, Michigan, and Chicago, Illinois, has been suspected of drug trafficking, gambling, and the smuggling of illegal immigrants. The Chaldean Mafia, which has around 150,000 members in the United States and over 600,000 in Iraq, is reportedly controlled by Bahaa Kalsho from a Michigan jail cell.

Unlike the Chaldean Mafia, the Arabian Posse originated in the United States in response to anti-Arab attacks in Chicago during the Gulf War in 1991. In Roanoke, Virginia, the Abed Crime Family was accused of attempted contract killing, arson-for-hire, drug dealing, witness intimidation, and extortion. Organized crime rings regularly smuggle drugs into the United States from Arab countries.

For example, an Israeli crime syndicate has become the foremost provider of the drug known as Ecstasy. The United States is not the only nation to have been infiltrated with Arab crime gangs. South Africa, for example, has been overrun with more than 230 Pakistani crime groups that use local South African criminals to smuggle diamonds and other precious jewels, and to engage in illegal drug trafficking.

## arbitrage

A SIMPLE definition of arbitrage comes from Investorwords.com: “Attempting to profit by exploiting price differences of identical or similar financial instruments, on different markets or in different forms.”

Arbitrage is possible because markets are driven by imperfect information. It is therefore possible for the same security to have one value in New York and a slightly different value in London. When dealing with large amounts of securities, a difference of a fraction of a cent can yield substantial profits for the clever arbitrageur.

The classic, almost risk-free form of arbitrage is taking advantage of small differences in the pricing of foreign currencies. Let’s say that one dollar in United States currency is considered equivalent, today, to 0.85 euros. One euro is trading for 260 Hungarian forints. And one Hungarian forint is trading for 0.00475 U.S. dollars. A currency arbi-

*Speculating on the different prices of world currencies at a given point in time in several different locations is one form of arbitrage. Arbitrageurs can yield great profits from small currency fluctuations.*

trageur with \$100 buys 85 euros. She then trades her 85 euros for 22,100 Hungarian forints. Finally, she trades her 22,100 Hungarian forints for \$105. Based on a small mismatch in currency values, she has made a 5 percent profit.

However, our arbitrageur probably will not be able to make the same maneuvers tomorrow, as her own actions are part of the market. As other traders see and respond to her trades, the values of the three currencies will tend to adjust into closer parity. At some point, the small differences in value will become smaller than the costs of the transaction, removing the opportunities for arbitrage.

This basic example points to the value and perils of more complex forms of arbitrage. Arbitrage is valuable to markets because it gradually adjusts mismatches in value, creating a more rational market. At the same time, arbitrage opportunities are few, difficult to identify, rarely greater than their own transaction costs, and tend to eliminate themselves through their own effectiveness. Successful arbitrage in more complex securities markets can be a difficult investment strategy to pursue without illegal insider information.

### THE BOESKY WAY

Ivan Boesky's manual on arbitrage techniques, written before his arrest and conviction for insider trading, touts risk arbitrage as a "sensible investment strategy." Risk arbitrage differs from classic arbitrage in that its currency is not money but securi-

ties. For Boesky and his imitators, opportunities for risk arbitrage were the low-hanging fruit of corporate mergers.

As Boesky explains, in the simplest merger, a stock-for-stock exchange, the acquiring company often bids more for the target than its current stock price. So, for instance, General Electric, now trading at \$28 a share, offers to buy Terra Networks, now trading at \$5.75 a share. In a perfectly even trade, each GE share is worth 4.87 shares of Terra Networks. However, GE wants Terra's shareholders to approve the merger. Therefore GE offers a 1:4 swap, treating Terra shares as if they're worth \$7 each.

This means that today, Terra stock is worth \$5.75, but the day of the merger—if the merger happens—Terra stock will be worth \$7. The arbitrageur sees an opportunity for a profit of \$1.25 a share, the difference between \$5.75 and \$7. His plan is to buy Terra now at \$5.75 and sell it after the merger for \$7. Ordinarily, GE will be pleased to see arbitrageurs buy Terra stock, as the arbitrageurs want the merger to happen and will vote their stock accordingly. (GE will become less pleased if arbitrageurs generate so much activity that Terra stock rises above \$7 and GE has to pay more to acquire the company.)

Boesky adds that an arbitrageur would also usually protect himself from the danger of a fall in GE's stock price by selling short the stock of the acquiring company. In effect, he would borrow and sell shares he doesn't have at today's \$28 price, knowing that if GE's value falls, he can buy its stock

at the new, lower value to cover the stock he sold at the old, higher value. If this hedging is done correctly, it will lock in a reliable profit for the arbitrageur.

Most mergers and acquisitions are not, of course, simple stock-for-stock trades. The Harvard Business Review points out that arbitrageurs were particularly important to the success of the cash tender offers popular in the late 1970s, where arbitrage made shares available that ordinary shareholders might not have tendered. In more complicated deals, it can be difficult for the arbitrageur to find a way to hedge against the risk that the deal will be delayed, that the deal will fail, or that the deal will be consummated at a different, far less advantageous, price. Arbitrageurs can thus be seen as profiting by assuming risks that ordinary shareholders are not willing to accept.

The ordinary shareholders reduce their risk by selling to the arbitrageur at the current price; the arbitrageur runs the risk that the deal will not close at a price above what he paid for the shares. Arbitrage is such an important element in deal-making that it is not uncommon for 40 percent of a company's stock to be held by arbitrageurs while a deal is being negotiated and approved.

#### THE PONZI WAY

A challenge of successful arbitrage is financing the arbitrageur's purchases until he is able to sell at the desired price. In one early example of criminal activities related to arbitrage, the illegal activity was not the arbitrage itself but the financing used to make it possible. In 1920, Charles Ponzi concocted an arbitrage scheme to buy postal coupons in Spain and sell them to the U.S. Postal Service at a higher price. Promising his investors a 50 percent return in 90 days, he inevitably found himself paying earlier investors with capital raised from later investors, rather than from the proceeds of successful arbitrage. His Ponzi scheme defrauded 40,000 people of \$5 million.

A related challenge is finding deals in which the profit to the arbitrageur outweighs the costs of the transaction, including financing, taxes, and trading fees. Boesky optimistically suggested that a 40 percent profit on a deal is both desirable and achievable. His investment partnership did indeed, in the early 1980s, average 44 percent returns, according to a glowing 1984 profile in *Fortune*. After Boesky in-

corporated, his success rate was lower, but his business was able to offload most losses onto his investors. For his ability to know in advance what deals were happening, Boesky credited an extensive research effort. "At any one time he has six Wall Street law firms researching a particular deal," an associate told *Fortune*.

#### THE CRIMINAL ELEMENT

Two years later, Boesky was arrested—and later convicted—for insider trading. His research turned out to include secret deals for confidential information from Wall Street investment bankers such as Dennis Levine of Drexel Burnham Lambert and Martin Siegel of Kidder Peabody. While Boesky's ostensible strategy had been to buy the stock of companies that looked like attractive takeover targets, hoping that a takeover would materialize, Boesky's inside information allowed him to buy stocks of companies whose takeover was a near certainty but had not yet been announced. His risks were thus minimal; in some cases, his inside information probably drove up the costs to the acquiring company.

In the wake of the arrests of Boesky, Levine, and Siegel, the primary risk of risk arbitrage seemed to be not losing money but being arrested for trading on information that the arbitrageur might or might not have realized was illegally gained. One Wall Street investment banker told *Fortune* in 1987 that, with the new paranoia, "Most arbs are not even obtaining information they are legally permitted to have." Another commented: "Have you noticed how much hugging is going on lately on Wall Street? We're checking to see if the other guy is bugged."

The practice of risk arbitrage rebounded in 1994, when GE made its bid for Kemper. However, the new arbitrageurs did not secretly buy stocks in the manner of Boesky. Instead, they worked the phones to see that the deals on which they were betting would be consummated successfully. "I make it my business to make companies behave," explained Guy Wyser-Pratt, one of the survivors of the 1980s arbitrage boom.

Corporate staff, in turn, complained that their phones were swamped with swarming arbitrageurs trying to influence the deal. However, the big insider trading rings were apparently gone; the U.S. Securities and Exchange Commission (SEC) pursued few

or no insider trading cases against arbitrageurs in the 1990s.

Although risk arbitrage has dominated headlines, it is far from the only form of arbitrage. Indeed, there is potential for arbitrage wherever there is a potential for markets to set different values for the same security or for a portion of the same security. Since arbitrage tends to push values in different markets toward convergence, arbitrage opportunities appear and vanish quickly. For instance, successful arbitrage firm Louis & Dreyfus & Cie., whose founder declared "Arbitrage is salutary hygiene," made its move in the mid-1990s to exploit price-setting confusion resulting from deregulation of the U.S. electricity market.

The government also acts to close arbitrage opportunities. For example, in 1994, the U.S. Internal Revenue Service (IRS) cracked down on municipal bond deals in which the debt is so heavily back-loaded that the funds will never be used for improvement projects, a maneuver hidden with bogus insurance so that investors can collect interest from a separate investment rather than from the results of the project. The major principal, explained a Treasury official, is that "a guarantor, bondholder, or any similar party cannot obtain the benefit from borrowing at tax-exempt rates and investing at taxable rates." In 2001, the cities of Bakersfield and Palm Springs, California, were arguing that a new IRS audit into their bonds was unfair, as the bonds had previously been declared tax-exempt and appropriately structured.

Increasingly, arbitrage opportunities involve "making companies behave," with arbitrageurs taking a more active role in corporate decision-making. For instance, fund arbitrage of the late 1990s involved targeting closed-ended funds, whose shares inherently tend to decline in value after purchase. Arbitrageurs would find a fund whose disgusted investors were willing to sell shares to them at a discount, then use the power of their large share to force the fund to become open-ended, allowing them to cash out at a profit.

Enthusiasm for manipulating company performance sometimes takes a less-than-savory turn, as arbitrageurs and other hedge-fund speculators attempt to use bad word-of-mouth to drive down stocks they've sold short. Author William Safire argues that the rise of hedge funds (private pools of investors, left relatively unregulated and often reliant on short-selling) increases market volatility,

making investing too dangerous for individuals. While classic economic theory claims that, as the time to disseminate information decreases, arbitrage opportunities should be fewer, since all markets will set values based on the same information. Thus legend has it that, in the early 1990s, a firm spent \$35 million on a supercomputer in order to gain a 2-second advantage in arbitraging stock futures (contracts to buy or sell a stock at a target price in the future) in Tokyo, Japan.

Other analysts argue that markets are inherently not capable of perfect efficiency because investors can make different, equally rational, responses to the same information. Some investors are interested in long-term gains, others in short-term gains. Markets can also price securities differently, these analysts argue, because some investors rationally, but wrongly, expect prices to rise or fall.

## MUTUAL FUNDS

For the present, time-based differences in information continue to present opportunities to profit illicitly from arbitrage. As of September 2003, New York Attorney General Eliot Spitzer was investigating several mutual funds for their policies of allowing a few select customers to trade shares at the daily closing price after the ordinary daily deadline, thus giving them the benefit of late news that would affect the fund's value the following day. This illegal arbitrage strategy was estimated by some researchers to reduce the fund's value to ordinary investors by a full percentage point. Said Spitzer after successfully prosecuting one hedge fund for \$30 million in illegal profits: "Allowing late trading is like allowing betting on a horse race after the horses have crossed the finish line."

## Archer Daniels Midland

BY THE MID-1990s, Archer Daniels Midland (ADM) became one of the largest transnational corporate producers of food in the world, partly as the result of financial subsidies provided by the U.S. federal government. While ADM has been instrumental in the development of the technology of genetically modified food and crops, company executives were convicted corporate criminals.

In the early 1990s, ADM conspired with Asian companies to fix the prices of lysine (an amino acid), a feed additive used to increase the proportion of lean meat in farm animals, a high-fructose corn syrup (a sweetener in soft drinks), and citric acid (a common substance used to provide flavor in food) in order to improve profit.

In 1989, ADM built the world's largest lysine plant and hired Mark Whitacre to manage the production division of lysine as well as the bio-products section. Initially, ADM offered cheaper lysine than its U.S. competitors, and as a result controlled half of the market. This resulted in a large oversupply, a price war, and ADM's loss of millions of dollars monthly. ADM then brought in Terry Wilson, the president of the Corn Processing Division to assist Whitaker in his role in the company. Wilson's role was to teach Whitaker how "fix prices," a commonly condoned practice at ADM, exemplified by

former Chief Executive Officer Dwayne Andreas, who once told his son, Michael, "The competitor is our friend and the customer is our enemy."

ADM's primary competitors in the lysine business were two Japan-based transnational corporations, Kyowa Hakko (and its United States-based subsidiary Biokyowa) and Ajinomoto with U.S. subsidiary, Heartland. Hakko and Biokyowa were the first companies to produce lysine. In the 1980s, these Japanese companies were selling \$30 million a year worth of lysine to the United States, and it was cheaper than the lysine made by U.S. organic chemical companies. ADM discovered that the Asian-based companies were buying dextrose from the United States and using it to develop their cheaper version of Lysine.

While Whitaker considered not complying with this philosophy of support for price-fixing, he remained at the company to try and do things differently. By 1992, lysine prices were at the lowest point and, thus, ADM began meeting with representatives of Ajinomoto and Hakko in Tokyo to engage in a price-fixing scheme. The agreement to fix prices was initially made at a series of meetings beginning as far back as 1992 in Mexico City. At that meeting and two subsequent meetings, ADM executive Terrance Wilson told other producers of lysine that "we are not cowboys, we should be trusting and have competitive friendliness."

They discussed how the low lysine prices were only benefiting the customers, not the manufacturers. So all of the companies involved agreed to raise the price of lysine. A series of additional meetings occurred throughout the year and included Korean companies as well. They formed what they called an Amino Acid Association.

Finally, six major lysine producers established sales quotas and prices for specific regions of the world. Later, ADM executives, Michael Andreas and Whitaker began to suspect that the Japanese companies were sabotaging the Decatur, Illinois, plant and brought this to the attention of the Federal Bureau of Investigation (FBI). While no evidence of actual sabotage was found, this initial relationship with the FBI led Whitaker to become concerned about the FBI discovering the price fixing, so he informed the FBI on his own initiative, and became an undercover agent for the FBI (sometimes referred to as a whistleblower).

However, Whitaker alleged that he was forced, through threat of legal sanctions by the FBI, to con-

tinue his involvement beyond his own wishes and provided a variety of recordings of his dealings at ADM.

In 1995, a grand jury issued subpoenas for all information on price-fixing by ADM and its co-offenders. Subsequently, the FBI raided the company's headquarters and seized a variety of relevant documents. Meanwhile, Whitaker was fired for alleged embezzlement, after the company found out he was assisting the FBI. ADM sued Whitacre for \$30 million and he retaliated by accusing the company of knowingly selling contaminated cattle feed. Whitacre was later convicted of stealing millions of dollars from the company and, although he initially claimed that the money was provided by ADM as a bonus, he later confessed to taking millions of dollars from the company.

By February 1996, farmers, cattle owners, and stockholders filed 85 class-action lawsuits against ADM. Moreover, the U.S. Department of Justice also filed conspiracy-to-fix-prices charges. In 1996, ADM was charged with violations of the Sherman Antitrust Act. Finally, three Asian co-defendants in the case pled guilty and provided information about ADM to the government. These three defendants paid over \$20 million in fines for conspiring to raise the price of lysine. A month later in 1996, ADM pled guilty to two counts of collusion to set prices on citric acid and lysine and paid \$100 million in penalties, \$70 million in the lysine case, and \$30 million in other penalties. ADM also cooperated with the Justice Department with regard to prosecution of Michael Andreas and Wilson.

Subsequently, Dwayne Andreas stepped down as chief executive. Even though these were the largest fines to ever be brought against an American corporation for antitrust violations, it was still small in contrast to the profits that ADM made from the price-fixing scheme. Many of these details were publicly suppressed by the Justice Department as the result of ADM's cooperation, in addition to the fact that ADM was granted immunity on the charges of price fixing of the high-fructose corn syrup. In 1996, a federal grand jury indicted Whitacre, Michael Andreas, Wilson, and the director of Ajinomoto on charges of conspiring to fix the global prices for lysine. Whitacre was also charged with 45 counts of wire fraud, money laundering, conspiracy, obstruction of justice, filing false income tax returns, and interstate transportation of stolen property. He tried to commit suicide

as the result of his argument that the government was hurting him, when he cooperated with the FBI all along.

In March 1998, Whitacre was sentenced to nine years in prison and was ordered to repay \$11 million to ADM. In September 1998, Michael Andreas, Wilson, and Whitacre were convicted of conspiring to fix lysine prices. Although the maximum punishment for such offenses could have been three years in prison and a fine of \$350,000, Andreas and Wilson were sentenced to two years in prison and fined \$350,000. Whitacre was sentenced to another two-and-a-half years for the price-fixing.

## GENETICS

However, ADM still stacks conditions in its favor by selling nongenetically modified grains at a higher price than the genetically modified ones. It remains a leader in food sales and exports, and is one of the largest grain suppliers in the globe; ADM still has a great deal of control over whether or not the food we eat will be genetically modified. While some countries, such as Great Britain refuse to sell such food products, that does not prevent genetically modified food from appearing in our diets as over three-quarters of the world's genetically modified crops are fed to farm animals, thus genetically modified food remains present in the food chain.

In 2003, ADM was working on the production of second-generation genetically modified crops that will provide food with medicines and nutritional supplements. ADM maintains production companies in over 40 countries across four continents with subsidiaries operating under different names.

## Argentina

A CENTURY AGO, Argentina was one of the richest countries on earth. Now, after decades of mismanagement, corruption, and repeated financial meltdowns, the over-indebted country finds itself gripped with rising levels of poverty (50 percent of Argentines lived under the poverty line in 2003), unemployment, and crime.

In the case of Argentina, one cannot talk about organized crime as a phenomenon existing on the margins of society because of the active involvement of political, law-enforcement, and military officials in criminal activities. Thus, aspects of white-collar and corporate crime and intertwined with other criminal categories. In 2001, for instance, former President Carlos Saúl Menem spent six months under house arrest for his alleged involvement in illegal arms sales to Ecuador and Croatia, which was under a United Nations arms embargo. Until the Argentine Supreme Court unexpectedly dismissed charges against Menem, his economy ministers and others, it was alleged that the president had received large payments, deposited in a Montevideo (Uruguay) bank account, for his assistance.

Menem has also been dogged by accusations that members of the security services were actively involved in the July 1994 bombing of the Jewish Community Center in Buenos Aires, which claimed the lives of 85 people. It is also alleged that the president and other high-ranking officials were handsomely paid for their complicity in the attack.

In January 1997, on the orders of Alfredo Yabrán, a politically connected underworld kingpin, prominent photo-journalist José Luis Cabezas was shot to death in Buenos Aires. The journalist had been investigating the Jewish community center bombing, and the activities of Yabrán who was found guilty of masterminding the murder in February 2000. The murder of Cabezas marked the beginning of a troubling trend in newly democratic Argentina: the attempt to muzzle or coerce investigative journalists reporting on official corruption and organized crime by using lawsuits, assassinations, attempted killings, beatings, and other forms of criminal intimidation, harassment, and blackmail.

In spite of the economic crisis, Argentina remains an important market and trans-shipment point for international, illegal-drug smugglers, but

there is as yet little drug production in the country. Since the crash of the Argentine peso and cash-crunch, individual Argentines barter their possessions (jewelry, for instance) for drugs, while the gangs exchange stolen luxury vehicles and arms for theirs.

Many have also turned to cheaper drugs such as crack and *bazuko* (poorly refined cocaine paste usually mixed with a number of chemical products and smoked with tobacco or marijuana), while dealers (mindful of shrinking profit margins) have been diluting and adulterating their products with a number of dangerous chemicals. Argentina also remains an important trans-shipment point for cocaine and heroin, produced in Bolivia, Peru, and Colombia, destined for the United States, Europe (going primarily through Spain), and Australia (often via New Zealand).

Another area of concern is the Triple Border area which has been characterized as a haven for smugglers, traffickers, scoundrels, and terrorists. Since the terrorist attacks of September 11, 2001, the area has come under increased scrutiny from Argentine and international intelligence agencies because of its links to international terrorism. The Triple Border (total population of some 600,000) is made up of three cities: Foz de Iguazu (Brazil); Puerto Iguazu (Argentina) and Ciudad del Este (Paraguay). The latter is a hub for arms, drugs, and people smuggling, as well as product piracy (cigarettes, electronics, and consumer goods), currency and document counterfeiting, stolen vehicles, and money-laundering.

Such crimes are starving Argentina's state treasury, while increasing violence and the threat of kidnapping are keeping international investors away. This is why Argentine President Néstor Kirchner took action in the early 2000s to crack down on tax evasion, money-laundering, and crime, but the lure of easy profits remains strong for most.

## art fraud

ART FRAUD IS THE deliberately false representation of the artist, age, or origins of a work of art in order to reap financial gain. Forgery of a famous artist’s work is the best-known kind of art fraud. But fraud may also result from the knowing misattribution of the age or origin of a work of art, for example if an art dealer were to falsely assert, for the purpose of making a greater profit, that a statue was from 5th-century Greece, or that a vase was from the Chinese Ming dynasty; works from a particular region or time period may be deemed more valuable on the contemporary art market. Art fraud is motivated by the large sums of money that can be obtained for works of art by famous artists or are otherwise rare or unusual.

The copying of famous works of art dates to the origins of the history of collecting, and therefore to the beginning of the history of art. In the ancient world, replicas were made of famous works in order to satisfy demand by collectors for these works. One such statue was the 5th-century *Spear-bearer* by the Greek artist Polykleitos that had great fame for its perfect proportions and beauty, and was often copied for admiring Roman collectors in subsequent centuries. Polykleitos’ statue, made of bronze, did not survive into the modern era, but the classical Roman marble copies remain, and these copies supply our only knowledge about the original.

A copy of a famous work does not constitute art fraud; rather it is the sale of a copy under false pretenses that is fraudulent. It was in the Renaissance that intellectual property, the idea that an artist creates a work of art that belongs to her, again became a significant factor in artistic production. When the value of a work of art resides not solely in the beauty of the object itself but also in the name of the creator, there is motivation for fraudulent claims of authorship. The Renaissance artist Michelangelo (1475–1564) objected to the misattribution of his work; it was reported that when he

discovered that another artist was receiving credit for sculpting the famous *Pietà* (today in Saint Peter’s basilica in Rome), Michelangelo returned with his chisel and added his signature across the center of the sculpture, on the prominent sash across the Virgin Mary’s upper body: “Michelangelo Buonarroti, Florentine, made this” (English translation).

In the 18th and 19th centuries, the mania for classification and study of the past resulted in an upsurge in forgeries as the art market adjusted to accommodate the new interest in the artistic past. This interest in the classification of the past also led to the founding of academic disciplines such as the history of art. The study of art history and the creation of agreed-upon bodies of work for artists and eras, as well as the advances of science, have made possible in the 20th century the winnowing out of forgeries and fakes from authentic works. As art historians gain more knowledge about the past and the style, materials, and working conditions of artists and historical epochs, fraudulent works are more readily exposed.

## DETECTING FRAUD

Despite this kind of knowledge, it is still today a complex undertaking to detect art forgeries. It is especially difficult to weed out forgeries in the work of modern artists whose large numbers of works and contemporary fame make them more attractive to fraudsters. Pablo Picasso, for example, was a prolific artist, creating a huge number of works on canvas and on paper. Considering the number and the varying styles and media in which he worked, the established number of his works is difficult to pin down. His fame and the prestige associated with owning one of his works has offered strong motivation to forgers, and the difficulty of precisely attributing a Picasso, especially a drawing, makes fraudulent representations of his work hard to control.

The work of the artist Salvador Dalí (1904–89) is also vulnerable to forgers because he also created a large number of works on paper. Dalí inspired another set of complicated issues with regard to authenticity on the occasions when he signed blank pieces of paper before the print runs of his work. An assertion of illegal activity in the art market depends on tenets of intellectual property: Dalí was entitled to the proceeds of his own work and collectors who buy a work by the artist should be able to

have confidence that it is authentic. But the artist himself subverted the idea of authenticity by applying his signature to something that had not yet been created.

Certain contemporary conditions have increased the prevalence of art fraud. The popularity of art as an investment in the 1980s and 1990s propelled the art world to greater visibility and expanded the market for works of art. With more collectors and museums vying for an ever-smaller number of works by famous artists or from esteemed eras in the history of art, motivations for fraud have been exponentially increased. At the same time, modern science has made it possible to authenticate works of art to a greater degree than at any time in the past, though even these scientific tests lead at times to ambivalent results about the age and/or authenticity of a work.

Forgers may attempt to trick scientific tests by using or plausibly imitating authentic materials. A famous case is that of the forger Han van Meegeren (1889–1947), who used a paint mixture that was modern, but that sufficiently copied an older technique so that his paintings were certified, as he intended, as originals by the Dutch 17th-century master Johannes Vermeer. The masking of the age of paint materials usually can be discovered with further testing, but often museums or collectors are satisfied with initial results and the fake may pass without further testing.

Art fraud is difficult to control because the art market is enormous, unwieldy, and greatly varied, stretching from Victorian buttons to Greek 6th-century vases, from medieval pilgrims' badges to contemporary photographs. Business is often conducted under the veil of secrecy, with buyers wishing to remain anonymous to avoid the attention of burglars and other opportunists. It would be logistically impossible to monitor all of the transactions between dealers, private collectors, and museums that are in the business of acquiring art.

Suspected art forgeries can generally only be considered on a case-by-case basis, because they can usually be identified only by an expert in the field. But experts themselves may be biased to find particular characteristics in an "authentic" work, and it is not unusual for two experts to have wildly different opinions of the authenticity of the same object, based in each case on reputable evidence. Forgers also have strategies to avoid detection, such as van Meegeren's paint materials, that were appropriate to

the era and artist. The identification of fraud is also complicated by the emotions involved with collecting. Collectors may be taken in by forgeries simply because they desire to own the work of art so greatly that their reason is clouded by emotional attachment; they may simply wish to believe that it is authentic.

The difficulties of authenticating works of art are also complicated by collecting areas such as Australian aboriginal art, where the Western standard for production, in which one artist creates a work that is then sold on the market with that artist's name, is not necessarily a part of the indigenous artistic tradition. The production of Aboriginal art itself has been affected by art fraud, as Aboriginal artists alter their methods of production in order to satisfy demands by the art market for "authenticity."

Art fraud is directed by the way in which value is assigned to works of art in the market. Generally, the most valuable works are those that are most rare, such as Old Master paintings, those that are most desired at a particular moment (by a new artist who witnesses a rush on her works, for example), or from a particularly esteemed period, such as American Abstract Expressionism. These values can fluctuate based on the larger economy, or on particular biases (contemporary artists are particularly vulnerable, for example, to the vagaries of fashion), or on publicity. For example, an exhibition on Paul Cezanne landscapes might inspire a jolt upward in values of these works, or a movie on Jackson Pollock that broadens the visibility of his work might increase demand. Art fraudsters then illegally meet the demands of the art market by supplying these highly desired works of art under false pretenses. There is a focus in the media on art fraud involving paintings and sculpture, but counterfeiting of jewelry and other minor arts may indeed be more common. These small works are more easily disguised since the authentic works are less well-known.

#### SMUGGLING AND PROVENANCE

Another area of art fraud motivated by the demands of the art market involves the smuggling of works of art out of countries, especially in the third world, where the value of the work may be poorly understood. Though smuggling is in itself a crime, art fraud may also occur when the smugglers make it seem to guardians of cultural patrimony or cus-

toms officials that the works are not at all valuable. They then appear on the market in wealthier countries for sale for large sums. There are sanctions against museums that buy these works, but governments of these countries have little recourse when the objects disappear into private collections.

An important strategy for combating art fraud is research into the history of ownership of the work (called provenance) and the mention of the work in archival records. Genuine works of art appear in historical records and are owned by individuals, and one way to determine the authenticity of a work is to establish this kind of history. Marks of ownership may be found on the object itself, such as owner's stamps, or dates signifying change in ownership may be written on the object. Needless to say, it is also possible to forge historical marks on a work, so it is not possible to say definitively with only provenance research that a work is genuine.

Fraud may also result from a falsified provenance. Provenance is crucial to a work's market value, because art museums generally avoid purchasing works of art that do not have a provenance (for fear that they may have been stolen, and that the wronged owner may surface and claim the work). It is also bad publicity for a museum, especially a public museum, to be associated with any fraudulent activity in the art world.

## EMBARRASSMENT

Finally, art fraud is difficult to prosecute because it may require an embarrassing admission on the part of the collector or the museum curator that he has been duped. This lack of willingness from those who were conned inhibits the exposure and investigation of fraud. Museums, for example, only very rarely acknowledge that works of art in their collection are perhaps not authentic. The Museum Boymans-van Beuningen in Rotterdam, Holland, was forced to acknowledge that the *Supper at Emmaus* in their collection, supposedly by Johannes Vermeer, was actually painted in the 1930s by van Meegeren, but only after the forger himself admitted it, in the context of another investigation. The original collector, D.G. van Beuningen, continued to refuse to believe, despite this admission, that the work was not by Vermeer.

In addition, museums are loathe to announce that a work of art may be fake, only to later perhaps discover that it is authentic. Such a complicated

case is that of the Getty *Kouros*, an allegedly 6th century B.C.E. male sculpted figure owned by the J. Paul Getty Museum in Los Angeles, California, that has been under constant suspicion that it is a modern forgery. The Getty paid a very high price for what it believed was one of the only remaining 6th century *Kouros* figures on the art market, only to discover that it had stylistic irregularities that suggest it cannot be authentic. At the same time, scientific tests have not shown it to be a modern forgery, and some scholars argue that the stylistic anomalies are not necessarily evidence that it is a fake. The Getty exhibits the works in its galleries with a label that reads: "circa 530 B.C.E. or modern forgery."

## VICTIMS

The victims of art fraud are the artists and museums who own the works, collectors who are defrauded through purchase of forged works, and museums who may use public or donated money to buy fraudulent works of art. Countries that lose valuable works of art to the international art market under false pretenses are also subject to art fraud. It is these owners and collectors of works of art that have the greatest interest in eradicating art fraud.

The Art Loss Registry is one large organization that maintains a database of stolen works of art and works to ensure and maintain the integrity of the art market. Interpol also tracks art smuggling. City police forces may also have "art fraud squads" such as that in the New York City Police department that investigate cases of art fraud on the local level. But the first, and in many cases only, line of defense against art fraud are the dealers who offer the works for sale and the museums and collectors who must make every effort determine the authenticity and legality of the works at the moment of sale.

## Arthur Andersen

ON JUNE 16, 2002, the accounting firm of Arthur Andersen was found guilty of a felony charge of obstructing justice in the Securities and Exchange Commission (SEC) investigation of the collapse of the Enron Corporation. At the time of the conviction, Andersen was one of the five largest accounting firms in the world with approximately 85,000 employees across the globe. Within a year of the conviction, employees of Andersen numbered less than 300.

At the order of David Duncan, lead auditor for the Enron account at the firm's Houston, Texas, office, Andersen partners and staff destroyed more than a ton of Enron documents and deleted over 30,000 e-mails and computer files that were allegedly confidential to the account. The 17-day purge ended on November 9, 2001, when the SEC issued a subpoena for Andersen to cooperate in the investigation.

Once a leader in the accounting profession, both in bringing greater accountability to publicly traded corporations and in raising the level of professionalism for accountants, Arthur Andersen & Co. had earned a reputation over its 89-year tenure for responsible auditing and public stewardship. Arthur Andersen, a professor at Northwestern University, guided the Chicago-based partnership through the Great Depression and two world wars. But as the firm sought to maintain profitability through the 1950s and beyond, a gradual shift of focus from public accountability to client satisfaction brought about a series of subtle changes that would lead to scandal by the late 1990s.

The primary factor in the accounting firm's changing culture was the development of consulting services. First implemented in 1952, consulting teams offered services that met needs in the changing marketplace, particularly in the area of computer technology. Despite criticisms that consulting posed possible conflicts of interest, consulting rev-

enues stabilized accounting firms such as Andersen in a corporate climate where auditing brought in decreased revenues at greater risk of litigation. In 1988, Andersen's consulting services became a separate business unit by the name of Andersen Consulting. During the 1990s, consulting revenues outpaced auditing, and in August 2000, Andersen Consulting separated entirely from Arthur Andersen and became known as Accenture.

Another factor in Andersen's increasingly client-focused culture was a 1992 shift in the firm's leadership that replaced older, more conservative partners with younger individuals who supported a new stress on sales and closer relationships with auditing clients. Andersen employees were encouraged to take "out placement" jobs with client firms and client satisfaction became the firm's focus rather than the traditional public stewardship goal of previous decades.

After this leadership shift, Andersen became embroiled in a number of litigations, including the Baptist Foundation of Arizona (BFA), Sunbeam Corporation, Boston Market Trustee Corp., Department 66, and Colonial Realty, most of which were settled with little media attention. In the case of Waste Management, Inc., the SEC charged that Andersen had issued five years' worth of misleading audit reports and levied a fine of \$7 million to settle the case out of court, then the largest fine ever levied against an accounting firm, and Andersen paid \$75 million to settle civil lawsuits.

SEC Chair Laura Unger cited the case as proof of why consulting services posed a clear conflict of interest: Andersen Consulting had collected a total of \$11.8 million from Waste Management; Arthur Andersen had collected \$7.5 million for auditing fees.

In the case of the Enron Corporation, Andersen had engaged in questionable auditing practices that included both external and internal auditing, as well as auditing Enron's internal control system. The Enron account's lead auditor, Duncan, overrode warnings from Andersen's internal regulators and persisted in a close relationship with the corporation that centered on customer satisfaction. Andersen's auditing practices, however, were never formally indicted.

## asbestos

THE VERY term *asbestos* conjures up an image of greedy manufacturers so involved with profits that they ignored the safety of their employees for decades, possibly for centuries. Even when it became public knowledge that there was a direct link between exposure to asbestos and a number of diseases and deaths, those same manufacturers attempted to sidestep their responsibilities.

By definition, asbestos is a strong and flexible fibrous material that is resistant to fire, heat, and corrosion. The fact that asbestos has an infinite half-life has made it even more desirable. The properties of asbestos have made it ideal for a wide range of products that include: insulation, brake-lining, clutch facings, roofing, flooring, pipes, packing, gaskets, protective clothing, gas masks, grinding wheels, fire retardants, drywall patching compounds, dish towels, and fire-proof toilets.

Medically, the issue of asbestos has been concerned with treating the effects of exposure on the lives and the health of those who have been in contact with the material in some way. Legally, the issue of asbestos has been involved with handling the claims of litigants in courtrooms around the country. Politically, the issue of asbestos has been concentrated on ensuring accountability for those at fault, justice for those who have suffered, and prevention of asbestos-related problems for present and future generations.

Physicians and medical researchers have shown that when individuals inhale asbestos fibers, they are likely to contract asbestosis, a clogging and scarring of the lungs that may lead to reduced breathing capacity. Lung cancer has been documented as the

second most prevalent disease among those who have been exposed to asbestos. The occurrence of mesothelioma, which is a cancer of the lining of the chest and abdomen, has also been documented.

This latter form of cancer progresses rapidly, is always fatal, and has been identified only in patients who have been exposed to asbestos. Workers exposed to asbestos are most likely to be males who worked in shipyards or in factories that produced insulation or other asbestos products. Even after the use of asbestos was prohibited in the late 1970s, maintenance workers by the thousands were exposed during asbestos-removal projects because they neglected to use respirators, and through improper handling of discarded asbestos material. It has been estimated that by 2013, between 74,000 and 265,000 asbestos-related deaths will have occurred. Government estimates place the number of workers exposed to asbestos at 11.5 million. In that same period, it is expected that compensation from asbestos-related claims will have cost Americans between \$4 billion and \$38 billion.

### ASBESTOS IN HISTORY

Some researchers have documented the use of asbestos as far back as the time of Jesus Christ when historian Pliny referred to using the transparent bladder skin of animals as inhalers to protect slaves from inhaling disease-causing construction material. By the 1930s, scientists in the United States, Great Britain, and Germany had documented the connection between exposure to asbestos and cancer. Researchers noted that while even slight exposure to asbestos could cause cancer; the risk was highest for those who were exposed to large amounts of asbestos over a long period.

As early as 1943, records show that the asbestos industry in the United States was aware of medical reports on asbestos as a carcinogenic. Despite knowledge of the dangers of asbestos, until the 1970s employers continued to use asbestos products and failed to provide employees with warnings about the dangers. Use peaked in 1973 when 795,000 metric tons were used. By 1979, that number had dropped to 560,000 metric tons.

From the beginning, a number of significant factors came into play with the asbestos issue. First, asbestos products have been widely used in a number of American homes, buildings, and automobiles over a lengthy period of time, exposing

millions of people to the effects of asbestos. Second, the lengthy period between the time of exposure to asbestos and the onset of asbestos-related diseases has raised questions about the legitimacy of the initial claims. From 15 to 40 years may elapse between exposure to asbestos and the appearance of asbestos-related diseases. For example, individuals who were exposed to asbestos in shipyards during World War II became ill and filed lawsuits in the 1980s.

Third, the stakes involved in asbestos cases have been enormous. Workers' compensation policies have generally prevented workers from filing claims against their employers, so litigants have sued asbestos manufacturers, suppliers, and processors who declare bankruptcy to prevent their companies from going under. Over 50 percent of asbestos-related cases have been dealt with by federal courts. By 1983, lawsuits had been filed in 48 states. Almost 70 percent of the cases filed in state courts involved California, Massachusetts, New Jersey, Pennsylvania, and Texas.

Asbestos suits were most likely to name the Manville Corporation, which was the largest asbestos manufacturer in the world, employing 25,000 workers in more than 50 factories and mines in the United States and Canada. Other defendants in asbestos litigation included: Fibreboard Paper Products, Pittsburgh Corning, Owens-Corning, Union Asbestos and Rubber Company, Combustion Engineering, Eagle-Picher, Philip Carey Corporation, Armstrong Convecting and Supply Corporation, Rubberoid Corporation, and Standard Asbestos Manufacturing and Insulating Company. Finally, the outcome of the asbestos cases had an enormous impact on other litigation that had arisen from other toxic torts.

The first asbestos lawsuit was filed in August 1961 by Claude J. Toplait, a 20-year veteran of the asbestos industry. Toplait had been diagnosed with severe shortness of breath as a result of extensive lung damage and "finger chubbing," a thickening of the fingertip tissue. He had also been tentatively diagnosed with pulmonary dust disease. All three conditions were caused by exposure to asbestos. Toplait received a \$75,000 settlement. Over the next three and one-half years, new medical information on asbestos-related diseases surfaced, firmly documenting the link between asbestos exposure and an increasing number of deaths and diseases around the country. The research of Dr. Irving J. Selikoff of

Mount Sinai School of Medicine was particularly significant: he believed that there had been between 8,000 and 10,000 thousand deaths in the United States between 1940 and 1980 due to exposure to asbestos.

In mid-1965, the American Law Institution published a new definition of tort law that called for strict liability on the part of manufacturers and sellers of harmful products. The reform made it easier to bring lawsuits, and an influx of asbestos-related cases were filed. The decision was made to certify asbestos claims as class action lawsuits because individual lawsuits were resulting in vastly disparate judgments varying from a few thousand to several million, and these cases were clogging court calendars throughout the United States judicial system.

Participants in class action lawsuits also had the advantage of teams of lawyers, researchers, and expert witnesses that gather and present evidence to support their claims. It became evident early in the investigation into asbestos claims that manufacturers had willfully covered up the health dangers related to asbestos exposure. The Asbestos Claim Facility (ACF) was created to oversee disbursement of the millions of dollars in asbestos payments awarded to claimants.

## Asia

ASIA IS A VAST continent, home to around one half of the world's population. It encompasses the deserts of Arabia to the west, the frozen wastes of

Siberia to the north and the heavily populated cities of India and China to the south and east. Each part of the continent has been home to a variety of ethnic groups, cultures, and religions. As these have met and interacted, it is no surprise that a great number of attitudes and approaches to business have developed over the years.

As a result, the relationships between business organizations, government and society are significantly different across the continent. Although there has been a degree of homogenization of systems as a result of the emergent dominance of Western style capitalism and globalization, significant differences still remain.

When members of different systems came into contact with each other, there can be an appearance of abuse as well as its substance. For example, in many parts of mainland Southeast Asia there is a legacy of voluntary bondage as security for loans or to meet debit payments, that has become aligned with some forms of industrial working conditions considered unacceptable by most of the Western world. Similarly, the need perceived by successive administrations of South Korea to create a strong industrial base to mitigate against the possibility of invasion by North Korea has led to systemic attacks

on workers' ability to organize themselves into labor unions. Throughout the continent, the spectre of communism has been used to justify strong government-business links which have given rise to some large-scale conflicts of interest as well as abuse of the working classes. Conflicts of interest have often focused on the ownership of natural resources and the right to profit from their exploitation, often linked with environmental degradation, the maintenance of secrecy regarding business agreements when security interests are cited, and the practice of business people buying undue influence with government officials and agencies.

#### ASIAN APPROACHES

Much of western and southern Asia is dominated by Islam and, as the Islamic world has moved closer to or further from fundamentalism, distinctively Islamic attitudes toward business have emerged or retreated. As the prophet Muhammad himself was a merchant, Islamic belief has generally embraced commerce as an appropriate and moral activity. Other Asian thought systems have more problematic approaches to trade. Confucianism, for example, attaches great importance to the perfection of

*Tokyo, Japan, has its own variety of business and corporate crime.*

*Hong Kong, China, has remnants of British colonial corruption.*

*Shanghai, China, mixes capitalism crimes with communist politics.*

the individual in this world and the importance of harmony and order in relationships at all levels.

Buddhism, too, is concerned with the avoidance of bad or immoral deeds which will come to punish the individual in this life or in a future incarnation. Both of these thought systems are amenable to regulation by states to require business people to submit to the will of the state, and to avoid the search for profits above all else. Chinese, Korean, and to a lesser extent Japanese state beliefs required individuals to remain active only within their own regional networks and, hence, make it very difficult to establish long-range trading networks without sacrificing social standing. In these cases, along with the caste society of India, separate classes of people either specialized in, or were required to undertake commercial issues, and it was considered perfectly acceptable for the state to tax them at whatever rate might be desired.

As a general rule throughout the continent, business is conducted on the basis of trust and relationships rather than of written, contractual agreements which are more common in the Western world. This means that the Asian business person will be as interested in the background, family, and network connections (university, hometown, or other affiliation) rather than specific products or services being marketed. It is as a result of these kinds of relationships that cross-border trading networks have been established to assist the growth to prominence of Chinese migrants throughout East Asia, and further afield, also Indian migrants overseas.

#### EAST ASIAN WHITE-COLLAR CRIME

The rapid economic development of the Asian "Tigers" or newly industrializing countries of east Asia, especially the Republic of Korea and Taiwan, provided examples of heavy protectionism, export promotion and the extensive use of government-linked corporations. The attempt to secure rapid industrialization and economic development was rendered more urgent by security considerations, since both felt the threat of more powerful militaristic neighbors with strong motives to overrun them. The business environment created in these cases (and in the strict societal and business control also enforced in Singapore, another of the Tigers) has stimulated a number of ethical concerns which hinge upon the tension between personal liberties

and the national interest. Western companies doing business with these states must consider whether it is consistent with such ethical positions as they may have professed to collude in the suppression of labor rights, among other issues.

#### COMMUNIST CAPITALISM

The collapse of the Soviet system has released a number of states in central Asia from command economies and strongly controlled political regimes. The regimes that have replaced those enforced by the Soviet system have proved themselves to be of varied utility to their people, many of whom have become alienated from the state which is viewed as predatory to their interests. As a result, corruption and fraud have grown to significant levels as individuals have no reason to believe that the state will concern itself with their interests.

This, combined with weak cross-border controls, the presence of large amounts of illegal narcotics from Afghanistan and neighboring countries, numerous refugees and weapons from the many wars in the region have greatly stimulated illegal industries in prostitution, smuggling, money-laundering and human trafficking. Similar stimuli are also present in China and Vietnam, states which retain an overt communist state ideology, but which have economies moving through transition toward market-based systems; this has produced high levels of white-collar crime.

#### FINANCIAL CRISIS OF 1997

In 1997, the onset of an Asian financial crisis was signaled by attacks on the baht, the currency of Thailand. As a result of some weaknesses in banking systems, the irrationality of international investors and unevenness in the economic development of various East Asian states, a form of financial contagion then passed through the Philippines, Indonesia, Malaysia, Korea and other states, affecting each to a greater or lesser extent. Those affected most severely were obliged to accept both emergency assistance from the International Monetary Fund (IMF), and the conditionality attached to the loans.

The impact of the financial crisis, which was worsened by IMF conditionality, caused large numbers of bankruptcies and cut redundancies. Many of those who lost their jobs were able to return to

provincial homes and pick up agricultural activities. However, for those for whom this was not possible, alternatives included prostitution or becoming involved in crime. Inevitably, job losses took their toll on the most vulnerable and those least able to protect themselves, and these people also became prey to human traffickers and to unscrupulous overseas labor agents.

## AT&T

AMERICAN Telephone and Telegraph (AT&T) traces its roots back to founder Alexander Graham Bell's invention of the telephone in 1875. As a subsidiary of American Bell, AT&T began to manage long-distance services in 1884. Within four years, AT&T had become the parent company in a two-for-one swap.

Financial wizard J. P. Morgan took over the company in 1907. Morgan decided that AT&T would grow through acquisition, and AT&T developed a reputation as a "ruthless, grinding, oppressive monopoly." AT&T resisted efforts to curtail its progress for the next 70 years.

By 1888, both the Democratic and Republican party platforms called for antitrust legislation, and the U.S. Congress complied with the Sherman Antitrust Act in 1890. Beginning with the presidency of Theodore Roosevelt, the U.S. government was determined to bring an end to the anticompetitive actions of large trusts. The federal government began to keep a watchful eye on AT&T after a 1909 merger with Western Union. The following year, the Interstate Commerce Commission (ICC) was given regulatory responsibility for telephone serv-

ices. In 1911, Standard Oil and the American Tobacco Company were broken into smaller divisions. Even though AT&T had given up its controlling interest in Western Union, in 1913 the government filed an antitrust suit against AT&T.

The conclusion of the investigation was that AT&T was a "natural monopoly" that had formed in response to increased demands for communication services, and to the lack of competing companies that could meet those demands as efficiently as AT&T. As a "natural monopoly," AT&T ruled the communications market for decades. However, as new technologies were developed, rivals appeared on the scene and began to challenge AT&T.

In 1934, as part of Franklin D. Roosevelt's New Deal, the Federal Communications Commission (FCC) was created and assumed regulatory responsibility for the communications industry, and AT&T became the target of its first investigation. In 1949, the government again sued AT&T for antitrust violations with the intention of forcing Western Electric and Bell Laboratories to break away from the rest of the system. The suit dragged on until 1956 when AT&T agreed to a consent decree that allowed the company to retain control of Western Electric and Bell Laboratories and promised to stop expanding into other fields of communication. However, AT&T argued that the government's actions were unfair because AT&T was prevented from expanding its services while rivals continued to make significant advances.

The federal government continued its interest into AT&T activities; in 1976, the FCC handed down what became known as Computer Inquiry II, officially ending AT&T's designation as a "natural monopoly" and nullifying the 1956 consent decree. The final element of Computer Inquiry II was handed down in 1980, making a distinction between "basic services," which were subject to federal regulation under the Communications Act of 1934, and "enhanced services," which were open to all competitors. Enhanced services included videotext, protocol conversion, information storage, packet switching, and data transmission.

While preventing AT&T from expanding into other fields, the FCC supported the expansion efforts of other companies, even when it meant using AT&T's technology and equipment. For example, in 1968, the FCC forced AT&T to allow Carter Electronics Corporation of Texas to plug the Carterfone into the AT&T telephone system. The

following year, Microwave Communications, Inc. (MCI) was allowed to develop its point-to-point microwave line and to sell private-line services to both individuals and businesses, and the government required local companies to provide links for MCI's long-distance service. MCI then began to lobby the federal government to end AT&T's monopoly. In 1974, as AT&T was attempting to comply with Computer Inquiry II, the Department of Justice filed a new antitrust suit, charging the company with monopoly and conspiracy to monopolize telecommunication services and products.

The suit reached the trial stage in 1981 despite two separate attempts by AT&T to settle out of court. Also in 1981, a federal court awarded triple damages to MCI that totaled \$1.8 billion, charging AT&T with engaging in anticompetitive practices. Not satisfied, MCI announced that it was suing AT&T for an additional \$3 billion. Two decades later, along with other long-distance carriers, AT&T sued MCI, which was in the midst of bankruptcy proceedings, claiming that MCI had routed long-distance calls through Canada, forcing AT&T to pay local phone companies for the costs of transmitting calls.

Deregulation was the order of the day in the 1980s, and the United States government finally succeeded in doing what it had begun decades before. At noon on January 8, 1982, William Baxter, the assistant attorney general for antitrust, and Charles L. Brown, chairman of the board of AT&T, announced a new consent decree that broke AT&T up into smaller companies. By 1984, the division was complete. AT&T was divided into AT&T Communications and AT&T Technologies. Long-distance services were dealt with by AT&T Communications. AT&T Technologies encompassed Bell Laboratories, network systems, technology systems, international services, consumer products, and information systems. Local rates became the province of the 22 "Baby Bells" created around the country, encompassing seven geographic regions. The "Baby Bells" were prohibited from providing information services and manufacturing equipment and were required to provide equal access to phone lines to all long-distance carriers.

Senator Barry Goldwater (R-AZ) epitomized the reactions of a number of people around the country: "I fear that the breakup of AT&T is potentially the worst thing to happen to our national interest in telecommunications that will ever occur." The im-

mediate result was general customer dissatisfaction with having to choose a separate long-distance carrier and with lengthy waits for repairs. Rates for telephone services began a steady rise of around \$200 per year. Critics of the government's actions argued that the breakup of AT&T led to everything from blocked technical services to a threat to national security.

AT&T became the number one long-distance service provider in the United States and continued to expand its service. In July 2000, the Federal Trade Commission (FTC) opened an investigation into AT&T's relationship with Time Warner in which AT&T holds a 9 percent interest. The powerhouse merger of Time Warner and America Online (AOL), approved by the FTC on December 14, 2000, caused concern among AT&T's rivals which were afraid that the AT&T relationship with AOL Time Warner would set the stage for exclusive access to communications services.

In October 2003, it was reported that AT&T and Bell South (one of the Baby Bells) had resumed merger talks that had stalled two months before. If successful, Bell South would have bought AT&T, and the merged company would become known as AT&T.

## Australia

BEGUN AS a British penal colony, Australia is now one of the most law-abiding nations on earth. Nev-

ertheless, as is the case in many modern societies, the phenomena of corporate, organized, and white-collar crime have blossomed in recent years, thanks largely to ever-increasing profits. Australia holds an important position in the study of white-collar crime, namely through the work of three Australian scholars: John Braithwaite, Brent Fisse, and Duncan Chappell.

Braithwaite, a professor at Australian National University, pioneered new research and theories in white-collar crime. In his book, *Corporate Crime in the Pharmaceutical Industry* (1984), Braithwaite reports: "Pharmaceutical companies face great temptations to mislead health authorities about the safety of their products. It is a make-or-break industry. Many companies get virtually all their profits from just two or three therapeutic winners. Most of the data that the Australian Drug Evaluation Committee relies upon in deciding questions of safety and efficacy is data from other countries, particularly the United States. Inquiries into scientific fraud in the United States have shown there is a substantial problem of fraud in safety testing of drugs in America, just as has been documented in Japan."

Braithwaite's other books and work focus on corporate crime and accountability, and more recently, restorative justice and responsive regulation (examinations of retribution versus restoration in corporate criminal punishment).

Australian attorney and author Fisse is a specialist in trade practices law, intellectual property, e-commerce, and on-line services and liability control systems for corporations. He developed the theory of "organizational blameworthiness" for corporate crime and has argued that the common practice of imposing monetary penalties as sanctions against corporations does little to deter future bad behavior.

Lawyer and criminologist Chappell studies the rise of workplace violence, explaining in one paper, "Workplace violence is not merely an episodic problem created by deranged persons, but is a highly complex issue rooted in wider social, economic, organizational, and cultural factors."

Chappell's research recommends specific solutions to workplace violence, including adopting criminal and civil law remedies for not only workplace deaths, but the other end of the spectrum as well: psychological violence, whether sexual or bullying harassment.

Having made inroads in the study of white-collar crime through the work of Braithwaite, Fisse, and Chappell, Australia nevertheless has a large presence of cross-fertilized corporate and organized crime. Currently, all of Australia's major cities, and some of its smaller towns, host both Anglo-Australian and international gangs and criminal networks involved in bribery, corruption, and violent crime. Interestingly, the only groups visibly absent from the Australian underworld are the Nigerians and the Mexicans. It seems that North Koreans are getting involved in smuggling heroin into Australia, according to the federal police.

Another important concern for the authorities is illegal immigration, primarily from the Middle East and southeast Asia. Recent Australian administrations have taken a hard line toward those it considers to be queue-jumping. As a result, the federal government instituted its Pacific Solution (September 2001), whereby aliens are to be housed in camps on neighboring islands (Nauru and Papua New Guinea) where their claims will be assessed. Most of the illegal attempts to enter Australia by boat come from Indonesia, where local gangs and corrupt authorities have colluded with international smugglers. And, the Australian Immigration Department recently established a task force in order to crack down on its own corrupt agents who have sold visas (refugee and immigration) to the smugglers. Also, there is evidence that agents have colluded with international prostitution rings that have brought women from Asia and eastern Europe into Australia. Organized crime is also attracted to Australia because of its extensive financial services and gaming (primarily) industries which facilitate money-laundering.

Moreover, the country offers a safe environment (despite terrorism alerts) in which to invest in businesses, real estate, and the tourism industry. In the early 2000s, Australia decided to more actively intervene (militarily and diplomatically) in the south Pacific region in order to halt the disintegration of states which benefit from and attract international crime and terrorist networks. Australia must also contend with piracy (Indonesia and South China Sea) and states that sell their sovereignty to money-launderers (Nauru).

## automobile

SOME HISTORIANS argue that the impact of the automobile on the modern industrial age is as deep and broad as the French and Russian Revolutions or that the automobile has more profoundly influenced 20th-century American historical development than presidents or Progressives. Without a doubt, the automobile has radically changed the technological and social development of American and world history.

Henry Ford's mass production of cars marked the beginning of the motor age when the car changed from the toy of the rich to the essential transportation for the ordinary man. Trolley cars were displaced to make room for more cars. Brick streets were covered with asphalt to provide a smoother automobile ride. As more Americans owned cars, urbanization patterns changed and suburbs flourished. The U.S. government created a national highway system, and Americans became mobile, jumping into the car and going anywhere anytime.

The automobile changed social patterns as well. Young people enjoyed the freedom of the automobile and their parents feared that the automobile freed moral standards to an unacceptable level. After a century of using the automobile, the world is still experiencing and assessing the effects of internal combustion transportation. Nearly every aspect of modern life has developed around this technology. Americans are debating its impact on

their physical, political, and moral environments. With the count at 500 million cars and steadily increasing worldwide, and over 150 million cars in the United States, not counting heavy vehicles such as trucks, buses, cranes and other commercial vehicles, people have forged a lasting alliance with the automobile.

Automobile safety versus the corporate bottom line is the most pressing problem that the automobile industry faces as the 21st century progresses. Factors like increasingly high speed limits, more highways and more cars clogging them, and human error and mechanical failures have kept these issues consistently newsworthy, although not necessarily new. The February 21, 1931, issue of *Science News* pointed out that according to a survey by statisticians of the Travelers Insurance Company, more Americans had been killed by automobile accidents than in World War I. During the 18 months that the American Expeditionary Forces had fought in World War I, about 50,510 soldiers had been killed in action or died of wounds. During the equivalent amount of time in 1930–31, 50,900 persons were killed in automobile accidents in the United States. The National Vital Statistics report for the year 2000 stated that 43,354 Americans were killed in motor vehicle crashes that year.

Automobile accidents began as soon as the first cars appeared on America's rutted, dirt roads that had been hewn for horses and foot traffic. A broken arm, acquired when cranking the engine to get it started, was one of the most common Model A and Model T injuries in the 1920s and 1930s. As the automobile industry grew with the decades, so did the technology and the concern for the corporate bottom line, which made the temptation to short-change the automobile consumer irresistible for most automakers. The shift to holding automobile manufacturers accountable for the safety of their vehicles began in the 1960s when lawyer Ralph Nader challenged General Motors in his book *Unsafe at Any Speed*. Although he was young and inexperienced, Nader permanently changed the course of the automobile industry by proving that General Motors automobiles were not as safe as they could be, and revealing that although company executives were aware that consumers were at risk from their unsafe automobiles, they were more concerned with profits than probity. Nader charged that the Chevrolet Corvair exemplified the General Motor's disregard for safety. Small, state-of-the-art, light-

weight, and featuring an independent rear suspension, the Corvair proved to be popular and consumers rushed to buy the 1960 model. When data published by Nader revealed that the design of the Corvair made it unsafe and that hundreds of drivers had been injured in accidents, sales dipped correspondingly and General Motors attempted to discredit Nader. In response, he sued them, and won a \$424,000 settlement, which he used to form a consumer group to monitor General Motors. Besides paying Nader a cash settlement, General Motors admitted its guilt, creating a front-page story for newspapers across the country.

The Chevrolet Corvair was not the only unsafe automobile that companies manufactured and sold to an unwary and inadequately consumer-educated public. Under the chairmanship of Lee Iacocca, the Ford Motor Company rushed the Ford Pinto into the 1971 subcompact market without sufficient testing and safety trials. Iacocca insisted that car production was more important than safety and the 1971 model was designed and built accordingly. Because of design defects, low-speed crashes ruptured the Pinto's fuel system and caused the car to burst into flames. Using death and injury reports of Pinto accidents as a documentary basis, in April 1974, the Center for Auto Safety petitioned the National Highway Traffic Safety Administration (NHTSA) to recall Ford Pintos. The petition floated in limbo in NHTSA offices until rediscovered by 1977 events. In 1977, Mark Dowie of *Mother Jones* magazine, used these documents and Ford Motor Company memos to write an article about the Pinto which proved that Ford had known about the fuel system problem all along, but had concluded that it would be more cost effective to pay death and injury liability claims than to modify the design. As a result of this publicity, in June 1978, Ford recalled 1.5 million Ford Pintos and 30,000 Mercury Bobcat sedan and hatchback models.

In the next three decades, the road to recall continued to be a reluctant, but well-traveled one for the automobile companies. American Motors introduced the Jeep CJ line in the early 1980s and by the time it discontinued the line in January 1986, had accumulated over 570 lawsuits totaling at least \$1 billion dollars. Although General Motors halted production, Jeeps were never recalled and consumer advocate groups charged that, in 1989 alone, more than 200 people had died in Jeep accidents. A National Highway Transportation Safety Board

(NHTSB) study removed the responsibility from the manufacturer to the consumer when it stated that Jeeps were safe if they were driven properly. In 1987, American Motors Company and its Jeep division became subsidiaries of Chrysler, now Daimler-Chrysler. The company continued to sell vehicles under the Jeep name, including the Wrangler and Grand Cherokee, a popular sports utility vehicle; both still posed rollover risks. Another Jeep model, the Wagoneer, which the company stopped producing in the 1980s, is still involved in lawsuits filed by families of people killed in Wagoneer accidents years into the 21st century.

#### FIRESTONE AND FORD

Public Citizen, a national public interest association founded by Nader in 1971, was a prime mover in the Firestone tire defect and Ford Explorer rollover recall cases of the early 2000s. The combination of the Ford Explorer and Bridgestone and Firestone tires with their tendency to separate and cause accidents, turned out to be a lethal for hundreds of people. Internal Ford documents revealed that the Ford Explorer, first offered for sale in March 1990, had a design defect that made it prone to rollovers.

Company engineers recommended changes in the vehicle design, but Ford, which originates the tire specifications for its vehicles, instead merely removed air from the tires and lowered the recommended pressure standards. After about 100 fatalities, Firestone recalled more than 6.5 million tires in 2000. The consequences of the recall continue to reverberate as the first decade of the 21st century progresses. Previously, Firestone and Ford had attempted a cover up in the 1972 recall of the Firestone 500. When the cover up was discovered, Firestone replaced its top management but its reputation and economic status was severely damaged. In the 2000 recall, when confronted with accusations about the performance of its tire Firestone claimed owner abuse: under-inflation, rough usage or improper repair. The Firestone recall is far from over and consumer advocate groups are pushing for increased authority for the NHTSA to monitor automobile manufacturers and enough punitive powers to increase penalties and civil consequences.

People as diverse as Henry Ford and Nader have decisively steered the course of the automobile in society, and its impact on American life and the American consumer. The first decades of the 21st

century will reveal whether or not the automobile consumer will develop an equivalent social and political power.

## **bad checks**

BAD CHECKS REFER TO banking instruments (checks) that are not suitable for payment at the time they are presented to the issuer's bank. There is a presumption by the acceptors of checks that there are sufficient funds available to cover the checks. When the funds are not available to cover the check, the check "bounces." It is declined for payment as the account has insufficient funds (NSF), or the account has been closed. In the computer age, bad checks also include counterfeit checks that are written on nonexistent accounts.

Bounced checks include those written against insufficient funds due to inaccurate accounting by the check writer, as well as those from check writers who knew the funds were not present but still wrote the checks. In most criminal jurisdictions, there is a presumption of inaccurate accounting by the check writer, and the check writer is given a prescribed time period (usually 10 days) to "make the check good" by paying both the face value of the check as well as a processing fee, usually capped by legislation. After the prescribed time period for bounced checks, or for checks written on closed accounts, there is no longer a presumption of inaccurate accounting and the matter accelerates to the threshold of being a criminal act. The recipient of a check in this situation must supply to the police proof of

notification to the check writer (certified mail with signed receipt) of the failure of the check to originally clear, a statement of nonpayment; or in the case of a closed account, proof that the account is closed, usually indicated on the check by the bank that refused to honor the instrument. Criminal prosecution is often deferred if, after being advised of the pending charge(s) by either police or the prosecutor, the check writer pays the face amount of the check, the prescribed processing, and possibly a fee added by the jurisdiction. If payment is not made, criminal charges can proceed forward.

Other examples of bad checks include stolen checks, counterfeit checks, and check-washing. Stolen checks refer to checks that have been stolen from the check-writer (from a mailbox, house, or wallet) and have been presented to others for payment. Due to lax check-acceptance policies in some operations, checks are accepted for payment without verifying that the person writing the check is the person listed on the check. In some cases, the theft of the checks is not realized until the first 10-day letter arrives. Counterfeit checks refer to checks that have been produced by nonlegitimate sources, and are encoded with either real or fictitious account numbers. In this situation, checks with real account numbers are originally honored but then later challenged as fraudulent by the account holder, who then files an affidavit of forgery with both the bank

and the police. Checks encoded with fictitious accounts cannot be honored as there is no account for the funds to be drawn from.

Check-washing refers to a process by which individuals have obtained previously written checks (often from outgoing mail) and use chemical agents to erase some of the written information (payee, dollar amount, or signature) on the check. The altered checks can now be passed, often with the aid of fraudulent identification cards. Annual estimates of loss by check alteration/check washing have been reported as high as \$815 million.

The number of bad checks accepted as payment by business operations can be reduced through the implementation of various secondary internal control policies. These policies include the requirement of valid identification, preferably identification issued by a governmental body; use of a check-validation system (a private service that tracks bad checks), and local registries of formerly received bad checks. Other policies often include: dollar limits, management approval, verification with a local bank branch, and inkless thumbprints.

## **bait-and-switch**

**BAIT-AND-SWITCH** REFERS TO fraudulent advertising committed by retailers to lure potential customers into their place of business. The Federal Trade Commission (FTC) defines bait-and-switch advertising as: "an alluring but insincere offer to sell a product or service the advertiser does not intend or want to sell."

The true intent of the advertising is to steer the consumer to a product other than the one listed in the advertisement, which usually generates a higher

profit margin to the retailer as well as costs the consumer more.

An example of bait-and-switch advertising is: ABC Computers advertises a \$399 complete computer system for sale; upon arrival to the retail location the consumer makes reference to the advertisement; the salesperson attempts to steer the consumer to another product through various methods ("just sold last one; all remaining units are damaged; product has incurred a large number of customer complaints; a leading consumer guide has just published a disparaging review") and refers the consumer to another product. The other product generally will cost more, and incidentally produce more profit to the retailer. In this scenario, it is assumed the retailer had no intent of selling the originally advertised merchandise, only using the lure of the pricing as bait to bring the potential consumer to the store, giving the salesperson an opportunity to convince the consumer she is better off purchasing the newly recommended merchandise.

The bait-and-switch con has historically been identified with certain industries, that is, electronics, automotive dealerships, furniture stores, and similar businesses. In many cases, the originally advertised prices were so low that alert consumers should have been wary of the offers. Both the draw of the incredible prices and the verbal skills of the salesperson are required to successfully complete the bait-and-switch process. If the salesperson is unable to steer the consumer away from the advertised merchandise to the merchandise the retailer desires to sell, then the scam has failed.

Some retail operations employ the use of skills. These are persons posing as other customers to assist in steering the consumer away from the advertised merchandise; through subterfuge such as "returning" their purchase and complaining loudly of their dissatisfaction with the advertised merchandise; or praising the salesperson for advising them of the recommended merchandise (of which they are so satisfied). Some retail operations employ salespersons more for their abilities to steer consumers than for their knowledge of the merchandise or their customer service skills.

Consumers who become aware that a bait-and-switch advertising scheme is being conducted can contact the local state attorney's office or the Federal Trade Commission (FTC), and provide a copy of the advertisement in question, as well as a description of what transpired at the retail operation.

Bait-and-switch schemes can also occur with services, that is, telephone, carpet cleaning, and home repair sales industries and are especially targeted to senior or non-English speaking populations.

## Bakker, Jim and Tammy

JIM BAKKER'S FALL from a man of God to a man of fraud marked one of the largest religious swindles in history. Bakker, born in Muskegon, Michigan, in 1940, sowed his share of wild oats as a youth but eventually settled down to study the ministry. Inspired by an Oral Roberts's revival meeting, Bakker decided to pursue the profitable combination of religion and show business.

In the early 1960s, Bakker, along with his wife Tammy Faye (who was easily recognized by her liberal use of make-up and colorful eye shadow), worked with Pat Robertson on the Christian Broadcasting Network (CBN) and developed a successful children's show.

After an acrimonious break from CBN, the Bakkers partnered with Paul Crouch and the Trinity Broadcasting Network to air a daily talk show hosted by the husband-wife team called "Praise the Lord" (PTL). After a falling-out with Crouch, the Bakkers transformed PTL (now tagged People that Love) into a late-night, talk-show program in 1974. Within two years, the PTL show was being broadcast on 70 commercial stations and 20 cable services, and boasted more than 13 million viewers. The Bakkers also owned a 2,300-acre Christian theme park in Charlotte, North Carolina, that grossed \$130 million annually.

The ministry continued to grow, despite an uncomfortable and often hostile relationship with the

Federal Communications Commission (FCC) over improper financial practices. The first large-scale scandal occurred in 1979 after PTL raised \$350,000 to upgrade its overseas television and diverted the money to pay the Bakkers' personal bills.

The FCC's attempt to prosecute resulted only in administrative sanctions. The Bakkers attracted an even higher level of attention after additional rumors of wrongdoing emerged in 1987. Jim Bakker admitted having a one-night sexual encounter with 21-year-old Jessica Hahn, a former church secretary. Hahn's claim of sexual misconduct resulted in a \$265,000 pay-off and PTL was now dubbed "Pay the Lady."

Tammy Faye Bakker's drug dependency also became public, and meanwhile the Internal Revenue Service (IRS) revoked PTL's tax-exempt status. In the wake of the scandals, Jim Bakker resigned from PTL and was defrocked by the Assemblies of God Church. In 1988, Jim Bakker was charged with diverting millions of dollars from the PTL ministry to his personal use.

As details became public, the sordid particulars of the couple's extravagant lifestyle shocked the religious and secular worlds. The Bakkers' accumulated assets included: a house in Palm Desert, California, valued at \$600,000; a house in Gatlinburg, Tennessee, renovated at a cost of \$340,000; a \$600,000 condominium in Florida with \$60,000 worth of gold fixtures; a \$500,000 house in Palm Springs, California; a collection of Rolex watches; three Mercedes; his and hers Rolls Royces; a \$6,000 playhouse for their children; and an air-conditioned doghouse for Tammy's Saint Bernard dog.

Jim Bakker used his television show and direct-mail advertisements to induce followers to become life-time lodging partners in the Heritage USA theme park. A "gift" of \$1,000, for example, allowed a member to stay free in the Grand Hotel for four days and enjoy a vacation of religious activities. Bakker sold 66,683 fully paid partnerships in the Grand Hotel though he originally had limited the lodging sales to 25,000. The partnership programs for the Grand Hotel ranged from \$500 to \$10,000 and netted approximately \$67 million for the Bakkers.

Over half the money collected for the hotel was used to cover daily operating expenses, including excessive compensation and perks to the Bakkers. Just over half of the monies raised were used for construction and no funds were saved to cover the

*Jim Bakker, founder of the PTL Network, pauses with reflection, during an interview.*

*Tammy Faye Messner (formerly Bakker) poses with her dog, Tuppins III, at a book-signing.*

cost of future life-time lodging. In a similar scheme, almost \$70,000 worth of paid partnerships was sold for the never-built Towers Hotel.

The Bakker scandal represented the largest consumer fraud case ever prosecuted for federal wire- and mail-fraud violations. Prosecutors argued that Jim Bakker had engaged in a massive scheme to oversell life-time partnership packages. A 28-page indictment included eight counts of mail fraud, 15 counts of wire-fraud use of telephone and television, and one count of conspiracy to commit wire and mail fraud with partner, Richard Dortch. The 1989 trial disclosed Jim Bakker had fraudulently raised more than \$158 million from 1984 through 1987. He was convicted on 24 counts of fraud, fined \$500,000, and sentenced to 45 years in prison by a U.S. federal district court judge.

The sentence, labeled as overly harsh, was appealed and reduced to 18 years. The couple divorced in 1992 and Tammy Faye married Jim's best friend. Bakker was released from prison to a halfway house in 1994. As a result of the Bakker scandal, the National Religious Broadcasters established a new code of ethics that defined proper moral and financial standards for television ministers.

## Banco Ambrosiano

IN 1982, Banco Ambrosiano, then Italy's largest private bank, collapsed with estimated debts of \$1.3 billion. Ambrosiano had come close to collapsing in May 1981 when the bank's president, Roberto Calvi, was convicted of illegally exporting billions of lire and was sentenced to four years' imprisonment.

Calvi was bailed-out pending an appeal after spending a short time in jail. When it was revealed that Calvi was a member of the P2 masonic lodge, press speculation further undermined confidence in Ambrosiano.

The Vatican, which owned a large number of shares in Ambrosiano, took the unprecedented step

of issuing letters reassuring creditors that the Vatican would assume the bank's liabilities. However, the letters did not halt the official investigation of Ambrosiano's affairs. In June 1982, the Italian Treasury dissolved the bank's administration and made the Bank of Italy a temporary commissioner when the investigators discovered a \$1.3 billion "hole" in Ambrosiano's accounts. Further investigation revealed that Calvi had worked closely with Archbishop Paul Casimir Marcinkus, head of the Institute of Religious Works, known by its Italian initials IOR, to channel Vatican funds into a network of secret offshore accounts, creating a Bahamian subsidiary of Banco Ambrosiano and a series of Vatican-owned shell companies in Nicaragua, Panama, and Peru.

Ambrosiano booked loans of millions of dollars to these dummy companies. With or without the Vatican's blessing, Calvi used the shell companies to make other investments such as buying control of Banco Ambrosiano and the Rizzoli media empire. The "hole" in the accounts came about when these investments collapsed, wiping out the loans along with interest charges. Calvi fled Italy when the Italian authorities discovered the extent of the bank's losses. Several days later, his dead body was found hanging under London's Blackfriars Bridge with 11 pounds of bricks and \$15,000 in his pockets. His secretary had killed herself the day before.

Calvi's death, the death of his secretary, and the refusal of the Vatican to cooperate with the Italian authorities prevented investigators from fully unravelling Ambrosiano's financial network. Although the investigation revealed that the IOR held a controlling interest in the bank, the Vatican denied legal responsibility for the collapse of Ambrosiano arguing that the shell companies were nominally owned by the IOR. However, the Vatican admitted "moral involvement" in the collapse and paid \$241 million to Ambrosiano's creditors in 1984.

The collapse of the bank and the circumstances surrounding Calvi's death continue to puzzle British and Italian police. An inquest in London recorded a suicide in July 1982, but a second inquest in July 1983 delivered an open conclusion, while a civil court in Milan concluded that Calvi was murdered.

In 1997, Italian prosecutors began to investigate Calvi's death once more. In July 2003, the pros-

ecutors concluded that the Mafia murdered Calvi to punish him for misappropriating Mafia funds and to prevent him from blackmailing powerful figures in Italian society. The prosecutors went on to name four people suspected of murdering Calvi. Two months later, the City of London Police announced that they had reopened the investigation into Calvi's death.

## bank fraud

**BANK FRAUD IS A SPECIALIZED** type of criminal deception that involves customers, employees of the bank, or others who knowingly execute, or attempt execute a scheme to obtain money, funds, credits, assets, securities, or other property owned by, or under the custody or control of, a federally chartered or insured financial institution by means of false or fraudulent pretenses, representations, or promises.

A federally chartered or insured financial institution is a bank with deposits insured by the Federal Deposit Insurance Corporation (FDIC), or a credit union with accounts insured by the National Credit Union Administration Board, or a federal home loan bank.

On October 12, 1984, President Ronald Reagan signed into law the Comprehensive Crime Control Act of 1984. It was designed to fill an obvious gap in the federal criminal laws by enacting the first true federal bank fraud statute. The enactment of Sec-

tion 1344 of the law was the product of growing concern over the inability of federal prosecutors to reach sophisticated financial criminals with antiquated statutes, many of which were enacted more than 50 years ago. Congressional concern over this problem was fueled by the bank failures of the early 1980s, and claims by prosecutors that several Supreme Court decisions interpreting federal criminal laws have hampered prosecutions.

The absence of a federal statute applicable to certain types of fraudulent activities does not mean that those activities will escape prosecution; state laws prohibit virtually all kinds of financial fraud. The superior resources of federal prosecutors, and the arguably greater federal interest in federally insured financial institutions has, however, traditionally meant that federal prosecutors pursue these offenses.

Prosecutors have complained in particular about Supreme Court decisions limiting the reach of those federal criminal statutes that prohibit mail fraud and the making of false statements to banks. The false statement statute (Section 1014) has historically been utilized by the Justice Department to prosecute check-kiting and other similar schemes designed to induce the advancing of money or credit based on a check known by the customer to be drawn on insufficient funds. The government's theory was that the check was implicitly a statement to the bank that there were sufficient funds on deposit to cover the check and that the statement was false. This theory of prosecution was foreclosed, however, by the Supreme Court's 1982 decision in *Williams v. United States*, which held that check-kiting, or deliberately drawing a check on insufficient funds, is not a violation of Section 1014 because the check is not a statement but merely an order to pay funds. The impact of *Williams* was to terminate a number of federal criminal investigations. The new bank fraud statute may permit federal prosecution of many of these acts, especially those involving check-kiting.

Bank frauds have also traditionally been prosecuted as violations of the federal mail fraud or wire fraud statutes when the prosecutors could prove that the federal mail or wire communications were used to execute the fraudulent scheme. Federal jurisdiction over the crime is predicated on the use of the mail or wire communications. This approach has been restricted by the Supreme Court's decisions in *United States v. Maze*, which held that the

mail fraud statute must be construed to apply only where the mail is used for the purpose of executing the scheme or artifice to defraud, and is not applicable to every case where the mail is utilized at some point in the scheme. Another problem for prosecutors is that the rise of private courier services means that businesses are making less use of the mails and wires, further reducing the use of these statutes.

These developments, coupled with the perception that financial fraud had become too sophisticated for the then-existing statutes prohibiting it, convinced Congress to address the problem directly and enact a specific bank fraud statute that would allow the government to prosecute a much broader spectrum of bank fraud. Although the decision to enact a comprehensive bank fraud statute has significant federal implication, because it shifts the primary law enforcement role for bank fraud from the states to the federal government, this issue has received very little attention.

#### COST AND FORMS OF BANK FRAUD

How significant are bank losses due to fraud? Fraud losses in the financial industry are difficult to determine. Although estimates of fraud committed by bank officials in the United States may be unreliable, some analysts suggest the loss of savings and loan fraud perpetrated during the 1980s and 1990s alone cost tax payers over \$1 trillion.

For the period of April 1, 1996 through September 30, 2002, the Federal Bureau of Investigation (FBI) received 207,051 Suspicious Activity Reports (SARs) for criminal activity related to bank fraud: check fraud, check-kiting, counterfeit checks, and counterfeit negotiable instruments. These fraudulent activities accounted for 47 percent of the 436,655 SARs filed by U.S. financial institutions (excluding Bank Secrecy Act violations), and equaled approximately \$7 billion in losses.

Bank fraud takes many forms. In most instances, bank fraud involves small amounts of money and a relatively simple transaction. The most common bank fraud committed by outsiders is check fraud. Check fraud is the forgery, alteration, counterfeiting, or knowing issuance of a check on an account that has been closed or has insufficient funds to cover the amount for which the check was written.

Closed-account fraud relies upon the time that it takes a bank transaction to be processed or "float

time.” The float time offers a window of opportunity for the criminal to defraud the financial institution. An act similar to closed-account fraud is check-kiting. Check kiting requires multiple bank accounts and the movement of fictitious funds between those multiple bank accounts. Like closed-account fraud, the check-kiter also takes advantage of the time necessary for a bank transaction to be processed in order to create fraudulent balances. A check-kiter will deposit a check drawn on one bank into a second bank without having adequate funds in the first account to cover the check. When the deposit is made, the second bank grants the depositor credit, allowing the customer to draw checks against funds not yet collected by the bank. The check-kiter then writes a check on the second bank and deposits into the first bank to cover the original check. The perpetrator’s plan is to continue writing checks between accounts to cover insufficient funds.

Another relatively simple type of fraud involves opening a new bank account using false identification. After depositing altered or counterfeited checks into the account, the offender then makes withdrawals for a large portion of the account balance before the bank realizes it has been victimized.

The process of altering a check is another form of check fraud. Chemical modification to checks or check-washing is one of the most popular forms of alteration. Check-washers use acid-based household chemical solutions to alter or erase particular pieces of information on the checks, such as payee name and payment amount. Check-washers may then add new information to the checks using a typewriter, laser printer, or other means to make the checks payable to themselves or to co-conspirators while also increasing the amount payable.

## BANK INSIDER FRAUD

Insider abuse often involves defrauding the bank, and is a technical term that refers to a wide range of misconduct by officers, directors, and insiders of financial institutions committed with the intent to enrich themselves without regard for the safety and soundness of the institution they control, in violation of civil banking laws and regulations and, perhaps, also in violation of criminal banking laws. The term *criminal misconduct* refers strictly to criminal acts committed by such insiders against the institutions they control. Thus, insider abuse does not

necessarily involve criminal misconduct. However, there is usually a very thin line between insider abuse and bank fraud. The difference between fraud, which is illegal, and abuse, which is legal but not good, is a matter of interpretation. It is up to a jury to decide which side of the line the accused is on; and the so-called bad guys frequently get off, despite the best efforts of the FBI, regulators, and others. Equally important, insider abuse and fraud lead to unsafe or unsound banking practices, such as extending credit that is inadequately secured, failing to maintain internal controls, and paying excessive cash dividends.

Self-dealing is a common form of insider abuse. It refers to insiders putting their own self-interest above the interest of the bank. One form of self-dealing is when an insider uses her authority to grant loans to herself, or a related business, at preferential terms or using lower credit standards, with the intent of making profit in that business. For example, banking regulators sued the National Bank of Georgia, Calhoun First National Bank, and T. Bertram (Bert) Lance, an insider, for engaging in certain unsafe and unsound banking practices that violated federal securities laws.

Lance was the former Jimmy Carter administration budget director who resigned that post because of his banking practices. The complaint alleged that credit (loans and overdrafts) was extended to Lance, his relatives, and his friends on preferential terms and without regard to their creditworthiness. The extension of the credits caused liquidity problems at Calhoun bank.

To solve the problems, Calhoun bank transferred troubled loans to other banks, but Calhoun bank concealed the transfers by making misleading entries in its books. The loans were not reflected on Calhoun’s financial statements, and no adjustment was made to the provision for loan losses for some of the transactions. The result was that earnings and assets were overstated, and the bank failed to disclose its true financial state to banking regulators and investors.

Bank failures of the late 1980s and early 1990s resulted from bank fraud in large commercial and real-estate transactions, and they frequently involved insider participation. The five most common types of schemes that result in major frauds include: nominee loans, double-pledging of collateral, reciprocal loan arrangements, land flips, and linked financing.

One form of bank fraud can include identity theft to gain access to bank funds with false identification.

*Nominee loans.* These are loans obtained by one person on behalf of another undisclosed person. The nominee, or “straw borrower,” may have no involvement in the loan transaction other than to obtain the funds and pass them on to someone else who does not want their own identity known.

*Double-pledging of collateral.* The same collateral is used at two or more financial institutions to obtain loans. The lenders are unaware that the collateral is pledged on another loan. The combined amount of the loans exceeds the value of the collateral.

*Reciprocal loan arrangements.* These are loans made between insiders in different financial institutions that lend funds to each other. A variant of this device is to sell loans to other institutions with the agreement to buy loans from that institution. The purpose of such agreements is to conceal the loans or sales from bank examiners.

*Land flips.* This refers to the transfer of land between related parties in order to fraudulently inflate the value of the underlying property. The land with the inflated values is used as collateral for loans. The amount of the loans frequently exceeds the actual value of the underlying property.

*Linked financing.* Large amounts of funds are deposited in a financial institution, using brokered deposits or some other means, with the understanding that the institution will make a loan conditioned on the deposit. The loans may be used to finance land flips or other types of deals.

Some of these schemes, such as linked financing and land flips, are not necessarily illegal by themselves. However, they usually occur in connection with willful misapplication of funds, making false statements, willfully overvaluing property, and other illegal activities.

Although these types of transactions are presented separately, they often occur in combination. For example, large-scale fraud involving real estate requires two misrepresentations. The first essential misrepresentation is that the value of the property is inflated. The second misrepresentation concerns the creditworthiness of borrowers. The crooks misrepresent their own creditworthiness, the creditworthiness of the buyers they control, and the value of the properties by using false income-tax returns and false financial statements. Property values are usually inflated by using a “double escrow” or a “straw buyer.”

In a double escrow, the same property is sold simultaneously to two separate parties controlled by the perpetrator. The first transaction is from a legitimate seller at a fair market price to a buyer who is controlled by the perpetrator. The second sale is from the first buyer to the second, both of whom are controlled by the perpetrator. The second sale is made at two or three times the fair market price. In some cases the value is inflated as much as 20-fold by using improper appraisals. This type of operation is also used in connection with a land flip. If a straw buyer is used, the straw buyer buys the property from the legitimate seller at the fair market price. Then the property is sold again, but at a higher price to a buyer who will qualify for a loan on the property at an inflated value.

To obtain inflated appraised property values, the perpetrators hire real estate appraisers from distant locations who want to increase their fee income, or who may also be criminals. The appraisers, who are not familiar with the property, are provided with false information about the comparable worth of properties in the area. To illustrate this process, one bank loaned over \$54 million on an office complex and relied on a borrower-ordered appraisal. The appraisal did not consider that more than one-

half of the rentable space was leased at rates that were 50 percent below the current market prices, or that occupancy levels were low in nearby comparable properties due to overbuilding. The result of such actions is faulty and inflated appraised values.

Then “loan packages,” including financial statements, appraisals, and other information are presented to prospective buyers by “loan brokers” or others pretending to be independent and objective third parties. The buyers of the overvalued real estate are individuals, limited partnerships, or financial institutions that rely on the honesty and thoroughness of the independent and objective third parties. Rarely do buyers do their own credit analysis or appraisals, especially if the property is at a distant location.

#### NEW FRAUD OPPORTUNITIES

As computers proliferate at work and home, there are more opportunities for criminals to use computers to facilitate check and credit-card fraud. The use of relatively inexpensive computers, scanners, and printers, with capabilities often referred to as desktop publishing, has enhanced the ability of criminals to manufacture their own brand of counterfeit checks. Computers loaded with sophisticated graphics capabilities can be purchased from most computer and office-supply stores. Counterfeiters, with the aid of computers, can duplicate corporate and payroll checks, travelers’ checks, credit cards, certified bank checks, money orders, currency, and other negotiable instruments, as well as personal identification such as drivers’ licenses and social security cards.

According to the American Bankers Association, the most common type of check fraud in 1999 was forgery. More than one-third of fraud cases and fraud losses were attributed to forgery. According to a study conducted by Ernst & Young, 500 million checks are forged annually in the United States, resulting in losses of \$10 billion.

The burgeoning use of the internet and advanced technology, coupled with increased investment and expansion, has intensified competition within the financial sector. With lower costs of information-processing, legitimate companies have found it profitable to specialize in data-mining, data-warehousing, and information brokerage. This wealth of available personal information creates a target-rich environment for today’s sophisticated

criminals, many of whom are organized and operate across international borders.

Simply stated, identity crime is the theft or misuse of an individual’s personal or financial identifiers in order to gain something of value or to facilitate other criminal activity. Types of identity crime often involve financial loss to a bank. Identity crimes are often associated with other crimes such as narcotics, organized crime, mail fraud, money laundering, immigration fraud, and terrorism.

#### MONEY LAUNDERING

In addition to identity theft, improved technology has benefited criminals attempting to defraud banks through money-laundering. Money-laundering is a frequently used criminal scheme in which illicit cash is introduced into financial systems by usurping bank-reporting requirements. The U.S. Treasury Department views money-laundering as the cornerstone of financial operations among international

*Five hundred million checks are forged annually in the United States resulting in losses of \$10 billion.*

organized crime groups. Because most criminal income is in the form of cash, these profits are unusable in a contemporary, cashless banking system. Criminal organizations move their cash profits through financial institutions to legitimize the money and provide them access to the funds. Money-laundering is classified as a type of banking fraud because launderers not only avoid bank reporting regulations but, by using deceit, also fraudulently convert illicit cash profits into legitimate assets. Their goals are to subvert bank-reporting procedures, disguise the source of the assets, and introduce the cash into cashless banking channels.

There are several methods of introducing the illicit cash into legitimate financial circles. There are four common money-laundering techniques: bank methods, smurfing, currency exchanges, and double-invoicing.

Bank methods include various exchange transactions in which cash is converted by currency trading, exchange for treasury bills, bank drafts, letters of credit, travelers' checks, cashiers' checks, bank wire transfers, or other noncash monetary instruments. This conversion method is effective if the launderer is able to change cash into any noncash financial instrument which can be used in deposit or spending transactions.

Smurfing is a process of making numerous cash deposits into several bank accounts. This laundering tactic depends on depositing quantities of cash just under the minimum amount banks are required to report to the Treasury Department. By making deposits into numerous bank accounts in a short period of time, smurfing techniques launder a significant amount of cash without being detected by bank transaction reporting.

To avoid traditional financial institutions, money launderers often use currency exchanges to convert U.S. cash into foreign currency, which is later processed through banks. This ploy establishes a false corporation to receive the converted cash in foreign jurisdictions. Once the cash is converted into foreign currency, it can be introduced into legitimate banking channels and utilized by the money launderer.

In another strategy, double-invoicing disguises financial gains by invoicing a domestic or foreign commercial subsidiary at an inflated price for merchandise and depositing the profits. Thus, the source of the funds is hidden by manipulating the documentation of business income.

In addition to these four laundering methods, criminal organizations purchase and operate their own banks to mask money-laundering activities by failing to comply with bank transaction reporting laws. This is the most difficult money-laundering method to detect.

Lastly, perhaps the most unsophisticated, yet effective, money-laundering method is to transport physically large quantities of cash outside of the United States to deposit in foreign bank accounts, in violation of U.S. currency reporting laws. According to U.S. Treasury estimates, these laundering techniques are responsible for \$100 billion in U.S. illegal drug profits passing through financial institutions.

Since the 1992 peak of the savings and loan crisis, the FBI has been able to refocus its investigative efforts from failed financial institution cases to other high-priority cases. At the close of fiscal year 2002, the total number of pending financial institution investigations in the FBI was 7,305. Of this total, 71 failure cases, or less than 1 percent, involved criminal activity related to a financial institution. This statistic reflects a 91 percent reduction in failure investigations since the July 1992 peak of 758 cases.

However, as the number of failure investigations has declined, the number of major financial institution fraud investigations has remained substantial. Since then, external fraud schemes have replaced insider abuse as the dominant financial institution fraud problem confronting financial institutions. In many instances, the international aspects associated with many of these schemes have increased the complexity and severity of the fraud being committed.

## Bank of Credit and Commerce International

ON JULY 5, 1991, the Bank of England and Luxembourg and Cayman Islands authorities froze the deposits of the Bank of Credit and Commerce International (BCCI) and closed its branches. BCCI had offices in 70 countries and 14,000 employees. More important, the bank had a negative value of £7 billion and estimated losses of £12 billion. Founded in 1972 by the Pakistani banker Agha Hasan Abedi, BCCI had been mired in scandal since a U.S. federal grand jury in Tampa, Florida, on October 4, 1988, indicted the bank and 10 bank executives for laundering drug money. Pundits began to call BCCI the Bank of Cocaine and Criminals International.

The investigations leading to the court case prompted the Bank of England and other interested national banking authorities to form a college of regulators to monitor BCCI in May 1988. However, it took three years and two months for the Bank of England and other interested parties to decide to close the bank. The Bank of England's tardy response to this and other indications of fraudulent activity at BCCI was heavily criticized by an official inquiry in Britain under the chairmanship of Lord Chief Justice Bingham, and a subcommittee of the U.S. Senate Committee on Foreign Relations under the chairmanship of Senator John Kerry (D-MA). In 2001, the UK House of Lords took the unprecedented step of granting BCCI's creditors to sue the Bank of England for willful misconduct.

Abedi formed BCCI in 1972 with the relatively small amount of capital of \$2.5 million. The Bank of America had a 25 percent stake in the new bank, which was incorporated in Luxembourg. Offices were also opened in UK, Oman, and the United

Arab Emirates. London was, however, the *de facto* headquarters of BCCI. In public, Abedi's stated aim was to create "a world bank, a global bank for the Third World." BCCI made a series of vast loans to a small number of respectable and powerful Middle Eastern and Pakistani businessmen and leaders, including the ruler of Abu Dhabi, and president of the United Arab Emirates Zayed bin Sultan al-Nahyan.

These loans worried the Bank of America and were perhaps the downfall of BCCI. During the 1970s, the bank made a series of enormous loans to the Gulf Group, a shipping firm controlled by the Gokal family. When Gulf appeared close to bankruptcy in 1980, BCCI poured more money into the firm to keep it afloat and disguise the bank's exposure from regulatory authorities who might close it down. Other bad loans and attempts to expand the bank's operations into North America added to the bank's woes. Throughout the 1980s, bank executives plundered accounts to conceal massive losses. The bank also sought new customers to balance the books. In 1983, BCCI bought a Colombian bank with branches in Medellin and Cali.

The authorities received several warnings of the fraudulent activities of the bank. In 1975, U.S. authorities stopped BCCI from taking over two New York banks. Two years later, U.S. authorities blocked another attempt to acquire a U.S. bank, Financial General Bankshares. In 1985, the Bank of England received an anonymous letter alerting them to the bank fraud. In 1988, BCCI was indicted for money-laundering in Florida.

In 1990, Price Waterhouse, BCCI's sole auditor since 1988, published two reports indicating large-scale fraud at the bank. The Bank of England admitted receiving the first indication of fraudulent activity at BCCI in January 1991. The spectacular failure of the Bank of England to supervise BCCI has prompted conspiracy theorists to speculate that the British intelligence community used BCCI to channel funds to agents and gather intelligence on drug barons and terrorists.

## Bank Secrecy Act

THE BANK SECRECY ACT (BSA, Public Law 91-508), signed by President Richard Nixon in 1970, was formulated in order to detect illegal activities by tracking suspicious financial transactions. Also known as the Currency and Foreign Transactions Reporting Act, the BSA is a major crime-fighting tool used by different U.S. government agencies, including the Internal Revenue Service (IRS) and the Federal Bureau of Investigation (FBI).

Since the enactment of the BSA, it has been amended multiple times. These substantial modifications to the BSA include the Anti-Drug Abuse Act of 1986, which contained the Money Laundering Control Act of 1986, and the Money Laundering Suppression Act of 1994. These acts enhanced the enforcement effectiveness of the law by making money-laundering a criminal activity, requiring researchers to develop more successful examination methods, and calling for more examiner training in order to better identify suspicious schemes at financial institutions.

In its current form, the BSA requires that all financial institutions comply with certain provisions and that banking officials formulate internal compliance programs in order to do so. In its simplest form, an internal compliance program must be written, approved by the directors, and include a structure of internal controls to guarantee compliance with the BSA, external or internal auditing of the institution's compliance, daily supervision by a specified person, and training for the money-tracking personnel. The internal controls are required by the BSA to be comprehensive and effective. They

must detail the monitoring of opening and closing accounts and transactions-reporting procedures. Senior management at a financial institution must be updated regularly with compliance and audit reports in order to ensure their knowledge of compliance. Also, the BSA must be an integral factor of a job offer's description and it has to be one of the conditions of employment.

Testing by external or internal auditors is an essential check to ensure that there are no lapses in compliance. Auditors are required by the BSA to monitor a financial institution's internal compliance program and evaluate the employee's knowledge concerning BSA requirements, the quality of the BSA training program, and observe the bank's ability to identify suspicious activity.

The designation of a compliance officer and the establishment and maintenance of a BSA training program are two other components of an internal compliance program. A qualified employee directly employed by the financial institution is required to oversee all the components of the BSA internal compliance program, including the training program. Training must involve all relevant banking personnel, whether an employee is a bank teller or a bank president. It is essential that the training program be updated often to address new bank-crime schemes and new regulations.

According to the BSA, there are five reporting requirements with which banks must comply. These reports include an IRS form detailing any transaction amounting to over \$10,000, a U.S. Customs form for anyone who transports, mails, or receives foreign currency over \$10,000, and a Department of Treasury form with a list of a customer's foreign accounts that exceed \$10,000. The Suspicious Activity Report (SAR) is another form, which must be submitted to the Department of Treasury that details any transaction, which is deemed to be suspicious. Also, an exemption report must be filed every other year in order to gain authorization for an exempt customer.

Guidelines are set for record-keeping as well. Banks must keep records of each transaction between \$3,000, \$10,000, and higher, along with identity verification of the customer. Also, records of fund transfers between banks of any amount above \$3,000 must be kept and reported.

To help overcome these bookkeeping tasks, a number of computer programs were created, including the Currency Reporting System, which

records data and automatically produces the necessary IRS forms, and the Wire Transfer Control System, which is able to interface with other federal bank programs and generate the reports required by the Department of Treasury.

Enforcement of the BSA really depends upon bank employees' ability to recognize and report suspicious activities and illegal conduct. BSA training guides stipulate numerous signals of foul play. For example, suspicious activities include opening several accounts and constantly transferring substantial amounts of money; frequent, large transactions in cash; complete repayment of a loan with no explanation as to the source of the repaid money; large wire transfers from foreigners; frequent exchanges of small bills for large bills in substantial amounts; and the purchase of cashier's checks or money orders with large amounts of cash. Consequently, the BSA requires that banking officials work closely with federal investigations and daily confront problems like drug-trafficking and money-laundering.

## Banker's Trust

EMPLOYEES OF Banker's Trust Company took advantage of derivatives trading to steal from such customers as multinational consumer goods firm Procter & Gamble, and greeting card company Gibson Greetings from 1991 to 1994.

The situation led to reforms in the derivatives market and, by forcing Banker's Trust to reorient its business away from derivatives trading, contributed to its takeover by Deutsche Bank. Derivatives are a

family of complicated transactions used either to hedge the risk of a financial market or index, or to speculate upon it. As such, the transactions involve a high degree of risk and provide salespeople with high profits.

Banker's Trust employees did not fully explain derivatives to their customers. Bank employees concentrated primarily on the New York interest rate desk and the New York corporate desk exploited weaknesses in the derivatives business for their own purposes.

In one case, a trader used his facility with mathematics to develop a formula for a leveraged derivative product that concealed the amount of leverage embedded in the product. Attempts by the bank's internal control departments to enforce appropriate standards, such as determining if a transaction was suitable for a customer, were suppressed by senior management. The bank executives, including chairman Charles S. Sanford, Jr., proved more interested in marketing lucrative derivatives than in protecting the financial well-being of its clients.

When exposed, Banker's Trust fired the guilty employees who still remained with the firm. It settled lawsuits with its defrauded customers and four regulatory agencies. These agencies, the Commodity Futures Trading Commission, Federal Reserve, New York State Banking Department, and the Securities and Exchange Commission, subsequently issued a report recommending changes in the derivatives business.

Many of the recommendations have become standard operating procedure in the industry, including the practice of keeping written policy manuals and requiring that non-English speaking customers receive adequate disclosure of the terms and risks of derivatives in a language that they can clearly understand. The agencies also acknowledged that Banker's Trust Company had not made any institutional effort to defraud, mislead, or take advantage of its banking customers and that many of its employees had acted properly.

## bankruptcy fraud

BANKRUPTCY REFERS to the act of declaring one is incapable of paying debts. The laws relating to bankruptcy were designed to protect both individuals and corporations in the event that a financial disaster were to strike; more specifically, the laws were developed to prevent people and companies from losing all of their property. Occasionally, however, a debtor will fraudulently claim bankruptcy. The debtor may attempt to conceal her assets, she may lie about debt, or she may file multiple claims of bankruptcy in an attempt to defraud creditors.

Historically, the filing of a claim of bankruptcy imparted a sense of failure on the part of the debtor. However, as the procedure has become more established in society there has been a 500 percent increase in bankruptcy filings. Of this number, 10 percent involve fraudulent claims. There are four commonly encountered fraud schemes: concealment of assets fraud, petition mills, multiple filing schemes, and bust-out schemes.

### CONCEALMENT OF ASSETS FRAUD

When a debtor files for bankruptcy he is required to list all assets so that creditors will have the opportunity to claim a share of the earnings from the sale of these assets. However, under this form of fraud, the debtor will intentionally neglect to list all assets. The criminal belief is that creditors cannot obtain payment from the sale of assets that are not known.

There are several variations of this scheme. In one variation, the debtor will transfer the assets she wishes to keep to the name and financial accounts of a family member who has good credit. Another variation involves the debtor hiding cash assets in accounts overseas and outside the legal jurisdiction of U.S.-based creditors.

Concealment of assets is the most commonly encountered form of bankruptcy fraud, with over

two-thirds of all fraudulent bankruptcy cases invoking variants of the scheme.

### PETITION MILLS

Petition mills take advantage of poor debtors who wish to save their homes. Under this form of fraud, a tenant will be contacted by an agency offering to work with the debtor's landlord to prevent eviction. The debtor then agrees to pay the agency for their services. Many times these agencies have no intention of contacting the landlord. Instead, the agency will take the personal information collected from the debtor and file bankruptcy without the tenants' knowledge. The tenant continues paying the agency, while the agency will extend the eviction process out over several months. By the time the tenant realizes that he has been duped, his credit has been destroyed, his bank account has been drained, and his home has been taken. These operations are seeing increased use in larger metropolitan and urban neighborhoods where the population consists of large numbers of poor people. Some petition mills operations also operate under the guise of credit-counseling services. The activities are similar, only the pretense changes.

Debtors are still charged for the services of the credit counselor who is filing bankruptcy in the debtor's name without permission, instead of working with creditors. In the end, when the scheme is discovered, the debtors will find that counselors have made their credit record worse, and that they have lost the money spent on counseling.

### MULTIPLE FILINGS SCHEMES

These operations work in much the same manner as the concealment of assets frauds. In both instances, the debtor declines to list all of her assets when she files for bankruptcy. Unlike concealment of assets, these operations are repeated multiple times in separate states. Individuals who engage in this form of fraud will travel from state to state filing bankruptcy claims in each state.

Many times the debtor will use her own personal identifying information, including: social security number, birth date, and name. However, when this information becomes unusable, the debtor will move to the use of illegally obtained information. By combining fraudulent bankruptcy skills with the skills of an identity thief, the debtor

can move from state to state filing bankruptcy claims in the names of unknowing victims.

### BUST OUT SCHEMES

Bust out schemes have long been a problem but have only recently been classified by many scholars as bankruptcy fraud. Historically, individuals who engaged in this type of activity were labeled as careless but not criminal; today, the same cannot be said. When an individual is engaged in a bust out scheme, he or she will apply for as much credit as possible and then fail to pay on any of the accounts. Once the debtor has maximized the number of credit accounts that can be offered, then he will file the bankruptcy claim with no intention of ever paying back the goods. Often, these activities involve buying luxury items that may not be reclaimed by creditors during the bankruptcy proceedings.

One of the most famous incidents of bankruptcy fraud involves the activities of Robert Brennan. Brennan was suspected of numerous financial crimes but was eventually convicted of bankruptcy fraud. During the mid-1990s, Brennan became involved in a scheme where it became apparent that he was going to owe the Securities and Exchange Commission (SEC) approximately \$75,000,000. To avoid losing everything, Brennan secured a large amount of liquid assets, including several million dollars worth of New York state bearer bonds and several hundred thousands of dollars worth of casino chips from the Mirage Casino. Eventually, investigators were able to track down Brennan's accounts and he was charged and convicted of bankruptcy fraud.

In response to the growing problem of bankruptcy fraud, numerous federal law enforcement agencies including the U.S. Secret Service, the Federal Bureau of Investigation, the United States Postal Inspection Service, and the Internal Revenue Service, have joined forces to begin actively prosecuting those who attempt to defraud creditors through bankruptcy fraud. Individuals who are found guilty of bankruptcy fraud may be sentenced to a fine of up to \$250,000 and a prison sentence of up to 5 years.

Individuals are also no longer the only ones being investigated by federal law enforcement. Corporations are now frequently investigated for their role in fraudulent bankruptcy-related activity. The emphasis on bankruptcy fraud has moved from a

reactive nature to that of a proactive nature. Several cooperative efforts among the various law enforcement agencies have resulted in large scale sting operations designed to deter others from committing bankruptcy fraud.

After all, one of the more commonly cited assumptions in handling white-collar crime investigations is the fact that the individuals committing the crime are more deliberate and are therefore more likely to be deterred by prosecution of others who are committing similar criminal acts. Whether this statement is true remains to be seen; however, reactive strategies have not worked and so there would appear to be little harm in subscribing to such a proactive strategy.

Another modification in the response to bankruptcy fraud is the focus on prosecuting accountants and other professionals in the financial industry. The theory being that these are the individuals who are responsible for large-scale increases in fraudulent bankruptcy claims. Individuals may not be familiar with how bankruptcy operates, but accountants and financial advisers who engage in bankruptcy fraud can encourage criminal activity. There are a large number of individuals who may file bankruptcy, but the number of these "one-timers" is far outweighed by the number of fraudulent claims that can come from bankruptcy fraud professionals.

## Barings Bank

ON SUNDAY, February 26, 1995, the banking world was stunned by the announcement that Barings Bank, Britain's oldest merchant bank, had collapsed. Barings owed £827 million on financial

derivatives contracts, but the bank's entire assets amounted to little over £540 million. Barings' exclusive clientele, which included the British Royal Family, stood to lose all the money they had invested in the bank. The fact that one trader at Barings' Singapore office had accumulated the losses revealed the bank's lack of effective internal controls, and undermined confidence in the "gentlemanly" capitalism practiced by traditional merchant banks.

### BARINGS HISTORY

Founded by Sir Francis Baring in 1762, Barings Bank was Britain's oldest merchant bank and had financed the Napoleonic Wars, the Louisiana Purchase, and the construction of the Erie Canal; managed French reparations after Napoleon's defeat at Waterloo; acted as agents for Imperial Russia and the U.S. federal government; and issued bonds for the Chinese and Japanese governments. In 1890, Barings Bank narrowly avoided collapse due to over-exposure in Latin America. The bank was less fortunate in 1995 when it found itself in a similar position in the Far East.

During the late 1980s and early 1990s, Barings expanded its brokering operations in Asia, particularly in Singapore. In 1987, Barings Securities Limited (BSL), the brokering arm of Barings, established Baring Securities Singapore Limited (BSS), opening an office in Singapore. Initially, BSS focused on trading in equities, but its volume of futures trading on the Singapore International Monetary Exchange (SIMEX) grew quickly. As BSS did not have a seat on the exchange, the firm had to pay commissions on its transactions. A decision was made to cut out the middle-man, buy a seat on the exchange, and hire futures traders. Senior managers authorized the futures traders to carry out futures and options transactions on behalf of clients, or the Barings group, and trade in Nikkei-225 futures contracts listed on the Osaka Securities Exchanges (OSE) and SIMEX, in order to profit by small differences in the price of futures on the exchanges.

### ROGUE TRADER

In 1992, BSS appointed Nick Leeson general manager of the new futures operation, granting him the authority to hire trading (front office) and settlements (back office) staff. Leeson had no experience in trading prior to his new appointment. His inex-

perience was deemed unimportant as the general manager's job did not involve direct trading. However, Leeson decided to take the necessary exams to qualify as a trader. Once Leeson passed his exams, he combined the roles of general manager and head trader. He was also *de facto* head of settlements as his inexperienced back office staff deferred to his greater back office experience. Assuming these three roles allowed Leeson to circumvent Barings' internal controls, as he could initiate a transaction and determine how it was recorded and settled.

In July 1992, Leeson used his control of front and back offices to open Error Account 88888. This was the account that he used to conceal trading losses and exaggerate his earnings, thus boosting his bonus. In his autobiography, Leeson claims that he used the account to hide embarrassing mistakes made by his inexperienced staff. However, Leeson was soon using the account to conceal his massive losses on unauthorized trading in Nikkei futures. At the end of 1992, the account showed a loss of £2 million increasing to £23 million at the end of 1993. Leeson's losses grew massively in 1994. Shortly before the Kobe, Japan, earthquake on January 17, 1994, Leeson sold put options (right to buy) and call options (right to sell) on the Nikkei simultaneously. The Nikkei fell slightly after the earthquake and Leeson panicked. He bought a vast amount of Nikkei futures in a vain attempt to stop the index from falling, further racking up the losses that broke Barings a year later.

The size of the losses was not discovered until Leeson fled Singapore on February 23, 1995. Three days later, Barings collapsed with debts of £827 million. On March 6, 1995 the Dutch financial services group Internationale Nederlanden Group (ING) acquired Barings Bank for the token sum of £1. Renamed ING Barings, the bank became the investment banking arm of ING.

## BASF

FOUNDED IN 1865, BASF (Badische Anilin- & Soda-Fabrik) of Ludwigshaffen, Germany, pioneered the industrial manufacture of dyestuffs. In 2003, BASF operated more than 100 large manufacturing sites and supplied chemicals and plastics to customers in more than 170 countries.

In 1925, BASF merged with Bayer, Hoechst and three other companies to form I.G. Farbenindustrie AG. Between 1933 and 1945, I.G. Farben played a central role in the Nazi economy. During World War II, the company manufactured poison gas used at extermination camps, and employed forced labor and slave labor. The strength of the links between I.G. Farben and the Nazi regime prompted the Allies to order the dissolution of the company in 1945, and several company directors and senior managers were tried for war crimes and crimes against humanity.

In 1952, a newly formed BASF inherited the Ludwigshaffen manufacturing site, marking the beginning of a new phase of plastics-driven growth. From the 1960s onward, the company internationalized its manufacturing and marketing operations, moving into North America and Asia, and sought to vertically integrate its operations, acquiring or developing businesses making consumer products or high value-added products. The creation of a horizontally and vertically integrated company has made BASF vulnerable to accusations of price-fixing, and the company has fallen afoul of antitrust authorities in several countries. However, these cases pale in comparison to the recent case of vitamin price-fixing.

At the end of the 1990s, U.S. antitrust investigators uncovered a series of cartels to fix the price of vitamins led by Hoffman-La Roche and BASF, then the world's two largest producers of vitamins. In May 1999, BASF and Hoffman-La Roche pleaded guilty to charges brought by the U.S. Department of Justice that they led and participated in a worldwide

conspiracy to raise and fix prices, and to allocate market shares for certain vitamins between January 1990 and February 1999. Hoffman-La Roche and BASF agreed to pay fines of \$500 million and \$225 million respectively. This prompted similar investigations by the antitrust authorities in Australia, Canada, and Europe.

The European Union investigation resulted in BASF, Hoffman-La Roche, and six other companies being fined record amounts for colluding to fix the price of vitamins. Hoffman-La Roche and BASF were fined approximately \$462 million and \$296 million respectively for participating in 12 separate cartels. According to the European Union Competition Commissioner Mario Monti, the case was "the most damaging series of cartels the commission has ever investigated."

## Baycol

BAYCOL (or Lipobay and Cerivastatin) is a drug used to lower LDL (bad) cholesterol levels, thereby reducing the probability of a heart attack. Baycol belongs to a class of drugs known as statins that are designed to block the production of an enzyme that generates LDL.

It is very powerful and is therefore prescribed in low doses of 0.4 and 0.8 milligrams (mg). Baycol was released in the United States in 1997 by Bayer

AG, an enormous German conglomerate that manufactures chemicals and pharmaceuticals for global distribution.

By 1998, reports were being forwarded from physicians indicating adverse side effects from Baycol. In 1999, the Food and Drug Administration (FDA) approved the use of a potent dosage (0.4 mg) of Baycol. Several million people worldwide were taking Baycol and, in the process, were generating several hundred million dollars in profits for Bayer AG.

In 1999, Bayer AG responded to growing reports regarding the dangers of Baycol by issuing a warning on the drug's label and sent notices to doctors about the risks of prescribing Baycol in conjunction with a cholesterol drug called gemfibrozil, known on the market as Lopid.

In 2000, Bayer AG received approval from the FDA for a stronger, 0.8 mg version of Baycol even though the company had received a growing body of information stating that Baycol users were at a significantly higher risk of contracting rhabdomyolysis, a condition that dissolves muscle cells, releasing toxic chemicals into a patient's blood. Symptoms of rhabdomyolysis include, among others, dark urine, severe muscle pain, fever, dizziness, and vomiting—leading to an increased risk of kidney failure, paralysis, and (ironically) heart disease. By August 2001, the FDA announced that 31 Americans had died from taking Baycol with an unknown number of patients otherwise injured from the medication.

Also in August 2001, Bayer AG announced that it would remove Baycol from all global markets except Japan. Several hundred lawsuits against Bayer AG were settled, while several thousand additional lawsuits were ongoing. The company suffered a significant drop in its share values and has lost hundreds of millions of dollars in revenues and settlements, firing thousands of employees in an attempt to recoup these losses. Particularly noteworthy is the growing evidence that Bayer AG knew of the potentially lethal side effects of Baycol, but continued to market the drug. Its company report in 2001 stated that "The safety and health of our patients [has] priority over economic interests."

Roughly 100 deaths and 1,600 injuries have been reported in connection with Baycol use since 1997. Additional claims of injury continue. No criminal charges have been filed against Bayer AG as of early 2004.

## Beech Aircraft

THE BEECH Aircraft Corporation was formed in 1932 by Walter Beech as a small aircraft manufacturer. In 1947, the company introduced the Beech 35 Bonanza, a single engine, four-passenger general aviation airplane that became an immediate popular success. This aircraft was widely considered the finest small plane on the market due to its combination of a luxurious interior and advanced design. Most importantly, unlike traditional aircraft which utilized a T-shaped "straight-tail" with a rudder on the vertical portion of the tail and elevators on the horizontal portions, the 35 Bonanza utilized a "V-tail" system combining the rudder and elevators on two tail surfaces that extended at 45-degree angles to the fuselage.

This revolutionary configuration lowered costs, gave the Bonanza a distinctive appearance, and reduced drag, which, along with its large engine and streamlined aerodynamic styling, allowed the Bonanza to achieve significantly higher air speeds than comparable aircraft. The combination of design, comfort and performance made the 35 Bonanza the Porsche of small aircraft.

In the 1950s, problems with the 35 Bonanza V-tail began to surface. First, pilots noticed that the plane had a tendency to "slosh around" during flight which could cause disorientation in inexperienced pilots, especially during instrument-only flying, and may have led to excessive wear in the tail section as the planes aged.

More seriously, the Civil Aeronautic Board reported numerous incidents of mid-air breakup of the Bonanza, several of which received widespread attention through subsequent lawsuits. The plain-

tiffs in *Prashker v. Beech Aircraft* (1957), in particular, claimed that the rate of in-flight failure rate of the V-tail was 15 times that of other aircraft.

In nearly all cases, the structural failures of the planes were associated with bad weather conditions, and the breakups were attributed to pilot error. The handling and performance characteristics of the plane made it possible for novice pilots to exceed the performance envelope of the aircraft during extreme conditions, leading to a fatal catastrophic failure of the airframe, particularly in the tail section. The conclusion of a Federal Aviation Administration (FAA) study in 1964, indeed, found a high incidence of in-flight breakup for the V-tail but took no further action.

Throughout the 1950s and 1960s, Beech made structural improvements to the 35 Bonanza to strengthen the wing and tail sections. In 1960, the company introduced the Beech 33 Debonair/Bonanza, essentially a straight-tail version of the Bonanza 35 and followed this up in 1968 with the Beech 36 Bonanza, a 6-passenger straight-tail model based on a stretched version of the original 35 airframe.

As the number of tail failures continued to mount during the 1970s, a 1978 FAA-commissioned study found that while the Bonanza had one of the best overall safety records in the industry, the 35 V-tail Bonanza was 24 times more likely to suffer from in-flight structural failure than the otherwise identical 33 and 36 straight-tail models. Faced with an increasing public perception that the V-tail was unsafe, Beech executives staged a publicity campaign in an attempt to revive sales.

Ultimately, this tactic was unsuccessful and production of the V-tail was halted in 1982 although the manufacture of the straight-tail models continued. In 1984, after 232 reported in-flight failures and over 500 fatalities between 1947 and 1984, Beech and the Department of Transportation conducted tests that revealed structural flaws in the design that could cause tail failure during specific maneuvers at high speeds. The company issued a speed advisory to owners until the development a tail-bracing kit. Following refitting, the in-flight breakup rate of the V-tails fell dramatically, quickly matching that of the straight-tail models.

That the V-tail Bonanza kept flying for over 35 years without an adequate fix and increasing evidence of a serious flaw can be attributed to several factors. First, tail failure generally occurred as a re-

sult of pilot error without the realization or acknowledgment that similar pilot errors in the straight-tail models did not lead to such catastrophic consequences.

Next, Beech was unwilling to take the simple step of replacing the V-tail with a straight-tail design at the first hint of a problem because the company realized that much of the allure of the 35 Bonanza was its unique appearance. Finally, by the time the evidence of a problem became plainly clear in the 1970s, any admission of a design fault would have subjected the company to significant legal liability in pending lawsuits.

## Beech-Nut Nutrition

ACCORDING TO JAMES S. BENSON, former Deputy Commissioner of the Food and Drug Administration (FDA), the FDA works hard to ensure that the "companies that produce the products under the agency's jurisdiction comply with the federal Food, Drug, and Cosmetic Act and other statutes enforced by the FDA." When the FDA began studying the possibility that manufacturers of fruit juice products were misleading consumers in 1982, Beech-Nut ranked as the second-largest baby food company.

The baby food industry was dominated by Gerber Products owning 70 percent of the jarred baby food market for 40 years; Beech-Nut and H.J. Heinz each had 14 percent of the market. *Financial World* reports that Beech-Nut began, in 1977, trying to gain a greater market share by selling a "cheaper adulterated product."

Steven Kindel reported, "Sales of that product brought Beech-Nut an estimated \$60 million be-

tween 1977 and 1982, while reducing material costs about \$250,000 annually.”

When confronted by the FDA, Beech-Nut denied knowledge of any fraudulent conduct and refused to provide its records while sending FDA investigators on scavenger hunts to empty warehouses. When the company was finally forced to admit that its 100-percent apple juice was just sugar water, it claimed that the drink was still safe and should not be recalled; Beech-Nut agreed not to ship more bogus juice, but, in fact, continued to ship it. Beech-Nut stone-walled the FDA investigators long enough to sell an additional 700,000 cases of bogus juice and thus they were forced to destroy only 20,000 cases according to a report to the Nestlé Corporation which acquired Beech-Nut during the protracted cover up.

FDA investigators found that Beech-Nut had substituted colored water for apple juice over a period of years (1977–82). The 470-count indictment of the company and some of its officers charged them with conspiracy, mail fraud, and marketing flavored sugar water as apple juice with the intention of defrauding and misleading consumers. Beech-Nut pleaded guilty to 215 felony violations of the Food, Drug and Cosmetic Act and paid fines and costs of nearly \$2.2 million.

The Beech-Nut vice president for operations, John Lavery, was tried, convicted, and sentenced to one year and one day in jail. The president of Beech-Nut, Neils Hoyvald, was sentenced to six months of community service. Each man also paid a \$100,000 fine. In addition, the five companies that supplied the raw materials plea-bargained their way to lesser sentences.

Beech-Nut lost millions in “slumping sales because of the negative publicity generated by the case,” Joseph A. Raelin explains, and goes on to assert that Beech-Nut (and Nestlé) could have escaped much of the scandal if they had listened to their own director of research and development, Jerome LiCari, who had produced evidence that their supplier was adulterating its juice concentrate. If the company had followed LiCari’s advice, Beech-Nut would have been absolved of further liability. LiCari blew the whistle and resigned when his recommendations were ignored.

## Bendectin

FIRST MANUFACTURED by Merrell Dow Pharmaceuticals in 1956, Bendectin was a prescription drug used to alleviate nausea and morning sickness associated with pregnancy. Over 33 million pregnant women worldwide were taking the drug when Betty Mekdeci, a woman determined to find the cause of her son’s severe birth defects, linked the defects to the Bendectin she took during pregnancy. The story broke in the *National Enquirer* in October 1979, implicating Bendectin as the cause of birth defects among thousands of newborns in the United States.

Women taking the drug panicked; some had unnecessary abortions, and thousands more sued Merrell Dow Pharmaceuticals. At one point, the company was faced with more than 1,800 lawsuits from women whose babies were born with defects. The cost of litigation exceeded the profit from the drug, and, in 1983, Merrell Dow stopped manufacturing Bendectin.

Merrell Dow’s problem during litigation was a lack of scientific evidence. Specifically manufactured in 1956 for pregnant women, the three ingredients in Bendectin never underwent any reproductive toxicity tests. The only study to look at the teratogenic effects of the drug was performed by Merrell Dow researchers in the mid-1970s and it was of such poor quality that it did not hold up in court.

One of the Bendectin cases, *Daubert v. Merrell Dow*, actually lead the U.S. Supreme Court to set

guidelines for the admissibility of scientific expert testimony. Another problem was that Merrell Dow also neglected to mention the possibility of birth defects on Bendectin's pharmaceutical packaging label until 1981.

However, Bendectin is a safe drug; over 30 studies have proven that it does not cause birth defects. In fact, the Food and Drug Administration (FDA) continues to call the drug safe and the Centers for Disease Control reports no change in the incidence of birth defects in the United States after Bendectin was taken off the market. On the other hand, the number of pregnant women hospitalized for severe nausea has doubled since the drug was discontinued.

Duchesnay Inc., a pharmaceutical company in Canada, has continued to manufacture and distribute Diclectin, a drug identical to Bendectin. Duchesnay was petitioning the FDA in 2003 to sell the drug in the United States. Until approval, two of the three ingredients that make up Bendectin are available without a prescription, vitamin B-6 and doxylamine, an antihistamine found in Unisom. Many doctors have been instructing pregnant women suffering from nausea and its effects to find relief by combining specific amounts of these two ingredients.

## Bendix Corporation

IN AUGUST 1982, Chief Executive Officer Bill Agee, his wife and former strategy adviser Mary

Cunningham at his side, attempted to consolidate the Detroit-based manufacturer's position in the aerospace industry through a takeover of Martin Marietta. While Marietta undertook the largest ever "PacMan defense" (trying to buy Bendix first) the company's lead strategist, Martin Siegel of investment firm Kidder Peabody, illegally leaked the details to arbitrageur Ivan Boesky, who made a quick \$120,000 on Bendix stock. When the dust settled, Bendix was a subsidiary of a third firm, Allied Corporation; Martin Marietta had regained independence at the price of selling assets; and Boesky had cemented an insider-trading relationship with Siegel that would lead to Siegel's arrest in 1986.

Before resigning as vice president of strategic planning due to rumors that her rapid promotion had been earned in the bedroom rather than the boardroom, Cunningham had participated in developing a strategy for Bendix to become less dependent on the stumbling Detroit auto industry. Following this strategy, Bendix sold assets to build a cash reserve that would allow it to acquire technology-focused firms. After a failed pass at RCA, Bendix made an offer to buy 45 percent of Martin Marietta's common stock.

Wishing to avoid dismantling, Marietta countered with a two-tiered offer designed to stampede Bendix shareholders into tendering stock promptly. Marietta also persuaded defense contractor United Technologies to make a similar offer for Bendix stock. The scheme may have been aided by overlapping boards at United Technologies and Citibank, which had the power to tender the shares in the Bendix employee-held stock program.

A quirk in state incorporation laws made it possible for Bendix to gain control of Marietta but be unable to control Marietta's board, while Marietta could, days later, buy a controlling share in Bendix with immediate control of Bendix's board. If this happened, the companies would face debts worth triple their assets, plus years of legal wrangles. Bendix gained control of Marietta, but Marietta went ahead with its purchase of Bendix stock.

Agee engineered a deal to have Allied, an oil and gas company, buy both Bendix and Marietta. Allied then sold Marietta stock back to Marietta, making the company independent again. Financial journalist Alan Sloane estimates that the deal allowed the various players to take \$47 million in artificial tax losses. To cover debts incurred in the

merger battle, Marietta sold its cement and aluminum businesses. Rumors that United intended to buy Allied came to nothing.

Bendix was ultimately dismantled; after multiple mergers, its aerospace business went to Honeywell. The branded core business—manufacturing auto parts—was part of the Knorr-Bremse group in 2003. Agee was wafted into his own venture capital firm on a \$4.1 million golden parachute.

## Benson, Michael L. (1950–)

MICHAEL BENSON, A SOCIOLOGIST and professor of criminology, is the author of several books and articles on white-collar and corporate crime. He teaches criminological, white-collar crime, and life-course theories.

In 1998, Benson, along with co-author Francis T. Cullen, published *Combating Corporate Crime: Local Prosecutors at Work*. This book was the first major study of corporate crime prosecutions by local government. Benson and Cullen investigated how district attorneys, as publicly elected officials, actually responded to situations of corporate crime. Combining quantitative data and qualitative information, the book concluded that many prosecutors fail to hold corporate criminals accountable for behavior such as false advertising, unsafe working conditions, and environmental pollution.

The actions of prosecutors depended in large part on local economic, social, and crime conditions. The book by Benson and Cullen expounded on how factors such as population size, economic

conditions, and legal culture influence a community’s attitude toward corporate crime. Community context, in turn, “strongly influences prosecutors’ activity against corporate crime,” the authors explain. The communities with strong and diverse economies were more likely to take the risk of controlling corporate crime.

Benson and Cullen offered recommendations for improving local responses to corporate crime. Their suggestions at the national level were to establish laboratories to help prosecutors investigate and prosecute environmental offenses; establish an information clearinghouse on prosecuting corporate crime; and establish personnel exchanges between federal and state regulatory agencies and between regulatory agencies and local prosecutors.

Their recommendations at the local level were to recruit prosecutors and investigators who have an interest in corporate-crime prosecutions; create a local-area computer network linking agencies that can share information; educate the public about their role and make it easier for citizens to report corporate crimes; increase the number of prosecutors and investigators assigned to corporate offenses; and assign investigators to environmental regulatory agencies so that they can identify cases that should be brought to the attention of prosecutors.

Benson’s 2001 book, *Crime and the Life Course*, was a comprehensive overview of life-course theory as it applies to crime. The life-course perspective, in criminology, focuses on evidence of biological and genetic influences in criminal careers. Benson discussed an application of the life-course approach to white-collar crime. His research included a focus on the onset of offending behavior in white-collar criminals. He also described the connections between social locations, family backgrounds, educational trajectories, and conviction in white-collar offenders.

Benson’s research and publications continue to augment the study of white-collar and corporate crime. Effective prosecution of corporate crimes will depend on the implementation of recommendations such as those offered by Benson and Cullen in their analysis of obstacles faced by prosecutors of corporate crime.

## Better Business Bureaus

BETTER BUSINESS Bureaus, often referred to as BBBs, are free services developed to provide citizens with alerts to dubious advertising tactics or other similar problems associated with businesses. Better Business Bureaus are better referred to as a system of bureaus than as one bureau, as BBBs are established around the country and are charged with handling regional complaints and maintaining regional memberships.

Businesses may apply for membership with their regional BBB as a means of indicating to their customers that they subscribe to the most stringent of business standards and business ethics. The list of members is then available to interested parties via written requests or via the internet, with businesses being either rated as satisfactory or unsatisfactory.

A majority of the services offered by the BBBs are free to the general public, with the exception being the public mediation service offered by some BBBs.

All BBBs are interconnected through a national database. Therefore, if someone in Texas is having problems with a business in New York, then the BBB in Texas may be notified of the problem. The problem is then forwarded to the BBB in New York; this form of referral service is considered necessary because the business in question may be a member of the New York regional BBB and therefore be

more open to correction of the problem if influenced by the New York BBB.

The foundation for the Better Business Bureaus was formed in the early 1900s when the National Federation of Advertising Clubs of America was created with the intent of exposing individuals and companies that were presenting erroneous information about products and services. Prior to the establishment of this group, there was no regulation of companies and their advertising. Samuel Dobbs, who created the Ten Commandments of Advertising, was the organization's first president. Under Dobbs' leadership many regional advertising clubs began to emerge and sponsor local cities. In 1912, George Coleman, an advertising executive, formed a national group to monitor advertisement and business practices, and, in 1921, this organization was renamed the National Better Business Bureau. Today, there are numerous Better Business Bureaus in operation around the country.

Better Business Bureaus are often misunderstood by citizens who are under the impression that contacting the BBB is the first step in developing legal action against a business that has committed a wrong. BBBs do not normally get involved in criminal matters, and, in fact, few will even attempt to provide legal advice. Because BBBs are maintained on the basis of donations and small membership fees charged to businesses that are members of the regional bureaus, it is impossible to keep qualified attorneys on staff to answer complex legal questions. Should the BBB contacted determine that there is the potential for the development of a legal or criminal problem, then the group may recommend that the individual who was wronged contact the police or the district attorney. Additionally, BBBs do not normally get involved in disputes that arise between individuals and non-businesses; therefore, a dispute between two individuals would be declined for consideration by the BBB.

Advertising trends and claims are monitored by BBBs, with over 100 regional BBBs responsible for monitoring their areas. The information obtained from both this monitoring, and claims that are found to be with merit, are maintained in an internet database. A concerned citizen merely has to go online and locate her regional BBB or the National Better Business Bureau and search for information by company name, state, or city. Individuals who do not have access to the internet may still contact the BBB through the use of an automated telephone

system. Through consolidation of the information obtained in the course of operation, BBBs will routinely provide training or education for consumers concerning how to avoid becoming victims of fraud and improper business actions. With the increase of identity theft and credit-card fraud in recent years, many BBBs have begun offering training on how to spot potential identity thieves and how to prevent them from gaining access to personal financial information.

Through the national BBB website, individuals who have been victims of identity theft may access information related to repairing the damage caused by the criminal act. Another recent development by the BBB is the sanctioning of automotive car dealerships as a means of ensuring customer care and respect.

The future of the BBB is unknown but it is possible that the BBBs will become more involved in education relating to online shopping and electronic businesses as more specialized divisions continue to be developed.

ROBERT MOORE, PH.D.  
DELTA STATE UNIVERSITY

## B. F. Goodrich

IN 1870, Dr. Benjamin Franklin Goodrich established the B. F. Goodrich Company. It was the first rubber company west of the Allegheny Mountains, and set up headquarters in Akron, Ohio. However, it was in the year of 1969 that B.F. Goodrich received national attention, not for its products and revolutionary inventions, but for a scandal.

On June 18, 1967, the B. F. Goodrich Wheel and Brake Plant in Troy, Ohio, received a contract to supply wheels and brakes for a new air force aircraft. Goodrich proposed a lighter-weight, four-

rotor brake instead of the traditional five-disc brake. Before the air force could accept the brake, B. F. Goodrich had to present a report showing that the brake passed specified military qualifying tests. The last two weeks of June 1968 were set aside for testing the brake, giving Goodrich almost a full year for design and testing.

John Warren designed the brake, but Searle Lawson, a newcomer to B. F. Goodrich, was assigned responsibility for final production. Lawson began testing the brake using a prototype. In the first round of testing, the prototype reached 1,500 degrees. After a few tests, the linings of the brakes were almost totally disintegrated. Lawson tried new linings, thinking that was the problem, not the brake, but the same thing happened. He came to the conclusion that there was a design flaw, the four-disc brake was too small and a five-disc brake may be more effective. At this point, a redesign of the brake would mean delay and this meant that the brake would most likely not be ready for delivery on time. Goodrich had assured the air force that the four-disc brake was possible and would be ready. Warren, the original designer, did not want to admit to any error or like the idea that a new employee, fresh out of college, had found the error. Warren believed it was the linings that were the issue, not the brake design. According to Warren, the four-disc brake was viable, and that was that.

The disagreement between Lawson and Warren meant that upper management needed to be consulted. Lawson approached the project manager, Robert Sink to explain the problem. Sink, knowing the politics of the company, was not willing to disagree with Warren. He believed that Warren would be able to fix, or at least minimize, the problem, since he had designed the brake. Sink advised Lawson to continue testing the linings using various other materials. A total of 12 tests were conducted, each resulting in failure. It was becoming evident that the brake was faulty not the linings. Test flights by the air force were now only 70 days away. Only a major redesign could fix the problem. Panic set in. During the testing phase by Lawson, Sink had been continually assuring the air force that the brake tests were going smoothly, which was a complete fabrication.

In April 1968, Kermit Vandivier became involved with the brake. He had discovered many discrepancies between the military specifications and the qualification tests carried out at Goodrich. It

was Vandivier's job to write the appropriate documentation that would accompany the testing data in the qualification report. Given the discrepancies, Vandivier questioned whether he should write a report that was so out of line with the military specifications. Vandivier took his concerns to his immediate supervisor. He was assured that the testing laboratory would not issue a misrepresentation of the qualification tests. However, within a few days, a typewritten copy of the test logs was sent out. Virtually every entry in the test logs was significantly altered. On hearing of the interim report, Vandivier questioned Richard Gloor, test laboratory engineer, who told him that Lawson had directed the test lab to miscalibrate the instruments, at the order of one of Lawson's superiors. When Vandivier approached Lawson about the changed report, Lawson confirmed Gloor's account. Lawson told Vandivier that he had been told that no matter how the brake continued to test, Goodrich was going to qualify it.

The brake was nursed through the last test and Vandivier was told to write up the final report that it passed and was qualified according to specifications. Vandivier was incensed and refused to write a qualification report he felt was based on falsified data. He had no choice though. Goodrich submitted the qualification report on June 12, 1968, without either Vandivier or Lawson notifying the chief engineer or Goodrich corporate headquarters in Akron of their misgivings.

In mid-June 1968, flight tests on the brake began at Edwards Air Force Base in California. Lawson witnessed the tests on Goodrich's behalf. There were numerous mishaps during the flight tests. Both Lawson and Vandivier were concerned over the safety of the brake and the fact that the reports were falsified. They both decided, from advice from their attorneys, to go to the Federal Bureau of Investigation (FBI). At the same time, because of the various mishaps during testing, the air force was demanding the raw data from the qualification tests conducted by Goodrich. Goodrich declined the request.

Lawson resigned from Goodrich and Vandivier was dismissed from Goodrich for disloyalty. He soon took a job at the *Troy Daily News* and told his editor about the problems he had at Goodrich. The story reached Senator William Proxmire who was receptive to Vandivier's tale of misdeeds at Goodrich. On May 13, 1969, Proxmire requested that the Government Accounting Office (GAO) re-

view the brake qualification testing performed by the Goodrich plant in Troy. The GAO reviewed the operations at Goodrich and submitted a report to Proxmire on July 3, 1969. Once the report was received, Proxmire made a public announcement on the Senate floor about Vandivier's allegations against Goodrich and the GAO investigation.

In August 1969, a Congressional Hearing, chaired by Proxmire, was held before the Subcommittee on Economy in Government. The GAO Report and Congressional Hearing testimony illustrated that Goodrich's qualification testing procedures did not comply with government specifications.

The Goodrich brake scandal is an example of how a corporation may duck responsibility for the sake of making a profit, and how employees may blow the whistle on such fraud. The brake could have caused major malfunctions in the aircraft and pilots could have died, but luckily, the defective brake was never used. Goodrich eventually went back to the five-disc design.

## bid rigging

**BID RIGGING CONSTITUTES** a violation antitrust law. It is closely related to horizontal price-

fixing, in that both offenses involve collusion between supposed competitors in the same market group. Horizontal price fixing is a conspiracy between businesses at the same market level to set a fixed price for their product. That price is often set well above of what the price would be if it were set in a truly competitive market.

For example, two large beverage companies have been charged several times over the years with fixing the price of soft drink syrups, as well as the price of the final soft drink product. Were the companies to have competed honestly in the market, it is likely that the price of those products would have been much lower than they were. Horizontal price-fixing is a very common offense, in part because it is very difficult to prove that a conspiracy to fix the price of a product actually has occurred.

Bid-rigging comes about in situations in which companies are required to competitively bid on contracts. Competitively bid contracts are very common in the marketplace, particularly in government and education, where agencies are generally required to accept the lowest bid for a contract. For example, schools advertise for annual contracts for milk and bread. It is not unusual for competitors in the same market place to conspire to allow one or the other to win a competitive bid in rotation.

The end result is that each of the companies will make a profit, often at a price well above that which they would have earned in a truly competitive market. The added costs resulting from the rigged bid are passed on to taxpayers, ratepayers, and consumers. An example of a major bid-rigging case was described by Gilbert Geis in his classic article (1967) about the heavy electric equipment cases of 1961. In those cases, all of the major producers of electricity-generating equipment conspired to rig the competitive bids for equipment to be sold to the Tennessee Valley Authority (TVA) during the 1940s to 1960. Managers of the companies, such as Westinghouse and General Electric, would periodically meet to determine which company would submit the winning bid, and what price each company would bid.

The conspiracy cost TVA millions of dollars in excess of what it would have had to pay if there had not been collusion in the market place. The conspiracy collapsed when TVA received two identical bids for the same contract. TVA contacted the Antitrust Division of the U.S. Department of Justice, which developed criminal and civil cases against the com-

panies and their managers. The companies pled guilty, as did a number of the managers. A few of the managers served brief jail terms, and the companies paid fines. As Geis pointed out, though, for General Electric the fines were equivalent to a person having to pay a \$2 parking fine. Bid rigging, like price fixing, is hard to prove. Often, the only way that bid rigging is detected is when a bidding error is made, as in the TVA case.

## board of directors

INVESTORS DEPEND on the board of directors to govern a firm, to set its strategic quality and direction, and to improve their shareholder value. Banks and stock exchanges around the world have started to assess the effectiveness of boards of directors regarding their role and composition, and have a main focus on developing good corporate governance practices. The trust that investors have placed in boards of directors has, in the late 1990s and early 2000s, been damaged by several abuses and business scandals.

Research into boards of directors reveals they are dominated by a tradition in which board composition is related to firm performance, and this has galvanized the efforts of large-scale investor groups to initiate boardroom changes.

Researchers Shaker A. Zahra and John A. Pearce (1989) highlighted the main differences between board attributes (composition, characteristics, structure, and process) and board roles (service, strategy and control). On the other hand, scholar Andrew A. Pettigrew (1992) synthesized and re-

viewed elements of the research on managerial elites. This survey discussed research from three different conceptual traditions (interlocking directorates and the study of institutional and societal power, boards of directors, and top management teams).

The author found that studies of boards of directors remain at an early stage. Before links can be made between independent (most often, board composition) and dependent (most often, various measures of firm performance) variables in research about boards, there is a need to go deeper into the substance. Also, other scholars found that the research provides little consensus as to the specific configuration of effective boards. Findings are inconsistent and links are modest. More insight needs to be gained into the purpose and meaning of company organization and direction with a board of directors at the helm.

## PERFORMANCE AND ROLE

Board task performance and board roles have been categorized in various ways. Categories are based on legislation, theories, stakeholder expectations, and induction. The most common distinction is between the board's control roles and service roles. The strategy roles and resource dependency roles are in many studies or reviews also treated as general categories, but more specific board roles such as networking, lobbying, advising, influencing, ratifying, being a sounding board, etc. are also used in some studies. Some studies also present the board's roles in various business functions such as finance, operations, human resources, markets, and product development.

The composition of board members has traditionally been the measure used when studying boards. The most common board-member variables have been board size, chief executive officer (CEO) duality, and various measures of insider/outsider ratios. There has also been an interest in the number of women directors. In studies, there has also been an interest in outside directors, family members, founders, and venture capitalists. In addition, board members should be studied both from a supply side (board members seeking assignments) and a demand side (companies seeking board members).

What motivates individuals to sit on a board, and what motivates them to focus energy, effort, and time to working on a board? How are board

members selected? What are the attributes of board members that are needed beyond affiliation, gender, and independence? What are the roles of industry experience, age, and tenure? What characterizes women directors versus male directors? What is the role of homogeneity versus diversity with a decision-making body? What aspects of homogeneity and diversity exist and are important to decision makers? What are the dynamics when directors' interlock (sit on different boards of intertwined companies)? We still know little about how much time it takes to be a board member or the outcome of attendance to the decision-making process of board members.

Board working structures include: frequency of meetings, location of meetings, time of meetings, the setting and distribution of the board agenda, form, content, distribution and follow-up of board minutes or protocols; and the organization and leadership of the board. How formal are the board meetings, and what is the order of the board agenda? How formalized are the rules of the boardroom and how often are board members absent from board meetings? How does voting take place and how often are disagreements written down in the protocols?

The importance of processes inside and outside the boardroom has been highly emphasized by many authors, but the traditions for studying and observing board processes are limited. Concepts related to board processes are: "Rules of the game," reciprocity, trust, and integrity; and emotions, power, coalitions or alliances, and ruling techniques. The questions of board independence, effort norms, cognitive conflict, and the use of knowledge/skills are also greatly related to board processes.

The relationship that has received the most attention is between board members and firm performance. A series of papers clearly shows that it is difficult to find any reliable patterns in the large number of studies of these relationships. Research should thus probably be re-addressed toward studying the effects of board size, board composition, and CEO duality on firm performance.

What influences board members? One immediate alternative would be to use the mentioned board variables as dependent rather than independent variables. Environmental contingencies may influence the selection and composition of board members. This influence may be direct as well as indirect.

Some scholars argue that boards are empowered by various kinds of trust relationships between internal and external stakeholders. Some of the relationships between attributes of the board members and board task performance may be direct, but there may also be mediated effects, and some effects may be moderated. The board's working approach will have such effects, according to researchers Ada Demb and Friedrich Neubauer (1992). The working approach includes board structures and processes.

What is the relationship between board task performance and firm performance? A fair answer may evolve from another source outside the confines of current literature. At the most practical level, the prevailing knowledge highlights serious problems in literature reviewing corporate governance based entirely from a research perspective of a board of directors.

In short, the importance of boards of directors in corporate governance has been widely reviewed in scientific literature. However, the diversity of measures and concepts involved in the various streams of research make it difficult to interpret and come to a conclusion about the nature of the influences emerging from the power base of a board of directors.

Over the last few years, almost all European countries adopted corporate governance codes of conduct to increase transparency, and reduce managerial opportunism. European nations are attempting to ensure corporations are taking into account all the interested parties and not just the select few interested in self-preservation.

## Boesky, Ivan (1937–)

IVAN BOESKY IS a first generation American. His father, William, immigrated to the United States from Russia in 1912. The elder Boesky owned several nightclubs in the Detroit, Michigan, area. Striping and topless dancing were introduced to increase their profitability. This drive for maximum profits and dedication to hard work would be a driving force for Ivan throughout his life.

Boesky, with the work ethic instilled in him by his father, sold ice cream from the back of a truck. He was repeatedly arrested for breaking the conditions of his license, which stated his curfew was 7:00 P.M. Ivan attend Cranbrook, a college preparatory school in the suburbs of Detroit. Academically, he was average. He did, however, distinguish himself as a superior wrestler, winning his school's award as the most outstanding wrestler. After his sophomore year, he transferred to Munford High in Detroit's inner-city.

Boesky, attended several institutions of higher education, Wayne State, Eastern Michigan College and University of Michigan, but he never graduated. After spending a few years in Iran, where he admitted he worked for the CIA, Boesky enrolled in the Detroit College of Law. The less than prestigious law school did not require a degree for admittance. Upon his graduation in 1964, he was rejected by every law firm in the Detroit area to which he applied.

Boesky met his future wife, Seema Silberstein, in 1960. Her father was a successful real estate developer in the Detroit area. They were married and Boesky's first job was serving as a clerk for a federal district court judge who was a relative of Seema. Soon after, a former Cranbrook prep school classmate introduced Boesky to the term *merger arbitrage*.

In its basic form, merger arbitrage deals with investing in potential take-over targets, and then realizing the profits when the merger is completed. This seemed to intrigue Boesky and he soon had his

sights set on the world of high risk and high reward that could only be found in New York City.

Ben Silberstein, Boesky's father-in-law, set-up Boesky and his wife in a luxurious apartment on New York's Park Avenue. He quickly secured employment in a trainee position at L.F. Rothschild. After a year he headed to First Manhattan where he got his first experience in arbitrage. Soon after, he took a position at Kalb Voohis. After he lost \$20,000 in a position, he was subsequently dismissed.

Boesky was not deterred by his dismissal. He soon landed a position with Edwards & Hanly. He quickly used maximum leverage and \$1 million positions and actually influenced individual stock prices. Boesky trading tactics caught the eye of the Securities and Exchange Commission (SEC). He received a \$10,000 fine from the SEC for shorting stock improperly. In 1975, these questionable and aggressive actions bankrupted Edwards & Hanly.

#### IVAN F. BOESKY CO.

In 1975, Boesky was ready to go into business for himself. He founded Ivan F. Boesky Co. and needed investors. He advertised in *The Wall Street Journal* touting the profit potential that the world of arbitrage offered. Boesky organized the company so investors incurred 95 percent of the losses and shared 55 percent of the potential profits. Boesky's firm was responsible for the other 5 percent of the losses, and Boesky would pocket 45 percent of the profits for himself. While Boesky did attract several investors, he had to rely on Seema's family to furnish the rest of the capital needed for the company to get off the ground.

Boesky was a workaholic. In a 1984 article in *The Atlantic Monthly*, Connie Bruck describes a typical day the life of Boesky. She described him arriving home at 1:00 A.M., then doing homework until approximately 2:30 A.M. He then went to bed and usually woke before his alarm sounded. Boesky continued to do paperwork while being driven into Manhattan for a 6:00 A.M. meeting. He went from one meeting to the next, but was always behind his desk when the market opened at 10:00 A.M.

Boesky was involved in numerous highly profitable investments and arbitrage cases in his career. In 1981, after an employee commented that a new movie, *ET*, would be one of the largest box office movies of all time, Boesky bought 250,000 shares of

the movie's producer, MCA, at a cost of \$10 million. In the next two days he made \$500,000 in profit. Boesky's attention to detail and research paid off in several large arbitrage cases. Boesky held large positions in Texaco's takeover bid for Getty Oil, and Standard Oil Company of California's bid for Gulf Oil. These two deals grossed Boesky an estimated \$115 million.

In the mid-1980s, Boesky authored *Merger Mania: Arbitrage: Wall Street's Best Kept Money-making Secret*. In this book, he describes how speculators can gross large profits by investing in companies that are takeover targets. Boesky also spoke as the commencement speaker at the University of California's graduation ceremonies in 1986 where he stated "Greed is all right" and "I think greed is healthy." These remarks generated a large round of applause.

Boesky's fall from grace began in 1985 when the SEC charged David Levine with insider trading. The SEC learned that Boesky had received a percentage of the profits from Levine for insider information. In an agreement with the SEC, Boesky began to record conversations with other arbitrageurs and junk bond dealers. These recorded conversations led to the indictments and convictions of several prominent people in the world of high finance. Michael Milken of Drexel, Burnham, Lambert, was a high-profile conviction. He was sentenced to 10 years in prison and ordered to pay into a \$1.3 billion fund to settle several hundred lawsuits.

Boesky's cooperation with SEC allowed him to divest most of his assets. This saved him millions of dollars in liability. Boesky was sentenced to five years in prison. Although he escaped a fine, he did agree to pay the SEC \$100 million for insider trading irregularities he was associated with. In 1990, Boesky was paroled and sent to a halfway house in Brooklyn, New York. While there, he served as a consultant earning a meager \$200 a week. This was far from the earnings he had made as a feared tycoon on Wall Street.

## Boland Amendment

SHORTLY AFTER taking office on January 20, 1981, Republican President Ronald Reagan decided that he would do everything possible to overthrow the Sandinista pro-communist regime in Nicaragua. Reagan regularly sent requests to Congress seeking appropriations to support the rebel anti-communist Contras, and Congress complied for two years.

However, after it became known that the Central Intelligence Agency (CIA) had been mining the harbors in Nicaragua, Congress realized that if CIA explosives destroyed Soviet ships anchored nearby, an international incident of gigantic proportions could occur. Congress subsequently withdrew its support for funding the Contras. Undaunted, Reagan continued his quest to overthrow the leftist Sandinista regime. The activities of his administration created a major scandal and threatened his presidency.

In response to the president's activities in Nicaragua, on December 1, 1983, Congress passed the first Boland Amendment, attaching it to an omnibus appropriation bill for fiscal year 1983. The Boland Amendment, named after its chief sponsor Edward P. Boland (D-MA), prohibited the CIA, the Department of Defense, and other government agencies or entities that were involved in intelligence from using any funds whatsoever "for the purpose of overthrowing the government of Nicaragua or providing a military exchange between Nicaragua and Honduras." The Boland Amendment passed both house of Congress. Without a line-item veto, Reagan had no choice but to accept the amendment or veto the entire appropriations bill.

He signed the Boland Amendment into law on December 21. Because Congress attached the Boland Amendment to defense appropriations, the restriction was effective only from December 1984 to December 1985.

Even before the Boland Amendment took effect, Reagan had already told National Security Ad-

viser Robert "Bud" McFarlane, to keep the Contras together "body and soul." The fact that the first Boland Amendment contained two significant loopholes made McFarlane's task easier. First, Congress had given the CIA permission to offer aid to the Contras as long as its stated purpose was something other than overthrowing the Sandinistas. Second, the Reagan administration had determined that it could use the National Security Council (NSC) rather than the CIA to conduct covert activities in Nicaragua and still obey the letter of the law. Four months later, the president was still assuring Congress that he was not trying to overthrow the Nicaraguan government at the same time that his administration was busily seeking ways to fund the covert activities. As 1985 drew to a close, Congress was determined to end all funding to the Contras and informed the president that the \$24 million appropriation for humanitarian aid for 1985 would be the last appropriation.

On December 8, 1985, Congress passed the second Boland Amendment aimed at closing the loopholes of Boland one. It was structured to pick up when Boland one expired and to remain in effect until December 30, 1986. In the new amendment, Congress prohibited any government agency from offering military and paramilitary support for the Contras and banned the Reagan administration's practice of soliciting funds from third-party countries and private donors. During debate on Boland two, Representative Boland was asked if there were any exceptions to the ban, and he stated that there were none. Even humanitarian aid to the Contras was banned. Representative Dick Cheney (R-WY) called Boland two a "killer amendment," specifically intended to make the Contras give up their fight.

After the Iran-Contra scandal broke (which revealed covert funding for the Contras), Congress investigated the Reagan administration's defiance of the Boland Amendment and learned that between 1984 and 1986, Reagan and the NSC staff had raised \$34 million for aid to the Contras from third countries such as Saudi Arabia. Millions more were raised from donors at conservative fundraisers.

Initially, these funds were deposited in a Swiss bank account controlled by the Contras, but in July 1985, Lieutenant Colonel Oliver North, a member of the NSC staff, took control of the money. For 19 months after Congress banned funding to the Nicaraguan Contras, the Reagan administration

continued to conduct a covert war in the Central American country.

In July 1989 Senator Daniel Patrick Moynihan (D-NY) introduced a bill designed to permanently keep a president from subverting the wishes of Congress by making it a felony to do so. Reagan's vice president and successor, President George H.W. Bush, promised to veto the bill if it passed, arguing that it was an intrusion into a president's constitutional right to conduct foreign policy. The bill passed both houses of Congress, and Bush vetoed it as promised.

## bond fraud

**BOND FRAUD** involves the sale of stolen, fraudulent, or worthless United States securities. The Securities Act of 1933 defines a security as "any note, stock, treasury stock, security future, bond, collateral-trust certificate, or certificate of deposit." The most common bond used to perpetrate fraud is the historical bond.

Historical bonds, which were once valid securities of various American entities, are now worthless as securities and only collected and traded as historical memorabilia. Swindlers are selling historical bonds to naive investors at prices far exceeding their fair value as collectibles, claiming that the bond is worth millions of dollars, is redeemable in gold, and is backed by the U.S. Department of the Treasury.

Swindlers typically supply third-party valuations or authentications supporting their claims.

These bonds, however, have no value as investment securities, are not redeemable in gold, and were never backed by the Department of the Treasury.

### RAILROAD BONDS

The most popular historical bond peddled by swindlers is the railroad bond. According to the Department of the Treasury, there are 12,000 to 15,000 different varieties of railroad bonds in existence. The most common railroad bond in circulation is the Chicago, Saginaw, and Canada Railroad Company. In 1873, the Chicago, Saginaw, and Canada Railroad Company issued 5,500 30-year gold-backed bearer bonds, which paid 7 percent interest to finance construction of the proposed railroad. In 1876, the Chicago, Saginaw, and Canada Railroad Company was forced into bankruptcy and its assets were acquired by CSX Transportation Incorporated. CSX Transportation did not assume any of the Chicago, Saginaw, and Canada Railroad Company's outstanding debt, including the railroad bonds. All claims to money due under the bonds, which had a face value of \$1,000 apiece, was settled during Chicago, Saginaw, and Canada Railroad Company's bankruptcy preceding.

At that time, investors presented their bonds for payment and received less than 25 cents on the dollar. Following the bankruptcy preceding, the bonds were stored in the court archives until they were discovered in the basement of a federal building. At that time they were purchased by a museum in Michigan, packaged with other historical information about the Chicago, Saginaw, and Canada Railroad Company, and sold as collector's items for \$29.95 each.

The U.S. District Court for the District of Wyoming held that the Chicago, Saginaw, and Canada Railroad Company bonds possess only nominal value as collectibles. On January 20, 1998, the Securities and Exchange Commission (SEC) filed a motion for preliminary injunction against Daniel Schneider and three codefendants. The SEC alleged that Schneider, doing business under the name of Global American Prosperity Foundation, perpetrated securities fraud in violation of the Securities Act of 1933 and the Securities and Exchange Act of 1934.

The Securities Act of 1933, often referred to as the truth in securities law, requires that "investors receive financial and other significant information

concerning securities being offered for public sale and prohibits deceit, misrepresentations, and other frauds in the sale of securities.” The Securities and Exchange Act of 1934 prohibits certain types of conduct in the securities market and empowers the Security and Exchange Commission with disciplinary powers over regulated entities and persons associated with them.”

During trial, Schneider testified that he had sold Chicago, Saginaw, and Canada Railroad Company bonds to various individuals for approximately \$40,000 per a bond. Witnesses testifying on behalf of the Securities and Exchange Commission stated that the bonds were accruing 7 percent interest since their issuance in 1872. Therefore, the bonds could be cashed at a bank for a price of \$2 million to \$5 million per bond. Schneider also claimed that there was minimal risk associated with the purchase of the bonds because they were secured by gold bullion and coins. According to the court, the plaintiff “convincingly demonstrated the existence of an elaborate shell game designed to defraud easily duped investors.” On August 31, 1999, Schneider was found guilty of violating the Securities Act of 1933 and the Securities and Exchange Act of 1934.

#### TREASURY BONDS

There are a number of fraudulent schemes involving United States Treasury bonds originating in the Far East and in particular the Philippines. According to the Department of the Treasury, one type of fraudulent bond being produced in the Philippines is the Federal Bond. The United States purportedly shipped these bonds to the Philippine Freedom Fighters during World War II to assist with the war effort. In actuality, these fraudulent bonds have been produced by scanning the images of George Washington from the \$1 bill, Ben Franklin from the \$100 bill, and Grover Cleveland from the \$1,000 bill into a computer graphics program. The amounts are then altered to read \$100 million and \$500 million and coupons are attached in both the English and Chinese language. The fraudulent bond is then printed using modern color copiers or printers. The Department of the Treasury did not issue bonds in \$100 million or \$500 million denominations during this time period. In February 2001, the U.S. Secret Service seized more than \$2 trillion worth of these fraudulent bonds in the Philippines.

A second fraudulent bond being produced in the Far East is the Chiang Kai-shek Bond, which has a face of \$100 million. According to the Treasury, it has been alleged that these bonds were issued by the Central Intelligence Agency between 1930 and 1940 to help fund the Chinese Nationalist regime of Chiang Kai-shek in his war against the Chinese communists. The bonds supposedly were buried in caves by Chiang’s generals and heirs for years before recently being discovered. They are now being fraudulently offered to people at a fraction of their face value. According to the United States Department of the Treasury “this story is false and these securities do not bear provisions that even remotely resemble Treasury securities.”

#### JUNK BONDS

Fraudulent schemes involving U.S. securities have occurred on a much larger scale, having a tremendous impact on Wall Street. Beginning in 1970, at a time when the bond market had stagnated and bonds were at their lowest points since the Great Depression, a new breed of investment banker was emerging. One would eventually become the symbol of greed that would corrupt Wall Street and his name was Michael Milken. Milken attended the University of Pennsylvania’s Wharton School of Business and worked part-time for two years with the firm Drexel Harriman Ripley.

Prior to completing his studies at Wharton, Milken was offered a position in what was now Drexel Firestone’s research department on Wall Street. Milken soon moved to the company’s bond trading department. Since his undergraduate days, Milken had been fascinated with a very small area of the bond market, high yield, low-grade bonds, or what would eventually be called junk bonds. A majority of the bonds trading on Wall Street at the time Milken arrived, however, were investment-grade and rated AAA. They were virtually risk-free, however, they barely earned a bit more in interest than a U.S. Treasury bond. Milken’s specialty was deep-discount bonds, which were rated BB or lower.

At this time there was little demand on the market for junk bonds and trading was extremely limited. Investors were reluctant to place their money in unrated debt. Moreover, these bonds were issued by obscure companies whose credit strength was extremely weak and at times questionable. Milken, however, was able to find a place for junk bonds and

beginning with \$2 million in capital, he was able to generate a 100 percent rate of return.

When an economic recession hit in 1980, investment bankers began bailing out of the junk bond market. Milken, however, continued to increase Drexel's control over the market. He devised ways in which to creatively restructure debt. While some underwriters were suffering default rates as high as 17 percent, Drexel's defaults never exceeded 2 percent. By 1983, the junk bond market was larger than ever and, as one commentator put it, "Drexel was entrenched firmly at the top and Michael Milken was hailed as the king." Milken continued to expand his empire and in 1985, he partnered with Ivan Boesky and devised a strategy for establishing the largest arbitrage organization in history. Boesky dissolved his corporation and raised \$220 million from a new group of limited partners, and Milken raised \$660 million with junk bonds. Boesky had no difficulty attracting partners to put up \$220 million, while Milken struggled to sell investors on a \$660-million arbitrage fund. Eventually, however, the money was raised.

In the spring of 1986, the Los Angeles based home building products company, Wickes Corporation, was emerging from bankruptcy. The chairman of Wickes, eager to acquire another corporation, turned to Milken. Milken was able to raise hundreds of millions of dollars by issuing junk bonds and preferred stock, which paid a 10 percent dividend in order to attract investors.

There was, however, an unusual provision included in the preferred offering that read, "If the Wickes stock rose to a specific level, the company could redeem its preferred stock and replace it with common stock." Meanwhile, Milken had Boesky manipulate the Wickes stock by purchasing 2.8 million shares over a very short time period. This inflated the price, which allowed Wickes to eliminate the preferred stock and in the process save approximately \$15 million per year.

#### BOESKY & MILKEN

The following year, Boesky arranged a meeting with Milken at a Beverly Hills, California, hotel. When the two met, Boesky wanted to talk about a \$3.5 million kickback he owed Milken from the arbitrage deal. Milken simply responded by telling Boesky to keep it. Boesky steered the conversation to the two's business dealings, while Milken chose

to speak of electronic surveillance. Unknown to Boesky, Milken had been made aware of the fact that Boesky had agreed to cooperate with the Securities and Exchange Commission in exchange for leniency in sentencing for insider trading. Just two weeks later, Boesky's ongoing cooperation was announced and by mid-1988 he was in prison serving a three-year sentence. The investigation into Milken had come to a standstill. In September, however, Milken's top salesman agreed to cooperate with the government in exchange for immunity from prosecution.

The government immediately filed federal racketeering charges against Milken. Drexel, Milken's employer, entered into a plea bargain in which it agreed to acknowledge wrongdoing, pay a \$650 million fine, and suspend Milken. In March 1999, Milken was indicted by a federal grand jury on 98 felony counts and racketeering charges. Six months later, the junk bond market collapsed and Milken pled guilty to six felonies and paid a fine of \$600 million. On November 21, 1990, Milken was sentenced to 10 years in prison, which was later reduced on appeal to two years. Milken's control and manipulation of the junk bond market had come to an end.

#### SALOMON BROTHERS

One year later in 1991, the major Wall Street investment firm, Salomon Brothers, successfully took control of the U.S. Treasury Bond market. Salomon was one of a select group of buyers allowed to bid on government securities in the primary market. The primary market is a market for new issues of securities. The securities purchased in the primary market are then resold in the secondary market to the general public.

In order to ensure competition in the primary market, federal regulations prohibit individuals or firms from purchasing more than 35 percent of any bond issue. On three separate occasions, however, Salomon traders far exceeded that limit by submitting fraudulent bids using the names of their clients. Consequently, Salomon effectively cornered the Treasury bond market, and, in the process, illegally inflated its profits. Shortly thereafter, the head of the bond-trading desk at Salomon Brothers was accused of manipulating the bidding at government auctions of Treasury securities, which had resulted in millions of dollars in illegal profits.

## boycott

THE FEDERAL Trade Commission (FTC) ruled in 1998 that toy retailer Toys "R" Us had, in the late 1980s and 1990s, engaged in an illegal boycott of warehouse clubs by indicating that it would not do business with toy makers who also did business with the clubs, thereby coercing manufacturers to institute a boycott of the warehouse clubs. Toys "R" Us was the major toy retailer, controlling more than 40 percent of the market. Both the threat to withhold business from the manufacturers and the attempt to force other toy suppliers to boycott the warehouse clubs were illegal boycotts under antitrust law.

The term *boycott* is named for Captain Charles Cunningham Boycott, whose ruthless evictions of tenants in Ireland in 1880 provoked his employees so much that they refused to have any dealings with him or his family. In the United States, the principal historical use of the boycott has been in labor dis-

putes, but consumer and business groups have used it as well.

Not all boycotts are illegal. Generally, a primary boycott is legal. The primary boycott is, as in the example of Boycott's employees, a refusal to have dealings with the offender. For instance, protesting employees and their sympathizers might refuse to use an employer's goods or services, as in the 1960s boycott of table grapes by the United Farm Workers Organizing Committee and sympathetic consumers. The primary boycott is legal and accepted practice because, although it attempts to use economic means, its ultimate goals are political or social.

Another form of legal boycott, defined as Constitutionally protected speech exempt from the Sherman Antitrust Act, is the boycott of government when there is no economic motive. The government is not a competitor or a customer or engaged in any commercial relationship. And the Constitution always overrides mere legislation.

The secondary boycott is an attempt by the offended party to coerce a third party into joining the boycott, or to boycott that third party if it does not join. This is the type of boycott that the Federal Trade Commission (FTC) found Toys "R" Us had engaged in. Initially, the Sherman Antitrust Act outlawed both types of boycott. Section I of the act defined price fixing, agreements to share markets, and combinations to boycott as pernicious restraints of trade that were absolutely illegal.

A combination could consist of as few as two persons (individual or corporate). The Danbury Hatters' Case (*Loewe v. Lawler*, 1902) arose when the hatters' union boycotted the products of a Danbury, Connecticut, hatmaker. The manufacturer sued, and the court ruled in 1908 that the boycott violated the Sherman Act and that the individual members of the union were liable for treble damages. Not until the Norris-LaGuardia Act of 1932 did unions find relief, and that lasted only until the Taft-Hartley Act (1947) and the Landrum-Griffin Act (1959) reestablished the prohibition on secondary boycotts. Although the laws remained in effect into the 21st century, enforcement was rare.

When the federal government used the Sherman Act to break up Standard Oil in 1911, the U.S. Supreme Court ruled that the oil monopoly was clearly a violation of the act, but Chief Justice Edward D. White's court softened the law by establishing the concept of reasonableness.

Not all combinations in restraint of trade were illegal, just unreasonable ones. Defining “reasonable” has been an ongoing legal process since then. Within the limits of the Sherman and Clayton antitrust acts, there are specific restrictions on the boycott as a tool against economic competition.

For instance, when Toys “R” Us and the toy manufacturers joined to keep the warehouse clubs from receiving the popular toys, that was a group boycott, a violation of antitrust law. Other cases in this category have occurred frequently when trade associations—pharmacists, dentists, and others—have objected to reimbursement rates and decided at their meetings that they would refuse to provide the services for which they deem reimbursement to be inadequate. The collective action has an adverse effect on both the state and other reimbursing agents as well as on the consumer. It is an illegal boycott, an attempt to restrain trade.

Group boycotts are also illegal if they force the boycotted party to pay higher prices, or prevent or hamper a competitor’s entry into competition. When medical doctors combine and boycott for the purpose of keeping a managed care facility out of their territory, or when retailers decline collectively to conduct business with a manufacturer that also wants to do business with a competitor, that is an illegal boycott. Generally, the rule is that if the boycott affects price competition and has no other public good, then it violates the antitrust acts. It is also illegal to bar potential competitors from access to necessary competitive information. It is not a violation for a company to agree with another company, when the former sells a subsidiary to the other, not to raid the subsidiary’s employees for a given period of time. This action is rather a positive enhancement of trade.

#### ILLEGAL BOYCOTTS OVERSEAS

In the 1970s, the illegal boycott laws expanded to cover participation by American citizens in overseas boycotts. The laws were the 1977 amendments to the Export Administration Act (EAA) and the Ribicoff Amendment to the 1976 Tax Reform Act (TRA). These laws were passed to ensure that U.S. firms did not participate in boycotts that the U.S. government did not support. The purpose was not primarily economic, although one applicable section of U.S. Code did pertain to restrictive trade practices; rather it was an attempt to retain control

of foreign policy and to prevent American businesses from being tools of policies counter to those of the U.S. government.

The immediate trigger was the Arab League boycott of Israel, but the laws covered all foreign boycotts not supported by the United States. The laws applied to all U.S. companies and individuals and foreign affiliates—even offshore businesses that did not conduct transactions in the United States. Specific prohibitions included boycotting Israel or blacklisted companies, discrimination against individuals on the basis of race, religion, national origin or nationality, and providing such information about Israel or a blacklisted company or person. Companies were barred from accepting letters of credit that specified these terms. Boycott related agreements could cost tax benefits, but there was no legal penalty.

In summary, the tendency of American corporations and trade associations to serve their own interests first has led to a highly complex, almost esoteric, body of law as litigation establishes the niceties and the technicalities of what is, and what is not, an illegal boycott. Generally, though, a group boycott must be an agreement among competitors to not deal with or otherwise bar a specific entity for commercial reasons. And the boycotting group must have economic significance, that is, the ability to alter competition through their acts, or the boycott is moot. Theoretically, an illegal boycott is well defined. In practice, because evidence is rarely complete and motives are almost never pure, application of criteria is quite difficult, and determination that a boycott is illegal commonly requires resolution through the courts.

## Braithwaite, John (1951–)

IN 2003, John Bradford Braithwaite was a professor and federation fellow in the Law Program at Australian National University's Research School of Social Sciences. Braithwaite also served as the chair of the Regulatory Institutions Network. He was educated at the University of Queensland, where he received his Ph.D. in sociology in 1977.

Braithwaite is a well-known and highly respected scholar in the field of criminology as a pioneer of new research and theories in white-collar crime. In his book, *Corporate Crime in the Pharmaceutical Industry* (1984), Braithwaite reports: "Phar-

John Braithwaite has pioneered white-collar crime research in pharmaceutical and healthcare industries.

maceutical companies face great temptations to mislead health authorities about the safety of their products. It is a make-or-break industry. Many companies get virtually all their profits from just two or three therapeutic winners. Most of the data that the Australian Drug Evaluation Committee relies upon in deciding questions of safety and efficacy is data from other countries, particularly the United States. Inquiries into scientific fraud in the United States have shown there is a substantial problem of fraud in safety testing of drugs in America, just as has been documented in Japan."

Braithwaite's other books and work focus on corporate crime and accountability, and more recently, restorative justice and responsive regulation (examinations of retribution versus restoration in corporate criminal punishment).

In addition to his position at Australian National University, he has held a number of prestigious academic and professional appointments. These include a 2001 visiting research professorship in the law school at New York University, a visiting fellowship at the American Bar Foundation, 1988–94; directorship of the Australian Federation of Consumer Organizations, 1982–84; criminologist at the Australian Institute of Criminology, 1978–82; and a Fulbright postdoctoral fellowship and visiting lecturer in the University of California, Irvine, program in social ecology. He has also served as an officer or consultant to many government agencies, as well as on the editorial boards of several academic journals.

Braithwaite is the recipient of numerous academic awards and distinctions given by academic as well as practitioner-based organizations. His notable awards include the Donald R. Cressey Award for his contributions to white-collar crime education and prevention, given by the Association of Certified Fraud Examiners in 1988, and the Outstanding Scholarship Award of the Society for the Study of Social Problems, given in 1990 for his book *Crime, Shame and Reintegration*.

His research also related to white-collar crime has focused on the topics of corporate crime control, regulation, punishment, public policy, and compliance. His studies of industry-specific white-collar crime have focused on healthcare, including research on the nursing home and pharmaceutical industries. Apart from his distinguished research career, Braithwaite has been a valued mentor for aspiring criminologists.

## Brazil

BRAZIL IS A NATION mired in the white-collar crime of political corruption. The United Nation's Global Program Against Corruption defines corruption as the "abuse of power for private gain" and includes both the public and private sector. Although perceived differently from country to country, corruption tends to include the following behaviors: conflict of interest, embezzlement, fraud, bribery, political corruption, nepotism, sectarianism, and extortion.

The longest running story of political corruption involves former president Fernando Collor de Mello. An otherwise obscure governor of the state of Alagoas, he was propelled into the national scene single-handedly by the media giant TV Globo as its champion to defeat the Workers' Party candidate Luiz Inácio da Silva.

Upon securing the presidency, Collor de Mello apparently went on a binge of corrupt extortions through his adviser Paulo César Farias with barely any attempt to be subtle or secretive (namely, he made direct payments in the form of checks). In September 1992, Collor was impeached following a vote of 441 to 38 by the Chamber of Deputies of

the Brazilian legislature on charges of corruption. Collor, while maintaining his innocence, stepped down, allowing Vice-President Itamar Franco to become the country's acting president.

In December 1992, at the opening of his impeachment trial by the Brazilian Senate, Collor resigned as president of Brazil. The Senate convicted Collor of the corruption charges by a vote of 76 to 3. The verdict barred him from holding public office for a period of eight years. Collor also faced criminal prosecution stemming from the corruption charges.

Collor was acquitted of corruption by the Supreme Federal Tribunal on the grounds of insufficient evidence. Rosane Collor, wife of the president, was also convicted and sentenced in *abstentia* to 11 years in prison for corruption. In June 1996, Farias was found shot to death with this girlfriend in a beach house in Maceió, state of Alagoas, sometime before he was scheduled to testify in court about corruption during the Collor administration.

Such tales of high crimes are not limited to one presidential family. In 2002, presidential hopeful Roseana Sarney (daughter of a former president) abruptly discontinued her presidential campaign after a police raid on her company uncovered a mysterious \$558,000. Sarney had been running on an anti-corruption platform, and her various explanations of the money were unbelievable.

Corruption exists not just at high places in Brazil. On a daily basis, the media have no trouble finding dozens of stories of corrupt practices, ranging from high-level bureaucrats who accept bribes to award contracts or cut red tape, to political hacks who are paid for no-show government jobs, to minor functionaries who can expedite license and visa applications, to traffic policemen who can ignore traffic violations for a fee.

In a 2002 study, a survey was conducted of 5,312 persons between the ages of 12 to 64 years-old. The survey was done in nine major cities (Belo Horizonte, Brasilia, Curitiba, Fortaleza, Porto Alegre, Recife, Rio de Janeiro, Salvador, Sao Paulo) as well as the interior of Sao Paulo state and south/southeastern Brazil. During the survey, the respondents were shown a statement: "The first thing that the government needs to do is end corruption."

Of the respondents, 82 percent said that they "completely agreed" and 12 percent said they "somewhat agreed." No other issue (be it employ-

*The vast city of Sao Paulo, Brazil, with 10 million residents, contends with the effects of political corruption mixed with organized and violent crime in the country's major cities.*

ment, education, or national security) garnered as much support.

In Brazil, as in other countries, corruption breeds distrust of public institutions, undermines ethical principles by rewarding those willing and able to pay bribes, and perpetuates inequality. Individuals who wish to conduct their affairs fairly and honestly are demoralized and lose faith in the rule of law. Economic competition is distorted and public funds are squandered. As institutional and market reforms may lose credibility in the eyes of the public, processes of democratization (which should eventually reduce inequalities and improve transparency and accountability) lose momentum. Until the corruption issue is addressed, all other processes are ineffective.

## VIOLENT CRIME

The hazards of corruption in Brazil spill over into other criminal activities. In the 1990s and early 2000s, Brazil experienced levels of violence on par with those seen in Colombia and South Africa, two of the most violent societies on earth. The murder rates of the southern Brazilian states of Sao Paulo and Rio de Janeiro are four to five times higher than those in the United States.

The reason for such levels of violence, including instances of torture and summary executions, can be traced to the battle for drug profits and territories, pitting criminal gangs (narco-traffickers) against one another, and against certain corrupt segments of the police looking for a share of illegal profits.

Four national gangs currently dominate the country's drug underworld. Born in prison, they have established networks of affiliates and allies throughout the country. Moreover, they have transformed the country's prison system into their fiefdoms.

For many residents of impoverished areas, the gangs are a lesser of two evils given that they provide jobs, certain charity services, and sponsor social events such as dances and youth soccer, rather than the state's no-services and corruption. Although altruism plays a part in their social investments, the gangs' social contributions also buys the loyalty of many slum-dwellers. They are modern-day Robin Hoods, extremely popular in the slums where they make important investments, something the government rarely does. As a result, many slums are now no-entry zones for the government authorities, and are sometimes ringed by armed roadblocks.

The violence has steadily increased since the mid-1990s as the stakes grew larger and the weapons more powerful. Brazil is simply awash in weapons, and the narco-traffickers have endowed themselves with some of the most sophisticated small arms available. The problem is, certain segments of the police and military are more interested in the drug business than they are in law enforcement. As a result, some police have launched assaults against those who have refused to pay them protection.

## breast implants

THE INTRODUCTION OF silicone-gel implants in the early 1960s was a boon for manufacturers who accurately predicted a lucrative market, and for plastic surgeons who sought an effective and safe method to augment and replace breasts. Sales of the devices soared even as complaints of breakage and leakage began to emerge. Reports began surfacing in the mid-1980s that revealed a number of detrimental health effects which appeared to be directly associated with the silicone-gel breast implants.

After a long and heated battle over product safety, in 1992 the Food and Drug Administration (FDA) limited the use of silicone-gel breast implants to women who needed reconstructive surgery after mastectomies because of the high risk of possible health dangers. The debate over the marketing and safety of the devices continues as the FDA considered a 2002 application submitted by Inamed Corporation for approval to reintroduce silicone-gel implants.

### IMPLANT BACKGROUND

The history of the silicone-gel implant is convoluted and controversial. Dow Corning, based in Midland, Michigan, and a joint venture of Dow Chemical, introduced the silicone-gel implant to an unregulated market in 1963. Direct silicone injections, undergone by as many as 50,000 women, had been a popular method of breast enlargement until horror stories of blindness, gangrene, pneumonia, and even death promoted many state legislators to enact laws banning the practice. Dow Corning became involved in the practice through sales of in-

dustrial-grade silicone that was being sterilized and injected by doctors across the country. The company eventually was indicted by a federal grand jury in 1967 for shipping a non-approved drug three years earlier. Dow Corning, claiming to have no knowledge of what the silicone was being used for, pleaded no contest to the charges and paid a \$5,000 fine.

The legitimate marketing of silicone breast implants by Dow Corning was launched under the trade name Silastic. The new implants contained sealed silicone-gel in a sack of silicone sheeting that was designed to prevent fluid escape, maintain shape, and mimic the feel of actual breast tissue. Orders for the product flooded the company, and by 1967 an estimated 40,000 women had silicone breast implants. Product sales represented a billion-dollar business for Dow and five other corporations, particularly during the peak years for implants from 1979 to 1993. The Department of Health and Human Services estimated that by the early 1990s, one million women had silicone-gel breast implants, with the majority of cases involving elective augmentation surgery.

### IMPLANT EFFECTS

Consumer complaints that the implants were leaking, hardening, and rupturing continued to haunt the market. As early as 1982, physicians and researchers began to claim that the implants were associated with connective tissue diseases (CTD) and health problems connected to autoimmune disorders, including lupus, scleroderma, polymyalgia, and rheumatoid arthritis.

Many of the complications resulted in permanent disabilities and disfigurement. When silicone-gel implants ruptured, the surrounding tissue became infected with silicone and required extensive surgery. Between 1983 and 1991, the FDA received 5,000 implant-related complaints. Many consumers believed that manufacturers marketed the product without warnings of known risks and acted in bad faith.

Dow Corning was accused of withholding information on the long-term toxicity of silicone. Preliminary research by Dow showed that laboratory animals suffered from birth defects, nervous system disorders and even death as a result of the implants. A 1995 research study of 775 patients found that 91 percent of the polyurethane-coated silicone im-

plants on average had ruptured and 31 percent of the conventional silicone devices had ruptured. Internal memos from Dow Corning addressed the “bleeding” silicone problem and directed sales representative to clean any oil from the implant before showing it to prospective buyers. Corporate communications suggest that the company had been aware of leaks and ruptures since in the early 1970s and had manipulated the quality control records of the product. Finally, in 1985, package inserts included printed warnings of possible immune system diseases.

## REGULATION AND LAWSUITS

The U.S. government, despite mounting evidence, allowed the continued sales of the silicone-gel product. The implants were not regulated as medical devices until 1976 after the passage of the Medical Device Act, but the FDA allowed the manufacturing and sale of the implants without scientific research on safety since they were already on the market. In 1982, the classification for silicone implants changed to a more rigorous category that required information on the safety of the product. The FDA requested details from the manufacturers but allowed more than two years for the testing.

The first lawsuit against Dow Corning was filed by Maria Stern whose autoimmune disorder was said to be caused by her implants. The jury awarded her \$2 million in 1984 and the judge took note of the “corporate malice” by Dow Corning, and labeled the company’s behavior as “highly reprehensible.” Other lawsuit jury awards and out-of-court settlements followed. In 1991, Mariann Hopkins received \$840,000 in compensatory damages and \$6.5 million in punitive damages. Hopkins had silicone-gel breast replacements implanted in 1976 after a double mastectomy. She later developed a devastating immune disorder from the silicone exposure.

In the Hopkins case, the U.S. District Court found that Dow Chemical was guilty of fraud, malice, and oppression, however, the evidence from the trial, including internal memos from the company, was sealed by a court-issued protective order. In another case, Pamela Johnson’s suit resulted in a \$25 million verdict against Bristol-Myers Squibb. Baxter Healthcare was ordered to pay \$2.27 million to a woman whose implants ruptured.

By 1997, at least 748,000 claims had been filed by women who said the silicone-gel implants were

the cause of their illnesses. Also that year, a jury in New Orleans, in the first class-action lawsuit, found Dow liable for the dangerous implants and held that the company had purposely hid information that the silicone gel might cause harm.

The action was filed on behalf of 1,800 women in Louisiana who claimed that the silicone seepage caused immune system-related diseases. During the trial, Dow Chemical asserted that it never made or tested the implants, though the company owned 50 percent of Dow Corning. The plaintiffs argued that Dow Chemical performed toxicology tests on silicone in the 1940s and 1950s that showed the potential dangers of the chemical. The company claimed that the experiments were unrelated to implants and that scientists were testing the effect of industrial silicone on workers. The California State Supreme Court ruled that Dow Chemical could not be held liable for the harmful actions of Dow Corning.

In 1994, a \$4.25 billion class-action settlement was approved. Dow Corning sought Chapter 11 bankruptcy protection in 1995 in a self-protective move to avoid liability; though the sale of the implants represented only a small portion of company’s profits, the damage to its reputation was devastating. Three years later, the company offered \$3 billion to 177,000 claimants to settle the claims. The settlement agreement would compensate women based on the seriousness of injury, with a maximum compensate of \$300,000 for women who had severely debilitating diseases; up to \$5,000 for removal of the implants; and \$25,000 as compensation for ruptured implants. The litigation in these cases, including an estimated 13,000 lawsuits just against Dow, cost manufacturers billions of dollars and untold damage to corporate reputations.

The scientific evidence connecting silicone implants and CTD remains controversial and inconclusive. A 1996 research study at Harvard Medical School, partially funded by Dow Corning, found a “small but statistically significant increased risk” of immune-system illness. The data showed little hazard; in fact, of the 10,830 women who had received implants, only 231 reported that they had been diagnosed with CTD. More than 20 studies found no evidence that implants were linked to lupus, scleroderma, and other diseases. A 2000 study by the Institute of Medicine concluded that the silicone implants were not causally related to CTDs such as lupus and rheumatoid arthritis, though breast im-

plants can cause numerous localized problems from rupture. The study has been interpreted as a sign that the implants can be safely manufactured and in July 2003, the FDA began review of an application to re-approve silicone-gel implants, despite numerous protests from many women's groups. The application was denied in January 2004.

## Bre-X

**BRE-X MINERALS LTD.** was a small Canadian gold exploration company that committed the world's biggest mineral stock fraud in history. Bre-X became the star of investors in the gold industry after it announced a major gold deposit discovery, perhaps the largest ever discovered, in properties it was mining in the Busang area on the island of Borneo in East Kalimantan, Indonesia. It was later discovered that little, if any, gold was actually found in these properties. Some people, including insiders, became quite wealthy from the stock-play. The Bre-X fraud has been the subject of at least six books published about the scandal.

The Bre-X tale began in 1993, when David Walsh, a veteran stock promoter, traveled to Indonesia and met John B. Felderhof, a well-known geologist, who convinced Walsh to bet his company on Busang. In August 1993, Bre-X began to explore in the Busang area, and was reporting favorable drill results.

By early 1997, it claimed to have proven the existence of 71 million ounces of gold, worth about \$25 billion, and estimated that there was at least 200 million ounces present at Busang. As a result, the

Bre-X stock rose so high that it qualified for inclusion in the TSE 300, which caused index funds and all portfolios tracking the index to purchase the stock. To produce such a huge deposit, the Indonesia government required that Bre-X share some of the fortunate excess with the people of Indonesia, and with Barrick, a firm tied to Indonesian leader Suharto's ambitious daughter Siti Rukmana.

#### NO DEAL

But Barrick could not negotiate a deal acceptable to all parties. With Suharto's close confidant Mohamad "Bob" Hasan stepping in with the deal, the American firm Freeport-McMoRan Copper & Gold was eventually selected as Bre-X's partner in the Busang project. Freeport first undertook its own due-diligence drilling and reported that its analyses of seven core samples "indicate insignificant amounts of gold." That news came one week after the announced death of Bre-X's chief geologist Michael de Guzman, who reportedly fell to his death from a helicopter while traveling to Busang to meet with Freeport's due diligence team to discuss Freeport's assay results. Forensic Investigative Associates conducted an independent investigation into the scam and concluded that the company had "improved" the samples from the time they were collected until they were turned over to a down-river lab for analysis. Forensic Associates believed Walsh (and the other Canadian employees) did not know about the samples. The next day, the \$6 billion (Canadian) Bre-X stock lost almost all of its value.

An independent company, Strathcona Mineral Consultants, was commissioned to conduct an independent study of the situation. After their study, Strathcona concluded that "an economic gold deposit has not been identified in the South East Zone of the Busang property, and is unlikely to be."

Prior to the disclosure of the truth, Walsh and Felderhof sold large amounts of their personal stock in Bre-X, reaping millions of dollars for their own benefit and at the expense of Bre-X investors, who lost about \$3 billion when the scam was revealed in the spring of 1997. This incident caused a massive shattering of investor confidence and tarnished the reputation of the securities industry.

## bribery

BRIBERY OCCURS when something of value is improperly given to a public official in exchange for preferential treatment, or when officials use their position of power for personal gain. Bribes represent a corruption of a relationship of trust.

According to Transparency International, a non-governmental international organization devoted to combating corruption, bribery has several damaging effects. It undermines societal integrity, causes human rights abuses, corrupts democratic systems, discriminates against developing countries attempting to compete on a global scale, and disrupts free market operations. Within business, politics, and even within the criminal justice system, the offering of bribes has a long-established history to the point of being an institutionalized practice. The offering of bribes generally gives a distinct advantage over competitors by allowing an individual or organization to gain unfair benefits or avoid costs. Between 1994 and 1998, U.S. governmental officials found that bribes influenced 239 international contract competitions. Not surprisingly, the contracts were generally given to those who offered the bribes. In all, these 239 bribes accounted for \$108 billion.

Within the United States, laws and statutes have been enacted to deal with bribery of both domestic and foreign officials. Internationally, similar laws have been recently developed to combat international bribery of foreign and/or public officials. Traditionally, most bribery offenses in the United States have been settled under section 201 of Title 18.

Enacted in 1962, section 201 criminalizes both the behavior of those who give or offer a bribe as well as those who accept one. In addition, this statute addresses gratuities given to witnesses for in-

fluencing their testimony. Under section 201, bribery is defined as the exchange, offering, or promise of anything of value such as money or favors to a public official in order to corruptly influence a social policy or act.

The federal courts have ruled that "value" is not necessarily limited to commercial or financial value but can include a simply promise of future employment. In terms of public officials, the bribery statutes maintain that officials are anyone who perform some federal duty or possesses some level of responsibility under a federal program or policy. While the original rhetoric contained within the bribery statutes applied only to federal officials, by 1984 Congress extended these laws to include any state or local agent who received \$10,000 or more in federal funds. Under section 201, an official act involves any decision, matter, or action that is pending and which can be unduly influenced by a public official. Whenever an attempt is made to influence a public official to defraud the government, it is considered a corrupt act or bribe.

## INTERNATIONAL BRIBERY

While there is a long history of bribery of domestic public officials, not until after World War II as the move toward globalization took place, did U.S. statutes deal with the bribery of foreign officials. Advancements in technology and resources allowed economically developed countries like the United States to establish business relations with foreign countries. Within these foreign markets, American companies encountered an environment that encouraged the bribing of foreign officials in order to receive contracts, permits, and other business-related advantages.

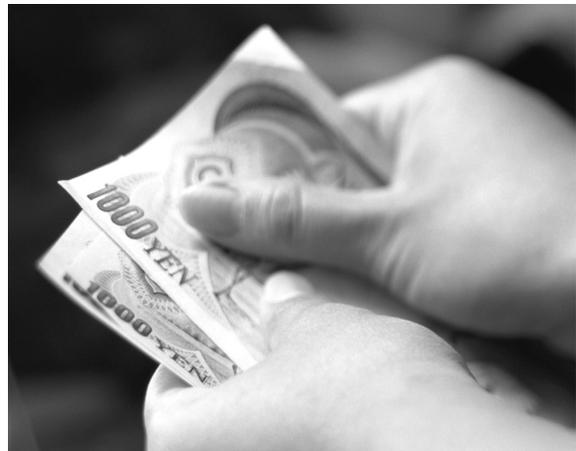

In an effort to criminalize bribe payments to foreign officials by American corporations and individuals, in 1977 Congress enacted the Foreign Corrupt Practices Act (FCPA). The FCPA provisions clearly specified that bribes occur whenever: 1) a domestic or foreign company or any U.S. citizen; 2) offer, promise, authorize, or deliver a payment of something of value; 3) to a foreign official, officials of a public international organization, political candidate, or political party; 4) within U.S. territories or to any American official outside the United States; 5) to corruptly induce or influence an official to act or refrain from acting or to gain any improper advantage; 6) to assist the company in

obtaining, retaining, or directing business to any other interested persons or parties. The FCPA guidelines also considered any knowledge of payments knowingly directed or made to third parties as an act of bribery. This provision was designed to encourage company officials to report any acts that may be considered a bribe or violation of FCPA policies. Thus, anyone with direct or indirect knowledge of bribes would be subject to criminal sanctions

One of the unintended consequences of the FCPA was that it left U.S. companies at a disadvantage in the international markets because their foreign competitors were not subject to the same aggressive legal guidelines. That is, foreign businesses were able to offer bribes without penalty since no criminal statutes existed in their own territories to sanction or punish bribery. By 1988, Congress amended the FCPA and urged the president to encourage American trading partners or members of the Organization of Economic Cooperation and Development (OECD) to pass anti-corruption laws to address fraudulent international business dealings. Founded on December 14, 1960 and based in Paris, France, the OECD was originally comprised of 20 countries, including 18 European countries, Canada, and the United States. In 2003, there were 30 OECD members comprised primarily by economically developed countries that house the majority of multinational corporations operating in the international markets.

From the perspective of the U.S. Congress, international corruption reduced fair competition, undermined economic development, and interfered with free business markets. In particular, Congress argued that bribery of foreign public officials produced unfair advantages to countries unrestricted by criminal statutes and regulation. Congress sought to extend the FCPA guidelines against bribery to foreign competitors or any country dealing in foreign markets.

To address U.S. concerns about international bribery, on November 21, 1997 the OECD adopted the Convention on Combating Bribery of Foreign Public Officials in International Business Transactions (OECD Convention). This convention made the bribery of foreign officials an international crime among 34 member countries. Similar to the guidelines of the U.S. FCPA, the convention states that the intentional offering, promise, or giving of money or something of value to a foreign official to

*Though illegal in the United States, the paying of bribes can be a way of doing business in other countries.*

obtain or retain an improper advantage is prohibited and shall be considered a bribe or violation of the convention statutes. Under the rhetoric of the convention, “foreign official” includes any person holding a legislative, administrative, or judicial office of a foreign country, any person exercising a public function for a foreign country, and any official or agent of a public international organization.

Article 1 of the convention also specifies that “improper advantage” refers to receiving gains that an individual or company would not otherwise receive or clearly not entitled to have. While the OECD Convention did not attempt to require strict uniformity or drastically change the legal system of every member nation, the guidelines set forth were intended to establish consistent international regulation of illegal business transactions such as bribes. Punishments or penalties require that countries be able to seize or confiscate the bribe and bribe proceeds and if countries are unable to meet such criteria then they should obtain monetary sanctions comparable to the bribes offered.

While the FCPA of 1977 helped to influence the OECD Convention guidelines, the OECD had a reciprocal affect on the 1998 amendments of the FCPA. Adopting similar OECD Convention stipulations, the 1998 FCPA amendments allowed U.S. attorneys to prosecute “any person” who commits bribery on U.S. territory.

Prior to this revision, only American individuals or companies that offered bribes could be prosecuted under the FCPA guidelines. Furthermore,

the 1998 amendments expanded the authority of the FCPA to include any person or entity offering or accepting bribes in territories outside the United States but that involved U.S. interests. In this way, the OECD influenced the FCPA by granting U.S. prosecutors greater authority to enforce any violations against bribery statutes.

## Brown Lung

**BROWN LUNG DISEASE** is a respiratory disorder associated with the processing of cotton, flax, hemp, or other fibers, and is common among textile workers. The term *Brown Lung* is often mistakenly used for either of two different diseases, according to the book *The Cotton Dust Papers*: "... Mill Fever, which is an acute response to the biologically active material—fungi, bacteria—in contaminated cotton, and byssinosis, which is related to the component of cotton dust emanating, it is believed, from the endotoxins of the cotton plant itself."

Although it was commonly called by different names, including Mill Fever, in different areas and times, this affliction was first recognized in the 1600s and was widely known in England and Europe 200 years later.

Until the relatively recent past, it was believed to be limited to European mills and foreign cotton. Americans with shortness of breath, sluggishness,

and asthma-like attacks were believed to be suffering from other afflictions.

In the early 1900s, following a series of autopsies which showed lung damage for which there was no apparent physical cause, Britain began researching the cause of the problem. After determining that the victims had worked in the dustiest part of textile mills, in 1941 the British Parliament began giving benefits to completely disabled victims who had at least 20 years' exposure to cotton dust.

#### HISTORY OF THE AFFLICTION

One of the earliest mentions of the affliction in the United States is an article published in 1940 in the trade journal *Textile World*. Other studies using different findings and methodologies were done in the 1940s. Following another British study, a rash of research was done in America from the 1950s through the 1980s. Brown Lung was not recognized as an official occupational hazard in the United States until 1977. At that time, only two American victims had won settlements from the lung disease.

As the harvest and ginning of cotton became more mechanized, the amount of contaminants in the cotton bales increased and Brown Lung became more prevalent. In 1981, estimates based on government and labor union studies indicated at least 20 percent of American textile mill workers had byssinosis from breathing in microscopic particles of leaves and stems coming from processing bales of raw cotton fiber.

Brown Lung was one of the health hazards which inspired the Occupational Safety and Health Act (OSHA) of 1970. This act allows the U.S. government to set standards to protect workers from substances that are toxic. Bureau of Labor statistics cited in the 1970 hearings showed almost 400,000 cases of occupational disease. It was in the 1970s that the name Brown Lung was coined. Credit for the phrase is given to Ralph Nader, who wrote a 1971 article which focused national attention.

Although state workers' compensation systems began in 1911, they did little to help victims of occupational diseases such as byssinosis. Even though the system was supposed to be no-fault, 90 percent of occupational lung-disease claims were contested well into the 1980s, and those that were won by the victims often took more than a year to settle. Part of the difficulty was that the burden of proof of disease was on the plaintiff to show she had contracted

the disease through her occupation. In the late 1970s, only about one-tenth of the (eventually) successful accident claims under workers' compensation was contested by employers. However, employers contested three-fifths of disease claims in general, and nine-tenths of the dust claims in particular during this same time period. These contested claims presented special difficulties for the claimants: Procedural points were especially hard-fought by both sides because so many of these points were setting precedents that would either help one side or the other in the next case. Moreover, the workplace had usually changed a great deal since the employee left, sometimes a period of years before. Access to these work sites was not always readily available, and sometimes there were indications of retribution against witnesses providing testimony for the plaintiff.

In 1980, the North Carolina Supreme Court extended the statute of limitations to one year after the victim had been notified by "competent medical authority" that she had byssinosis. By August 1981, 707 claimants had been awarded \$8.01 million. 1981 brought a decision by the North Carolina Supreme Court that textile workers were only entitled to partial compensation for byssinosis if their condition stemmed partly from causes other than exposure to cotton dust.

In June 1981, the U.S. Supreme Court, in a 5-3 decision, ruled that the OSHA does not require government regulators to consider the costs to industries when mandating compliance with standards. The American Textile Manufacturers Institute and 12 textile companies had filed suit against OSHA, stating that the required dust-level standards were too strict. The plaintiffs claimed that the air-filtration systems required to meet the new standard would cause them unreasonable costs and might drive small textile companies out of business. The manufacturers' attorneys further argued, without success, that according to the 1970 law, OSHA had to assure that the health regulations benefits had a reasonable ratio to the compliance cost, but the cost/benefit relationship of this standard did not.

Interestingly, the equipment which textile manufacturers installed in order to comply with the Supreme Court's ruling ultimately improved the productivity of the factories and the quality of the products, as well as reduced the amount of harmful cotton dust to which the workers were exposed.

By June 1987, 3,416 worker compensation claims had been filed in North Carolina, with 1,835 of these winning settlements or awards totaling \$30 million. Although South Carolina did not keep figures, the Brown Lung Association, an advocacy group for textile respiratory victims, estimated 350 cases had been filed in that state through 1982 with 180 winning about \$3.5 million.

Even though state workers' compensation systems had disbursed millions of dollars to settle byssinosis claims by the early 1990s, that was only a small part of the cost to the victims, and relatively few actually received these benefits. Many were denied, did not file, or died before they could be awarded compensation.

## Buffalo Creek

THE DAM BROKE SHORTLY after 8:00 on a Saturday morning. On February 26, 1972, a wall of mining waste and water estimated at 30- to 50-foot-high roared down Logan County's Buffalo Hollow and through the West Virginia villages of Lorado, Riley, Braeholm, Accoville, Pardee, and Man.

Down the 17-mile valley poured 130 million gallons of water, sludge, cars, houses, trees, bodies, and more. When it was over, 80 percent of the 2,200 homes in the valley were gone or uninhabitable,

thousands of people were homeless, many lost all their possessions, 16 communities were destroyed, and 125 people were killed.

Pittston Coal Company bought the dam in 1970 and continued the common practice of piling mine refuse, mostly coarse coal fragments and shale, across valleys to get rid of the waste and provide settling ponds for water purification. The water level of the mile-long body of acidic water behind the dam had been alarmingly high after three days of heavy rain combined with melting snow. According to William Davies, the U.S. Geological Survey geologist investigating the disaster, the company decided to cut a spillway through the top to try to increase the dam's stability. Unfortunately this weakened the dam instead, and released 20 million cubic feet of thick, sludgy water that raced down the valley at speeds of nearly 30 miles-per-hour. It was weeks before all the bodies were found, some of them miles downstream.

Investigation into the causes of the flood, one of the worst coal-mining disasters in U.S. history, brought allegations of faulty construction of the dam, including violation of several state and federal building codes. Officials were accused of not showing the dam on maps given to the West Virginia Mines Department. Also accused of unwittingly contributing was the Bureau of Mines which failed to enforce federal prohibition against refuse banks, and the West Virginia Public Service Commission which did not enforce dam-construction permit laws. A special Logan County grand jury, however, decided that no criminal charges should be brought against these parties.

Reporting that they still faced feelings of guilt, nightmares, and other terrors, survivors sued the Pittston Company, asking for recompense for "psychic impairment" as well as property loss. Pittston Coal representatives, almost immediately after the disaster, had claimed the flood was an "act of God" and therefore not the company's responsibility. However, an out-of-court settlement in 1972 provided 625 adult survivors \$13,500,000. A class-action suit was also filed against Pittston Company on behalf of 348 children who survived the Buffalo Creek flood. In June 1974, this suit was settled out of court for \$4,800,000. Presiding U.S. District Judge John Copenhaver, Jr., ruled that five children in utero at the time of the flood should share in the settlement because of an indication by medical evidence that unborn children could be affected by

psychological trauma. Other survivors settled with the company independently.

Before leaving office in 1977, the West Virginia governor, Arch Alfred Moore, Jr., signed a settlement with Pittston for the coal-mining company to pay West Virginia \$1 million for clean-up costs resulting from the flood. In 1987, the U.S. Supreme Court required West Virginia to pay the U.S. Army Corps of Engineers \$10 million, including \$5.8 million in interest, for clean-up and relief efforts by the U.S. Army Corps of Engineers following the Buffalo Creek flood.

A further response to this tragedy was a 1977 federal law requiring thousands of acres of strip-mined land be returned to its original contour when the mining was finished. Unfortunately, mountain-top removal is specifically exempted.

## Bush, George H. W. (1924–)

AS A YOUNG MAN, George Herbert Walker Bush, the future 41st president of the United States, served in the U.S. Navy during World War II as a pilot before entering college. Like his father Prescott, Bush attended Yale University and was a member of an elite society, Skull and Bones.

Bush began his political career in the 1960s, serving two terms as a representative from Texas before holding various high-level positions within the federal government including: ambassador to the United Nations, chairman of the Republican Na-

tional Committee, chief of the U.S. Liaison Office to China, and director of the Central Intelligence Agency (CIA).

Focusing on Bush's public record in white-collar crime, numerous examples can be found to illustrate Bush's alleged involvement in crimes ranging from political assassination to software piracy. It should be noted Bush's involvement in such crimes may, by no means, be unique to his presidency. An equally damaging, if not similar, report could be presented for many elite leaders and presidents. But it is Bush's unique background, and avoidance of culpability, that illustrates specific criminal cases. For example, as CIA director, Bush maintained a policy of disinformation and secrecy. Under Bush, the CIA participated in such crimes as drug-trafficking and organized assassinations. One of these assassinations took place in September 1976 when Chilean dissident leader Orlando Letelier was killed by a car bomb in Washington, D.C. Under Bush, the CIA submitted a false report on the assassination of Letelier that deliberately misled the FBI investigation. Twenty-four years later, in September 2000, a report to Congress revealed that the mastermind of the assassination was a Chilean intelligence chief, who was later found to be a paid asset of the CIA under Bush.

Bush was elected vice president in 1980, and regularly received key intelligence information while attending President Ronald Reagan daily security briefings and cabinet meetings. This high level of involvement proved damaging for Bush when the Iran-Contra scandal surfaced in 1986, involving illegal funding of anti-communist rebels, the Contras in Nicaragua. An independent-counsel investigation failed to reveal the extent of Bush's involvement in the Iran-Contra scandal, and could not derive enough evidence to indict him. Bush's interference with the investigation, coupled with his violations of non-enforceable statutes protected him from indictment.

## PANAMA

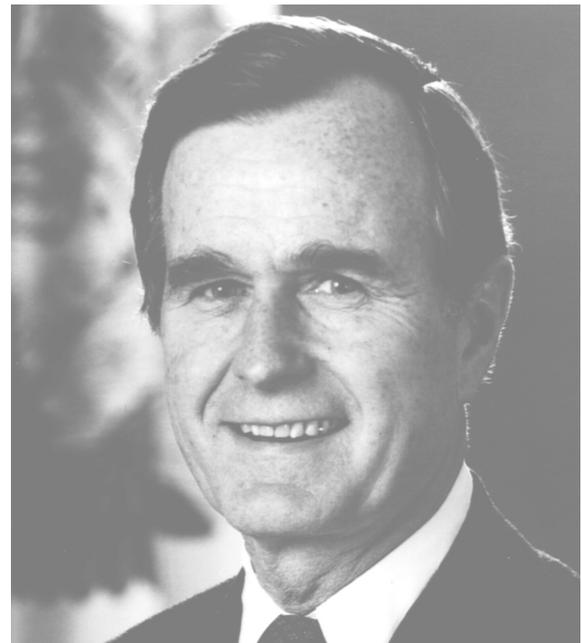

In December 1989, 12 months after being inaugurated president, Bush ordered the invasion of Panama to depose the Panamanian leader General Manuel Noriega, who was a drug-trafficker and dictator. The true reasons behind the invasion are more complex in nature. Noriega had a long history of working for the U.S. government, and for Bush.

Bush worked with Noriega during his vice-presidency in the 1980s. During the Iran-Contra scandal, Noriega was paid over \$100,000 a year by the CIA for using his drug trade as a means of supplying arms to the U.S.-backed Contras. The revelation of Bush's criminal relationship with Noriega was a crucial factor concerning the invasion of Panama.

The attack in Panama began with a massive aerial bombardment that struck both military and civilian targets. After the attack, the press and the Red Cross were prevented from entering the heavily bombed areas as U.S. military personnel incinerated and buried civilian remains. The Bush administration allegedly attempted to hide the true number of casualties inflicted in the attack, and reported a death toll of 500 to 600 individuals. However, some independent rights groups, such as the Panamanian National Human Rights Commission, estimated that 3,000 to 5,000 people were killed, and that another 25,000 people were left homeless.

## INSLAW

The Inslaw scandal began in the mid 1980s and involved the Department of Justice (DOJ) allegedly

*George H. W. Bush holds a unique record of alleged white-collar crime in his CIA and presidential legacy.*

stealing Inslaw Inc.'s PROMIS database management software, and then using it without a license. The Inslaw Company began a futile legal battle in an attempt to prove that the DOJ had appropriated the PROMIS software fraudulently. This litigation resulted in the bankruptcy of Inslaw and the validation of the government use of PROMIS.

The DOJ proceeded to use the software to create the infrastructure of the entire U.S. intelligence community. However, the true scandal concerning Inslaw software occurred when a "trapdoor" was created by the CIA and integrated into PROMIS software. The illegitimate software was then sold to foreign governments, intelligence, and police agencies. With the trapdoor modification, PROMIS had the potential to be an unprecedented global espionage tool.

The amount of harm caused by the Inslaw scandal may never surface due to the lack of hard evidence concerning the government use of PROMIS. In 1991, an investigative writer, Danny Casolaro, claimed to have "cracked" the Inslaw scandal and was compiling his final pieces of evidence on the subject. A short time after, Casolaro was mysteriously found dead in a hotel room and his documents and evidence concerning Inslaw were never recovered. The official investigation claimed that Casolaro had committed suicide; interestingly, the local police and the DOJ are still withholding information (as of early 2004) about the investigation.

## IRAN-CONTRA PARDONS

Bill Clinton defeated Bush in the 1992 presidential election. Before leaving office, on December 24, 1992, Bush pardoned Casper W. Weinberger, Duane R. Clarridge, Clair E. George, Elliott Abrams, Alan D. Fiers Jr., and Robert C. McFarlane, all of whom were involved in the Iran-Contra scandal. George, Abrams, Fiers, and McFarlane were pardoned after being convicted under such crimes as: felony and misdemeanor counts of withholding information from Congress, perjury, false statement, and obstruction in connection with a Congressional grand jury investigation. Clarridge and Weinberger were indicted and awaiting trial when they received rare pretrial pardons from Bush. Joseph F. Fernandez, another individual who was indicted in the Iran-Contra scandal, was protected from prosecution. The Bush administration refused to release classified information concerning Fernan-

dez's involvement with the scandal, leading to the dismissal of his case.

DAVID R. SIMON

SAMUEL DE LUCA

UNIVERSITY OF NORTH FLORIDA

## Bush, George W. (1946–)

SCANDALS HAVE become common occurrences regarding presidential administrations, but in the case of the 43rd president of the United States, one would have to look back to 1876 with the appointment of Rutherford B. Hayes to find a president so quickly surrounded with scrutiny. Even before George W. Bush became president, his administration was already shrouded with a scandalous stigma surrounding the contested presidential election results from voting irregularities on November 7, 2000.

The entire election rested on the outcome of the state of Florida, whose voting process was so flawed that it would take 33 days until Bush was awarded the victory. However, while Bush was the winner, the entire country was the victim of dubi-

ous Supreme Court rulings that effectively chose the president for the public. In addition, the voters of Florida were victimized by Choicepoint, a company hired by the state of Florida to determine who was ineligible to take part in the election due to having a felony charge on her record. The problem with Choicepoint was that it erred badly in its determinations of who could not vote. Bush's election provides an unparalleled and alarming example of how possible corporate fraud or negligence can mix with politics and affect the election of a president.

### VOTER DISCRIMINATION

The earliest problems surrounding the election between Republican Bush and Democrat Al Gore began with the hiring of Database Technologies (DBT) by Florida Secretary of State Katherine Harris, a Republican. DBT is based in Florida, and is a smaller division of Choicepoint. It was the job of Harris and DBT to go through the eligible voters list in Florida and determine if anyone was ineligible to vote, and if they came across someone who was not eligible, then they removed the person's voting rights.

At the time of the election, Florida state law prohibited convicted felons from voting. The problem with the list of people who had their voting rights taken away was that thousands of them were legally entitled to vote, yet were prevented. What adds to this embarrassment is that most of the voters who lost their rights were minorities in historically democratic counties who would have overwhelmingly voted for Gore. Over 90 percent of African-Americans who voted in the election voted for Gore.

According to acclaimed British BBC television journalist Greg Palast, Harris removed 57,700 names from the registered voters list, meaning that those names could not vote. In addition, 8,000 other names gathered by DBT were removed on the basis of having felony charges. However, these 8,000 names were not convicted felons, but rather were convicted of misdemeanor crimes, which would not prevent them from voting. Palast traced the bogus list to its originators, which were state officials from Texas who sold the list to Choicepoint.

The list of 8,000 names were predominately minority voters, as well as poor white voters, all of whom statistically voted Democrat. Following this admitted mistake, DBT and Harris came forth with

the before-mentioned list of 57,700 ineligible voters. Again, the basis of this list was that these people were convicted felons.

Following the election, Palast went through the list, discovering that 90 percent of the people on the list were actually entitled to vote and had never committed a felony. What was striking about so many people on this list (who were incidentally predominantly black voters), was that DBT had removed all voters who shared similar names to convicted felons of the same minority race. For example, a person sharing the same name as someone convicted of a felony crime, in the case that both were minorities, would have all of her voting rights removed by DBT, regardless of whether she was ineligible to vote or not. Critics pointed out DBT should have done more thorough research to determine which individual was ineligible to vote, but the company refrained from this procedure.

In total, allegations said over 90,000 people who should have been allowed to vote were prevented from voting due to DBT, mostly African-Americans and Hispanics, and all predominantly Democrats. On April 17, 2001, ChoicePoint Vice President James Lee went before Congress and admitted that ChoicePoint and DBT were only following the orders from the state of Florida, which included eliminating voters whose names matched 80 percent of that of a convicted felon's name. Since the lists handed to the DBT included a persons race, it made it all the easier to discriminate against minority or Democratic voters. When Bush was declared the victor, it was by a total of 537 Florida votes. In total, 5.8 million people voted in the state of Florida, and over 200,000 predominantly minority voters either saw their voting rights blocked or their votes not counted.

### SUPREME COURT PRECEDENCE

The Supreme Court ultimately decided that Bush was the rightful winner of the election. In a 5-4 decision, split along party lines, the justices ruled to stop the recount on December 9, 2000, at 2:20 P.M. as Gore had cut the lead down to only those 537 votes. There are two significant points regarding the Supreme Court's decision to intervene in the election. The first is that since it is the responsibility of the states to enforce their elections under state law, it is also the responsibility and duty of the state courts to make any necessary rulings on electoral

procedures. Second, the argument brought forth by the Bush team that a manual recount would violate the 14th Amendment did not follow any court precedence.

In making the claim that the 14th Amendment was being violated, the Bush team would have to prove that irreparable harm would be caused to the Florida voters by continuing the manual recount. This irreparable harm was never proven, and was rather strongly opposed since there was such a large proportion of Florida voters who wanted a recount because they felt that their votes had not been counted. In addition, the fact that Bush raises the 14th Amendment as a defense is inapplicable because he was not a Florida voter. Bush was not irreparably harmed by a manual recount. Ultimately, Bush made this claim on behalf of the Florida voters; no Florida voter raised the allegation.

The Equal Protection Clause claims that a person can only raise a violation of the 14th Amendment if he has been victimized, and since Bush was clearly not a Florida voter, his claim should have had no standing. The court cited a 1966 case, *Harper v. Virginia Board of Electors*, which stated that by striking down a poll tax that had prevented poor blacks from voting, it was not discriminating against voters, but rather allowing more to vote. In *Bush v. Gore*, the court cited this case while it subsequently denied tens of thousands of minority voters the right to vote.

The fact that the Supreme Court found merit to use the case in favor of Florida voters who never made the claim, raises questions of whether there were personal agendas behind the justices' ruling. Justice Sandra Day O'Connor had told the *Wall Street Journal* prior to the election that she wished to retire but would not do so with a Democratic president in office, revealing that she had much to lose if Gore won the election. In addition, Justice Antonin Scalia had two sons working on behalf of the Bush team. Bush was awarded the presidency on December 12, but for many people, the presidency was handed to him by a party-biased majority of the Supreme Court.

## THE ENRON COLLAPSE

Corporate crime also mixes with politics in the case of campaign finance. During Bush's election campaign, Kenneth Lay, known affectionately as Kenny Boy to Bush when he was governor of Texas, was

one of Bush's primary campaign fundraisers. The former Chief Executive Officer of Enron donated \$1.75 million to the Bush campaign over the years, and in return, Enron received many presidential perks. Former Enron personnel were appointed to the Bush administration, including Army Secretary Thomas White and U.S. Trade Representative Robert Zoellick.

Thirty-five members of the Bush administration held or had held Enron stock. Vice President Dick Cheney drafted his energy policy after talks with Enron officials, and in addition, Pat Wood, a man strongly supported by Lay, was chosen to be the president's top energy-price regulator.

Unfortunately for Enron, its share price faced a steep decline from January 2001 to January 2002. On August 20 and 21, 2001, Lay sold 93,000 of his personal Enron shares, earning him \$2 million. As Lay sold, he encouraged outside shareholders to continue to buy Enron, insisting that the growing doubts circulating about the company were untrue. On December 2, 2001, Enron applied for bankruptcy. The Federal Bureau of Investigation entered Enron headquarters in January 2002 after it was discovered that Enron was shredding documents. The Enron collapse was the biggest corporate collapse in the history of the United States at the time.

As Bush prepared for his State of the Union address, it became clear that he and his administration had deep ties to Enron. However, not even this close relationship could save Lay and Enron from investigation, and the president (wisely, some would say) made no sign to help Lay or Enron. Rather, the president was trying to distance himself as far as he could from the scandal. The real losers of the Enron collapse were the outside stockholders, those who had no idea that the company was faltering and were intentionally and deliberately misled. These stockholders lost life savings and many lost their jobs as Enron went bankrupt.

While Enron's donations undoubtedly bought the company many advantages with the Bush administration, perhaps its greatest asset was the fact that members of the Bush administration, including the president himself, remained silent during the fatal collapse of the company, meaning the certain demise for the outside shareholders. The Bush administration admitted on January 17, 2002, that it had conducted a review of Enron's problems in October 2001, while the company was heading quickly toward bankruptcy.

## Butcher brothers

In 1976, Jacob F. "Jake" Butcher and his younger brother Cecil Hilque "C. H. Jr." Butcher, Jr., created Tennessee and Kentucky banking operations worth almost \$1 billion. Nine years later these high-living bankers were incarcerated following federal convictions related to various fraudulent practices in their banking empire.

With the exception of one credit life company, the brothers' holdings were held separately. They did fund their purchases similarly: When they could, the Butcher brothers financed their bank acquisitions by getting the seller to finance the purchase. When that was not possible, they borrowed the money from a larger bank. At their peak, the two brothers owned or controlled almost 40 banks with approximately \$3 billion in assets.

The Butchers' banking empire began to crumble January 19, 1983 with a cease-and-desist order from the Federal Deposit Insurance Corporation (FDIC) against Jake's United American Bank (UAB) of Knoxville, Tennessee. That order and another the following month accused the bank of issuing false and misleading information regarding the bank's condition, and directed it to correct its 1982 financial statements and the information the bank provided.

The bank was declared to be insolvent on February 14, sold to the state's largest bank holding company, and reopened the following day as First Tennessee Bank of Knoxville. The failure of UAB Knoxville was the nation's third-largest.

Several of C. H. Jr.'s banks faced runs by depositors after the February close and sale of UAB, and his finance company, Southern Industrial Banking Corporation, filed for bankruptcy in March. Following regulatory pressure to support his banks, April 1983 brought the sale of most of C. H. Jr.'s banking interests. In May, the FDIC arranged for the sale of five more of the Butcher Tennessee banks, creating the single biggest day of bank closings since the Depression. Between February 14 and August 26, 1983, nine banks owned by the Butcher family failed and 11 others in which they had interest or association were sold or merged.

Banks owned or controlled by the Butchers, or their friends, made loans to individuals and other banks which exceeded the amounts allowed by law, as well as by good business standards. In some cases, collateral offered was over-stated in value, in one case by 100 times the purchase price of the collateral. The Butchers and their associates also set up companies under different names, and took out loans from Tennessee and Kentucky banks without telling the bank officers that the same people were affiliated with these companies and would be getting the proceeds from more than one loan.

Butcher-owned or -managed banks were found to be making loans without adequate documentation, collateral, or consideration of the credit-worthiness of the borrower. Excessive loans were also made to the Butchers, bank directors, and their associates and friends. The banks then traded the loans back and forth among other banks controlled by Jake and C. H. Jr. to make it harder for bank examiners to discover the hidden accounting problems.

Along with the fact that loans were shuffled from one bank to another, state regulators had difficulty discovering irregularities and fraud for other reasons: The geographic area covered by these banks was included in two FDIC regions and three Federal Reserve Districts. Short staffing was another problem; in 1983 Kentucky only had 33 examiners responsible for 263 state-chartered banks, and Tennessee had 38 examiners for 281 state-chartered banks.

Losses from the failures of United American Bank of Knoxville and other Butcher banks cost the FDIC approximately \$1.1 billion, perhaps the most costly bank collapse in the nation's history to date. The FDIC reimburses depository customers up to \$100,000 each, but does not reimburse people

for losses on their shares. The Butcher brothers were bank shareholders.

#### THE BUTCHER CONVICTIONS

In June 1983, the FDIC and two banks filed a bankruptcy petition against Jake who had been an unsuccessful candidate for governor of Tennessee in 1974 and 1978, and chairman of the 1982 World's Fair in Knoxville. Jake was indicted on several charges in 1984, and on April 22, 1985, in a plea agreement, Jake pleaded guilty to 20 of 92 counts of bank fraud, and four of nine counts of conspiracy. He also pleaded guilty to tax charges related to failing to report \$38.5 million in income. In June and July 1985, Jake was sentenced to five 20-year prison sentences, to be served concurrently, on the fraud and conspiracy charges. The sentence ensured he would be required to serve at least one-third of the sentence before being eligible for parole. He was also sentenced to 14 years imprisonment for tax evasion. If convicted of all charges Jake could have been sentenced to penalties of up to 501 years imprisonment and \$436,000. He was paroled in 1992.

By June 1983, a lawsuit was filed to force C. H. Jr. into involuntary bankruptcy because of \$13.4 million in overdue loans to three banks and the FDIC. In August 1986, he was found innocent of 25 counts of fraud in conjunction with the failure of his Southern Industrial Banking Corporation. If convicted on all of these charges, he could have been sentenced to 115 years imprisonment and

finest of \$25,000. In April 1987, C. H. Jr. pleaded guilty to two counts of conspiracy, four counts of bankruptcy fraud, and four counts of bank fraud. C. H. Jr. served 6 years of a 20-year sentence. He was paroled in 1993 and five years later placed on probation which was to end in 2003. In 1999, C. H. Jr. paid off his \$319,019 criminal fine. He died April 30, 2002.

## campaign finance

THE MOTTO of the animals in George Orwell's *Animal Farm* is "All animals are equal, but some animals are more equal than others." The irony, of course, stems from the fact that the animals started out trying to establish a completely equal system, but they failed miserably. The same can be said of campaign finance.

Reforms are generally aimed at the equality of voters, but the reality of campaign finance is that huge corporations and high-spending individual contributors have always been "more equal" than other voters. In addition to voter equality, campaign finance laws have been directed at stemming the rise of corruption. As a rule, efforts at campaign finance, like the efforts of George Orwell's animals, have failed miserably. After each attempt at reform, a new loophole seems to open up, and the result is almost always further inequality of voters and new methods of political corruption.

Elected officials are almost always campaigning. Terms of office at the national level were staggered by the framers who wrote the U.S. Constitution in an effort to guarantee stability. Even though the president does not have to face re-election for four years, campaign strategy and finance for the next election start almost immediately after an election, since both the president's party and the opposition

party must plan for the off-year elections that are only two years away. Every two years, the entire House of Representatives must face re-election, as well as one-third of the Senate, and many states hold elections at the same time. As soon as the off-year elections are over, the focus returns to the next presidential election two years later when, in addition to the president and vice president, all members of the House and another one-third of the Senate will be elected, and the cycle of campaign financing begins again. As a result, politicians are always conscious of the next election and must be constantly aware of how much money might be needed to finance the campaign. It has become a fact of life in contemporary American politics that the candidate who spends the most money generally wins an election.

## ONE PERSON, ONE VOTE

The concept of one-person-one-vote was guaranteed by the Supreme Court in three separate cases in the 1960s: *Baker v. Carr*, 369 U.S. 186 (1962), which applied the concept of one-person-one-vote to state house seats; *Reynolds v. Sims*, 377 U.S. 533 (1964), which applied the concept to state senate seats; and *Wesberry v. Sanders*, 376 U.S. 1 (1964), which applied the concept to seats in the U.S. House of Representatives. The whole concept of

one-person-one-vote has serious implications for campaign finance because there is little doubt that individuals and groups that contribute large amounts to political candidates have historically sought some sort of return on their investment.

Abraham Lincoln defined democracy as “government by the people, for the people, and of the people.” If Lincoln’s interpretation is correct, then a basic concept of democracy is the right of the American voter to select candidates based on free access to information. Unfortunately, there is no requirement that the information be truthful. Throughout history, the American voter has been deluged with campaign rhetoric that paints the other candidate as incompetent, irresponsible, or corrupt. Since television entered the scene in the early 1950s, political campaigns have become increasingly sophisticated and more manipulative.

Political candidates are “packaged” in the same way that products are, and with the same intention: to convince the consumer (voter) how much better off she is with the product (candidate) in the ad. Ronald Reagan, for instance, hired Madison Avenue advertisers to package his 1980 campaign against the Democratic incumbent, Jimmy Carter. Candidates are usually presented to the public either through spot ads of up to 60 seconds or through short issue messages, which may last as long as five minutes. Television advertising is expensive, making up the largest part of budgets for political candidates. Since these costs rise with every election, candidates’ teams are always on the lookout for ways to make more money. This is particularly true when elections are hotly contested. For example, the 1996 Georgia election in which Speaker of the House Newt Gingrich was fighting for his political life cost a total of \$56,852,466.

## HISTORY OF CAMPAIGN FINANCE

The first American campaign finance law was passed even before the American Revolution when the Virginia House of Burgesses prohibited politicians from winning votes through bribery. It was common practice in the early days of American history for politicians to pay voters or to grant them favors in exchange for votes. The party machines were notorious for such practices.

In 1867, Congress passed a naval appropriations bill that banned politicians from pressuring workers in navy shipyards to contribute to political cam-

paigns. Thirteen years later, the Civil Service Reform Act of 1883 brought employees of the Civil Service into the protected class, exempting them from political pressure. By the beginning of the 20th century, reformers had recognized the fact that allowing wealthy donors to give unlimited contributions paved the way for political corruption and inequality of votes. President Teddy Roosevelt was one of the first to call for a ban on this activity.

Congress passed the first campaign finance laws of the 20th century in 1907, 1911, and 1915. Although a weak campaign finance bill was later passed, which placed a ceiling of \$5,000 on individual campaign contributions, restrictions were rarely enforced. The status quo generally prevailed for the next three decades. By the 1960s, campaign finance was rife with political corruption and pressure politics, and campaign contributions were being received from a variety of questionable sources. Political scientists and various reformers insisted that major campaign finance reform was needed to protect the democratic system, and the next decade widened the demand to such a point that Congress and state legislatures were forced to act.

In 1970, a limited campaign finance law passed Congress, but President Richard Nixon vetoed the bill. He blamed Congress for not going far enough in reforming current laws and promised support if the bill were expanded to more accurately meet the goals of campaign finance reform. The following year, Common Cause, an active citizens’ lobby, brought suit against both the Democratic and Republican parties, arguing that the Federal Campaign Practices Act of 1925 was being ignored. In response, Congress recognized the need for immediate action, and the result of that was the 1971 passage of the first Federal Election Campaign Act (FECA).

## REPERCUSSIONS OF FECA

Nixon was seeking re-election in April 1972 when FECA was set to take effect. As part of his re-election efforts, Nixon had established the Committee to Re-elect the President (CREEP) under the leadership of Maurice Stans and Herbert Kalmbach. At one point, CREEP was reportedly raking in amounts as large as \$100,000 per day. Some of this money was coming from questionable sources such as donors with less than sterling reputations and foreign donors who would not, or should not be

identified. CREEP also used the grace period before FECA took effect to pressure large corporations into substantial donations.

No one at CREEP paid any attention to existing campaign law that required disclosure of large donations. Common Cause, however, had not forgotten, and in September the group sued CREEP under the Corrupt Practices Act for failure to report campaign contributions before FECA took effect on April 7. Unfortunately for Nixon and CREEP, they were forced to make their secret list of donors public. Matters were further complicated for Nixon and his re-election team by the growing scandal concerning the break-in of the Democratic National Committee office at the Watergate Hotel on June 17. In the two years that followed, the Watergate investigation revealed the ugly secrets of CREEP, including money-laundering schemes and a host of other illegal practices.

On August 9, 1974, Nixon became the first president in the history of the United States to resign from office. In the meantime, some members of his re-election team and a number of his closest political advisors had been sent to prison for various abuses of power or on other charges. Congress reacted to the abuses of the Watergate scandal by regaining control of the legislative process and went through a period of refusing to follow presidential proposals for Congressional action. Subsequent versions of FECA strengthened and amended the law to further encourage open political competition, which involved the public more directly in financing political campaigns, and restricted the ability of large campaign donors to demand favors.

## FEDERAL ELECTION CAMPAIGN ACT

The main provisions of FECA established requirements for reporting the names of contributors and the amounts of donations and campaign expenses, restricted the amounts of donations, created a method of public funding, and established an oversight board. Before FECA was set to take effect on April 7, 1972, federal politicians scurried to build huge campaign chests before they were required to meet FECA restrictions on donations and to release campaign finance information to the public.

*Disclosure.* FECA stipulates that political parties and Political Action Committees (PACs) must provide periodic reports of campaign contributions and expenditures. All individual contributions of

more than \$200 in a calendar year must be reported, as well as all expenditures of more than \$200 a year.

*Contribution restrictions.* FECA places a \$1,000 limit per candidate per election for each adult. Primaries and general elections are considered separate elections. Individuals may give up to \$5,000 per election to a PAC or to state party committees. FECA restricts contributions to national party committees to \$20,000 per election. Corporations, labor unions, federal government contractors, and foreign nationals are prohibited from contributing to federal campaigns.

No individual can contribute more than \$100 in cash to any federal candidate for political office, and no one can contribute campaign money in someone else's name. "Soft money" contributions by individuals, groups, unions, Political Action Committees (PACs), and corporations to the party committees, which bypass the restrictions of FECA, are unlimited. Individual donors and PACs may spend as much as their own money as they choose on "issue advocacy" to promote political candidates. The national party committees also have no limits on expenditures of "soft money."

"Soft money." This has proved to be one of the most profitable and effective ways for political parties and PACs to bypass FECA restrictions. "Soft money," as opposed to "hard money," is raised from sources not restricted by the provisions of FECA. For example, "soft money" may be generated to finance issue advertising for a candidate or to promote voter registration drives by a political party.

Before 1992, "soft money" bypassed both the disclosure and restriction requirements of FECA. In the first year of reporting, Democrats documented \$36.2 million in "soft money," and Republicans documented \$49.7 million in similar funds. By the 2000 election, amounts collected from "soft money" had grown to \$243.1 million for the Democrats and \$224.1 million for the Republicans.

*Public funding.* FECA was created to provide presidential candidates with public funds for campaigning that would curtail the need for contributions from those seeking political favors. Public funding is generated through the tax check-off on individual income tax returns.

Initially, the check-off amount was \$1, but it was subsequently raised to \$3. Presidential candidates may receive public funds only if they choose not to spend their own money for campaigning, and

they are restricted to FECA guidelines if they do accept funding. Public funds are used to match individual contributions of up to \$250, but they cannot be used to match donations from either PACs or political parties.

To qualify for matching funds, a presidential candidate must prove viability by raising over \$5,000 in each of 20 different states. The total amount of matching funds is adjusted for inflation rates for each election. For example, in 1996, \$30.91 million was allotted for matching funds in primary elections. General Election Grants were designed to cover all campaign expenses and no additional campaign funds were allowed.

The adjusted rate for 1996 was \$61.82 million. In order to qualify for General Election Grants, a candidate must have received at least 5 percent of the total primary vote. In addition to campaign and general election funds, each major political party is given funding for political conventions. In 1996, the Democratic and Republican parties each received \$12.36 million to finance their political conventions.

*The Federal Election Commission (FEC).* The FEC was created by Congress to police campaign finance, but legislators gave FEC members little authority or ammunition to carry out their role. To begin with, Congress failed to grant sufficient appropriations for FEC's oversight activities. Additionally, the six-member group, made up of three Democratic and three Republicans, is composed of party supporters who may have little expertise in campaign finance matters. Because decisions may break down on party lines, there is not way to end a stalemate. And because the six members rotate the position of chair in one-year terms, there is a lack of consistency in what the FEC does.

Oversight is further limited because Congress chose not to give the FEC the right to make random audits. Instead, the FEC depends on reports from the candidates to determine compliance. Non-compliance is usually punished by levying fines. In cases of inadvertent violations, the FEC is limited to levying civil penalties of no more than \$5,500 or the amount involved in the violation. If the violation occurred "knowingly" and "willfully," the amount may be doubled to \$11,000 or twice the amount of the contribution. When violations are deemed criminal, the violator may be fined no more than \$25,000 or 300 percent of the contribution and may be imprisoned for up to one year or both. Political

candidates and their election teams have proven adept at finding ways to circumvent the restrictions of FECA. The wealthy, interest groups, big corporations, and labor unions have become particularly skillful at obeying the letter of the FECA law without restricting their contributions.

## SUPREME COURT DECISIONS

The 1st Amendment of the Constitution guarantees the right for Americans to freely express opinions, and supporting a particular candidate for political office is an inherent right of democracy. In 1976, the Supreme Court heard a challenge to the 1974 version of FECA; and while the Supreme Court has been reluctant to uphold restrictions on campaign contributions, it did acknowledge in *Buckley v. Valeo*, 424 U.S. 1 (1976), that corruption, or even the appearance of corruption, may call for some oversight and restrictions on campaign contributions.

The *Buckley* decision determined that FECA restricted free speech and removed Congressional elections from FECA restrictions. It also overturned the limits on total campaign spending and on the amount that individual candidates can spend of their own money on their own political campaigns. *California Medical Association v. FEC*, 453 U.S. 182 (1981), upheld limiting the contributions of PACs to \$5,000. In *FEC v. Massachusetts Citizens for Life*, 479 U.S. 238 (1986), the Court decided that Massachusetts could not ban corporate contributions to independent groups who were involved in supporting specific political candidates because of their stands on issues such as abortion or gun control.

On the other hand, in *Austin v. Michigan State Chamber of Commerce*, 494 U.S. 652 (1990), the court upheld Michigan's ban on corporate expenditures that prevented general treasury funds of the chamber of commerce from being used to fund political candidates. The chamber of commerce placed no restrictions on separate funds being used for these purposes. In 1991, the court overturned the conviction of a state politician who had repaid a political contribution by introducing a bill in the West Virginia legislature, in *McCormick v. United States*, 500 U.S. 257 (1991). In 1995, in *McIntyre v. Ohio Elections Commission*, 514 U.S. 334 (1995), the Supreme Court upheld the distribution of anonymous political advertising, deciding that to demand

disclosure was to engage in overbreadth, which simply means that legislators go so far in making something illegal that they trespass on legal rights. A 2000 decision by the court indicated that they would continue to uphold the provisions of Buckley and to frown on strict restrictions on campaign contributions. *Nixon, et al., v. Shrink Missouri Government PAC*, 528 U.S. 377 (2000), overturned a Missouri law that limited political contributions to no more than \$1,075. The Supreme Court contended that the \$1,000 limit, acceptable under *Buckley* in 1976, may not have been acceptable in 2000 and agreed with the candidate that the low contribution limit placed by Missouri interfered with his ability to effective campaign for political office.

#### POLITICAL ACTION COMMITTEES (PACS)

Early attempts at campaign finance reform neglected to limit campaign contributions to PACs. The number of PACs has grown astronomically in the last three decades. In 1974, there were 608 registered PACs in the United States. Ten years later that number had grown to 4,009. A Political Action Committee is generally created by a corporation, like Coca Cola Bottling Company, or by an industry, such as the beer industry, but it may also be created by individuals who band together. A PAC cannot be created to support a single candidate for office. In 1996, 64 percent of PACs were business oriented, 8 percent were labor-connected, and 28 percent were independent.

Since historically business tends to be more supportive of the Republican Party and labor more supportive of the Democratic Party, it is easy to see that Republicans have been more likely to receive the lion's share of PAC contributions. Subsequent laws on PACS allowed parent organizations to take control of administration and fundraising expenses and to determine decisions on distribution of PAC funds. A PAC can contribute up to five times as much as an individual can give to an individual candidate or a party, and there is no limit on the total amount that can be given to all candidates or to political parties. A number of PACs contribute to both Democratic and Republican candidates. Under current FECA restrictions, PACs may contribute up to \$5,000 per candidate per election.

Incumbents generally have several advantages over their challengers. In campaign finance, this means that incumbents do not have to work as hard

to build campaign funds. That is not to say, of course, that incumbents always need more money. When incumbents occupy what is known as "safe seats," little financial outlay is necessary to win reelection. An incumbent may, however, outspend the challenger by a large margin in tight races.

A challenger often has to expend extra effort to convince donors that her campaign is viable and that campaign contributions will not be wasted. On the average, in the Congressional elections of 1996, 1998, and 2000, winners outspent losers by 2.5 to 3 times. In 95 percent of all House races, the biggest spender won. For example, in 1996, the average winner spent \$650,000 while the average outlay for losers was only \$211,000. The Missouri race between Democrat Richard Gephart and Republican Deborah Wheelahan in that same year further illustrates the vast differences between incumbent and challenger spending.

The campaign outlay for Gephart was \$2,609,500, while his opponent spent only \$48,873. One reason that winners raise more money is that PACs are more likely to contribute to their campaigns. For example, in the 1997-99 election cycle, 78 percent of PAC funds were directed toward winners, and only 10 percent toward challengers. The other 12 percent of PAC funds was given to candidates in open seats where neither candidate was an incumbent.

#### LOBBYISTS AND INTEREST GROUPS

Lobbying is integral to the pluralistic American system. In theory, pluralism dictates that opposing interests check each other by preventing any one individual or group from gaining too much power. In practice, lobbying Congress is a big business because members of Congress are more likely to be influenced by interest groups than by individual voters.

Special interest groups that lobby legislators spend millions of dollars in campaign contributions in each election. Interest groups tend to give to political candidates who are likely to support their views or to the candidate who is most likely to win. After all, only a successful candidate will be in a position to repay contributors with political favors. For example, the National Rifle Association contributes millions to the Republican Party to persuade the president, Congress, and state legislators not to enact gun control legislation. Sometimes

contributors give to both Democratic and Republican candidates to cover their bases and to have some influence with whichever party wins.

As long as campaign finance reform is not a major priority with the voters, Congress has little incentive to enact effective reform. A CBS/*New York Times* poll in April 1997, for instance, revealed that 75 percent of those questioned were convinced that Congress was more responsive to major campaign contributors than to their constituents. Yet, only 22 percent of the respondents even knew that federal law places limits on individual contributions to political candidates. Nor were respondents willing to finance political campaigns with taxes. An overwhelming 78 percent vetoed the idea of totally financing political campaigns with tax-generated funds.

The American media has named itself the watchdog of campaign finance excesses and abuses. Journalists are quick to notice when candidates spend money unnecessarily or when contributions are unusually large or when they come from questionable sources. For example, in the midst of its high-profile scandal, the Enron Corporation contributed millions of dollars to George W. Bush's presidential campaign. Even the most open-minded observer recognized that funds that should have been directed toward retirement funds for Enron employees were being used in an effort to gain political favors.

The move toward major campaign finance reform accelerated in the states in the early 1970s. Once Colorado and Washington had begun the trend with innovative reforms, the other 48 states followed suit. The money spent on state elections, as well as on national elections, has escalated astronomically, and states have passed their own campaign finance laws. Election costs in gubernatorial elections increased 44 percent from the 1977 to 1992. As a result of spiraling costs and a number of campaign finance scandals, most states have mandated increased reporting of contributors and amounts given and have become more restrictive in maximum contribution limits.

In 1980, only nine states placed a ceiling of \$1,000 on campaign limits. By 1996, six more states had followed suit. Out of the 28 states that had no contribution limits in 1980, only 15 states continued this practice into 1996. Californians traditionally spend the most on both state and national elections, and the state often serves as an innovative

model for other states in legislative efforts. If California set the standard for effective campaign finance reform, other states would surely follow. Various states continue to tighten restrictions on campaign financing.

#### PROS AND CONS OF REFORM

Those who oppose any kind of campaign finance reform often argue that restrictions on voters is undemocratic. Many FECA opponents suggest that financial restrictions interfere with free enterprise. Opponents generally accept the pluralist argument that the government has no need to place artificial limits on political actions because opposing groups provide inherent checks. There is also a tendency among those who oppose campaign finance reform to blame the Supreme Court for not clarifying its definition of corruption so that restrictions would not apply to those who do not fall under the specified definition.

Unlike opponents of campaign finance reform, most scholars of campaign finance reform agree that excesses and abuses of campaign finance would be reduced if the need for enormous television expenses were removed. One way to do this would be to allot candidates free airtime on an equal basis. As early as 1969, the Twentieth Century Fund was calling for "voters' time" that would give all major candidates six 30-minute slots in the time immediately preceding an election to "sell" themselves to the voters in simultaneous broadcasts that would be paid for by the federal government at a reduced rate of 50 percent.

A major study by the Association of the Bar of the City of New York's Commission on Campaign Finance Reform suggested that campaign finance reform would be more effective if public funding were extended to include Congressional candidates, if campaign contribution restrictions were more realistic, if controls on "soft money" were enacted, and if the FEC were restructured and given more authority. Critics of the FEC have suggested that even distribution of votes between the Democratic and Republican promotes gridlock, and they call for the addition of an independent member.

They argue that enforcement procedures should be simplified by giving the FEC more authority and expediting court procedures. Reformers contend that the FEC should also be able to conduct random audits rather than depending entirely on re-

porting by the candidates. They also believe that whenever a violation is uncovered, it should be dealt with immediately. For example, the public interest was not served when former President George H.W. Bush reportedly received notification of a campaign finance violation months after he had lost the election to Bill Clinton in 1992. Major reform of the FEC seems unlikely, however, because in 2003, the Democrats removed Scott Thomas, the active Democratic chair of the FEC, because he was attempting to stifle campaign finance abuses.

Most suggested campaign finance reform is designed to limit the loopholes that led to the proliferation of "soft money" over the past three decades. There is also a move toward government regulation of "issue advertising" that promotes a particular candidate while attacking his opponent in less than truthful terms. Placing legislative restrictions on "soft money" has been complicated by the Supreme Court's position on campaign contributions as free speech because it is difficult to identify the exact point where free speech ends and legitimate restrictions begin.

In 1997, in a joint resolution (S.J. Res 18), members of the Senate attempted to amend the Constitution to mandate Congressional and state authority to establish contribution limits. The resolution failed 38 to 61. Democrats split 34 for and 14 against the constitutional amendment, while only four Republicans voted for it. A number of bills aimed at tightening earlier versions of FECA were remanded to the House Committee on House Administration in 2003. Bills in the House of Representatives included H.R. 156, which would require those who conduct telephone surveys on federal campaigns to identify the individual or group who sponsored the poll to the respondent and to disclose the total cost of the poll and the funding sources for the poll to the FEC.

It would also mandate that the conductors of the poll furnish a copy of the survey to FEC, along with a report on the total number of households surveyed. H.R. 681 would extend the Bipartisan Campaign Finance Reform Act of 2002 (also known as the McCain-Feingold Act) to prevent committees that received personal loans from a federal candidate from repaying the loan while the candidate is in office. H.R. 797 would amend the 1971 version of FECA to ensure that no campaign funds could be used to pay salaries of candidates or their family members. H.R. 1878 would amend FECA to

provide public funding for elections for members of the House of Representatives. H.R. 2529 would amend FECA to limit out-of-state political contributions to no more than 25 percent of total contributions. This proposed action is in response to practices that allow national political parties or groups to channel funds into a state to support a candidate who is in danger of losing a close race, or to defeat a candidate who is considered damaging to their views on certain issues. H.R. 2529 would also institute expanded disclosure requirements. H.R. 2709 would replace the Federal Election Commission with the Federal Election Administration and make major revisions in the operation of the new group. A similar Senate bill, S. 1388, was referred to the Senate Committee on Rules and Administration.

## Canada

ALTHOUGH VIOLENT crime pervades the mass media and dominates public perception about the crime problem in Canada, white-collar and corporate crimes actually do more harm, cost more money, and ruin more lives. The Canadian economic history is, in fact, filled with white-collar and corporate crimes and illegalities.

Federal statistics show an annual increase of seven percent in the incidence of white-collar and corporate crimes. A Statistics Canada report in the early 1980s found the number of workplace deaths attributed to unsafe or illegal working conditions to be equivalent to the number of street homicides. This does not include "lingering deaths" resulting from exposure to "hazardous workplace pollutants." According to some studies, Canadians pay increased taxes and prices for consumer goods amounting to as much as \$20 billion a year as a result of white-collar crime.

Many types of white-collar crime can be found in the Canadian Criminal Code. Provincially created white-collar offense codes, though not criminal law in the strict sense, are also enforced through the traditional criminal justice system. Police and prosecutors at the federal, provincial, and municipal levels bear the primary responsibility for taking action against most individual white-collar criminals.

The difficulty of the enforcement effort to control white-collar crime by the criminal justice system is notable, partly because the enforcement

agencies in Canada receive relatively few complaints from victims of such crimes.

## PROSECUTION AND REGULATION

The criminal justice system, in general, lacks sufficient resources to detect and prosecute white-collar crimes. Moreover, the defendants in white-collar cases tend to put up a much stronger legal defense, since they usually have far more financial resources to hire experienced attorneys. An alternative means of regulating white-collar crime in Canada is for the state to impose certain duties of care on people, and to allow the plaintiff to seek damages from the defendant for the wrongdoing. In general, white-collar and corporate crimes seem to be easily condoned by the criminal justice system and the general public, compared to street crimes.

Corporate crimes are usually dealt with outside the criminal law and regulated by separate federal, provincial and municipal laws. Enforcement is handled by special government departments and bodies through a regulatory system focused on mediation and compensation rather than on prosecution and punishment. For example, the Canadian provinces have introduced workers' compensation acts and regulations governing occupational health and safety that create systems of workplace safety standards and inspection.

The best-known example of legislative efforts against corporate crime is the federal Competition Act (formerly the Combines Investigation Act), which prohibits various forms of potentially anti-competitive acts. These include unfair margin squeezing, freight equalization to impede competition, misleading advertising, the use of fighting brands to eliminate a competitor, conspiracies to fix prices, and other corporate crimes. Responsibility for the enforcement of the Competition Act is divided among several authorities: Parliament which passes the legislation; the Director of Investigation and Research (DIR) under the Competition Act who heads the Competition Bureau and investigates possible violations; the Department of Justice (DOJ) which takes cases before the courts or Tribunal; and the adjudicators who determine if a violation has occurred and, if so, what penalty or remedy is appropriate.

The average fine per firm increased over seven times in real terms between the five-year periods 1986–90 and 1991–95. The largest fine per firm rose

*The city of Vancouver, on Canada's Pacific coast, is a modern metropolis that exemplifies Canada's business growth. Along with economic growth, however, Canada has seen huge increases in white-collar and corporate crime.*

from \$1 million in 1990 to \$2.5 million in 1995. These larger fines, however, do not necessarily mean that all the economic gain from the conspiracy was eliminated.

Even taking into account all the costs they incurred, the convicted firms may well have profited from violating the conspiracy provisions. This raises the question whether these enforcement actions achieve specific and general deterrence as they are supposed to do. Furthermore, the Competition Bureau's budget has declined in real terms in recent years. The record indicates that the average number of criminal prosecutions (excluding misleading advertising cases) rose from an average of five per year in the period 1966–70 to 16 in the period 1981–85 and then fell to an average of 5.8 per year in the period 1991–95. The biggest drop in the number of prosecutions has occurred in price maintenance and misleading advertising cases. The speeches of bureau officials indicate that, due to budget cuts, cases that in the past would have resulted in a recommendation to prosecute are not being pursued.

#### STATUTE EXAMPLES

Another illustrative example is the provincial securities statutes, which prohibit market participants from engaging in unfair practices, such as stock manipulation and insider trading. The central role of

these statutes is to protect investors in the financial markets by making sure that publicly traded companies play by the rules. There are 13 provincial and territorial securities commissions responsible for enforcing the securities statute in each province. But the regulatory agencies' power lies more in persuasion than in punishment.

The commissions can force companies to comply with securities rules, fine them when they don't, and even charge them in civil court (or criminal courts in Ontario and Alberta) with violating the law. Canadian officials have the tools to go after offenders, including broad powers to subpoena documents and witnesses. But they have demonstrated little success in prosecuting securities offenses.

Other examples of white-collar and corporate crime laws include the Canadian Environmental Protection Act (protecting the environment, human life and health from the risks associated with toxic substances); the Food and Drug Act (prohibiting harmful or dangerous cosmetics, device, foods and drugs); the Hazardous Products Act (regulating such products as flammable bedding and consumer chemical products); the Explosives Act (prohibiting various kinds of explosives); and the recently enacted Corruption of Foreign Officials Act (creating offenses relating to the bribing of foreign public officials). Similarly, these laws are not always fully enforced and impose penalties that fail to deter illegal

actions. Many corporations may view the penalties for corporate crime as a mere cost of doing business in Canada.

The ties between the corporate sector and the state have traditionally been even stronger than in some other industrial countries, and the law-reform efforts for stronger legislation, enforcement, and penalties for white-collar and corporate crime have been far more difficult.

## Canadian mining scandals

THE MINING INDUSTRY in Canada has long been associated with shady business practices and dodgy stock-market deals. Gold mining in particular has always produced a frenzy of speculation. The promise of the "big find" has attracted a disproportionate number of unscrupulous individuals and companies with a get-rich-quick mentality.

Historically, it was individual prospectors who searched for precious metals such as gold. After the growth of mining investment companies in the post-World War II period, however, individuals invested in an exploration and mining company which financed operations by selling shares on the stock market.

Spectacular financial gains are often produced by speculation on the potential value of the mineral deposit before any metal is actually found. Mining companies thus have a great incentive to exaggerate,

misrepresent, or lie about the quantity and value of the metal discovered in order to attract potential investors.

By the 1990s, Canada had become the mine finance capital of the world. Per capita, Canada also had the largest number of stock market scandals in the world, many of which involved the mining industry. It was with the Bre-X scandal of the 1990s, however, that the extent of the problem was truly revealed. Bre-X was founded in 1989 as a tiny mining exploration company.

In 1993, it purchased rights to a potential gold deposit in the Busang area of Indonesia for \$80,000. Subsequently buoyed by the false reports of company geologists, John Felderhof and Michael de Gusman, that the area contained the largest gold deposit ever discovered, the company successfully raised tens of millions in investment dollars from eager investors.

Despite the lack of independent tests to confirm the size of the deposit, Bre-X managed to fool other reputable mining companies, the *Northern Miner*, the most respected trade paper in the industry, prominent investment banks, stock market analysts, and even security regulators for Canadian stock exchanges. As Douglas Goold and Andrew Willis write: "A sky's-the-limit tone would come to flavor any reports on the company right through to the stock's spectacular crash." By 1996, Bre-X stock has risen to a value of \$6 billion and was traded on the prestigious Toronto and NASDAQ stock exchanges.

In mid-1997, the speculative bubble burst. Guzman apparently committed suicide in strange circumstances, leading to a series of independent audits of Bre-X's claims. Soon after, it was confirmed that test samples had been tampered with and that Busang actually contained little gold. Bre-X's stock values dropped to pennies a share. Thousands of investors, many of them modest individuals who used the increasingly popular method of buying stocks from the internet, lost their life savings while numerous high-level company officials, such as company president David Walsh, made tens of millions.

Subsequent investigations of the Bre-X scandal have highlighted the sheer greed of mining industry officials and stock market traders; the lax regulation of stock exchanges; the weakness of national and regional laws against individuals and companies engaged in such fraudulent schemes; and the almost

total lack of protection for consumers who chose to invest in the industry.

## capitalism

THE BASIC TENET of capitalism is that the accumulation of wealth for its own sake is a worthwhile economic goal for all individuals. Supporters of capitalism claim that it is a politically neutral system that is only self-managed by the nature of supply and demand.

The model of the economic market under capitalism argues that society will make the most efficient use of our resources and talents if each individual works as hard as she possibly can to meet the demands of all other individuals who decide on their own what they want and need. Thus, the market assumes that we are all each individually motivated by greed. And, as each person continues to strive to meet the needs of others, she will also be motivated to meet her own wants and needs, and thus compete with other capitalists for more profit from meeting the needs or demands of society at large.

This competition allegedly rewards those who meet the demands of others at the lowest price. Proponents of capitalism argue that this motivation to produce in order to meet the needs of others and, thus, make money and meets one's own individual

needs is said to be efficient. This efficiency promotes the acquisition of goods and money. Critics of capitalism point out this model results in unequal outcomes; promoters of the model claim that unequal outcomes are natural or normal. Supporters of this economic system argue that the supply and demand for goods, cut-throat competition, and high levels of income inequality are considered efficient. Capitalism among Western societies, particularly in the United States, flourished through legislation permitting its unfettered growth and support via numerous government subsidies.

### HISTORY OF CAPITALISM

England was the first country in the world to transition from feudalism to capitalism from the 16th to 17th centuries. Capitalism developed out of existing feudal relations because it became profitable for a whole new set of people to contend with the former power and wealth of the old lords of the manor. Richard Lachman argues that the ideological value of private property among the new wealthy grew as peasants in France and England began to organize against the exploitation of the feudal landlords.

These organized peasants won personal freedoms in addition to the right to own land. Subsequently, the new wealthy classes began using the political system to protect and expand their surplus of wealth and land at the expense of the poor. As private property ownership flourished among the former nobility classes, classes of landless laborers remained to be exploited in the developing capitalist economic system. Additionally, a struggle ensued between the monarchy and the new wealthy for power, land, and money.

The first capitalists in England were commercial farmers and ranchers as well as merchants. Thus, national political systems grew from the class struggles between the poor, the political elite, and the new rich. Evidence of this can be seen in the state efforts to make war in order to gain taxable land and thus increase power and income. Furthermore, wars made explicit the need for war materials, which then bolstered the early development of capitalism. Meanwhile, national taxes further impoverished peasants forcing them to sell their land to commercial development projects, increasing the wealth of the bourgeois class and making independent peasants into proletariats or dependent workers. The

use of taxes in France (and in the American colonies) to increase the wealth and power of the state fueled the development of the French and American Revolutions in the late 18th century.

Early colonial America began to seek independence from Britain not because they felt oppressed by a loss of civil or social rights, but because merchants and traders became weary of the economic controls imposed on their profits. Great Britain had imposed a number of merchant restrictions and this was resented in both the northern and the southern colonies. By the 17th century, Boston, Massachusetts, became one of the wealthier cities as the mercantile group gained additional profits from shipping and trade, and conflict grew between the colonies as they competed for trade profits. By the 18th century, Britain continued to tighten its hold on the colonial economy through trade restrictions, the imposition of tariffs on imported goods, and the prohibition of western movement across the land.

These developments also fueled the move toward independence. It was men of property, planters, and merchants who wanted independence and a strong central government to protect their economic and property rights. Thus, the Constitution made property rights the central institution of the new country, resulting in federal government control of commerce between the states, taxes, and trade with other nations. The new American mercantile-based political economy simply replaced the British merchant government. This merchant-style economy, tied to the federal government, fueled America's capitalist development. The Constitution supported the maintenance and reproduction of a financial elite with more money and political influence than most Americans.

#### AMERICAN WHITE-COLLAR CRIMINALS

Before the Revolutionary War however, the first group of richest men in America became rich by providing weapons and other military supplies to the British military in the war against the French during the mid-18th century. The French and Indian War, from 1754 to 1763, made even more men rich on both sides. Both before and during the Revolutionary War, a number of merchants became America's first group of millionaires from the privateering of a variety of other nations' navy and civilian vessels. Once the American Revolution

began, these thefts made those same Americans even richer. Thus, the first white-collar criminals in America were also the first wealthy Americans.

Moreover, early government representatives also committed white-collar crimes. Specifically, the head of the Congress' procurement committee, later superintendent of finance, awarded one-quarter of all government contracts to his own company and stole the rest of his wealth from privateering. More than 3,000 British ships were captured during the American Revolution with cargoes valued at about \$18 million. One of New Hampshire's most successful white-collar criminals, John Langdon, later became the state's governor and a U.S. Senator. John Brown, of Providence, Rhode Island, became a privateer and slave owner, and later his money gave Brown University its name in 1804. By the end of the 18th century, most of America's millionaires were in Massachusetts and most had made their fortunes from privateering, this included the Derbys, Peabodys, Thorndikes, and Cabots. Even John Hancock, was a merchant, smuggler, and privateer.

Government contracts made more people wealthy than privateering during the war and gave rise to the textile industry. Some of the budding capitalists of America were made rich by the federal government contracts.

In 1789, Alexander Hamilton's economic plan included a national banking system and the sale of all the federal government's debt instruments at low prices, making many former privateers wealthier. The federal treasury gave away from \$40 to \$60 million. These government representatives, who valued the financing of the capitalists, became the nations' new economic and political elite. This is contrary to the notion that the market is supposed to operate free of government interference.

In 1791, the first spinning mill operated by waterpower was set up in Pawtucket, Rhode Island. Capitalism had begun and, at first, children were employed, followed by hiring families to weave the yarn in their own homes. By 1795, in cities such as New York and Philadelphia, the proportion of wealth controlled by the top 10 percent of the population grew to 61 percent. Clearly, economic inequality existed since the beginning of capitalist development in the United States.

In 1810, Stephen Girard bought the former United States Bank and then loaned money to the U.S. government during the War of 1812. Girard owned most of the stock in the bank and, between

the money gained on interest from loans to the federal government and ownership of real estate in Pennsylvania, including the oppressive coalfields, he became the richest man in the country by 1831 with \$6.5 million. Coal was important in the new iron industry as it was burned to make iron.

Later, John Jacob Astor became the richest man in the country, primarily from his fur-trading company that also committed white-collar crimes. Specifically, he stole most of his furs from the Indians, or trade them for practically worthless goods. Meanwhile, in the American South most of the richest men were rich from cotton grown and picked by slave labor. In 1826, in other capitalistic developments, the first assembly line was used in the meat-packing industry, where the worker had a fixed location and the product came by the worker on a moving belt. Here, the live animal entered the plant, was slaughtered and each worker performed a specific task on the carcass.

### AMERICA'S FIRST FACTORIES

By the late 19th century, a new wealth had been created, assisted by a government-backed banking and insurance system. In 1886, Francis Cabot Lowell set up the first U.S. factory combing spinning and weaving in the same place. Here, New England farmers' daughters were working in order to earn funds for their fathers or future husbands. These women were America's first sweatshop employees. They worked 72 hours a week, were required to attend church, lived in dormitories at the plant (for which they were charged), and were chaperoned to ensure their moral behavior.

The first blacklists began here as well, when women who protested against work speed-ups or pay cuts were prevented from getting jobs elsewhere through employer discrimination. The women eventually began their own workers' movement aimed at a 10-hour day and, as a result, most were fired and replaced by new Irish immigrants who were willing to work for lower wages because they had no alternative. The Irish were the first permanent labor force in the nation.

This was the beginning of the exploitation of the American working class and the birth of American capitalism that was subsidized by the federal government, leading to the development of a small group of economically wealthy families. Other semi-manufacturing processes grew in the 19th cen-

tury; these included food-processing and flourmills as well as the meat-packing industry.

"By 1860, two-thirds of the Deep South slave-owner's wealth was in slaves and located in the five major cotton states of Alabama, Georgia, Louisiana, Mississippi, and South Carolina. Slaves accounted for about 60 percent of all agricultural wealth," historian Kevin Phillips explains. Half of the South's income belonged to about a thousand families. The federal government refused to compensate the South for their slaves, as plantations owners in the West Indies had been by the British. The U.S. government did not have the funds to accomplish that goal even if it wanted to; thus, the South waged war to keep its slaves and capital.

### CITIES AND MANUFACTURING

Meanwhile, farther North, New York, Philadelphia, Boston, Baltimore, Cincinnati, and St. Louis were fast becoming centers of wealth from water commerce. They also contained America's greatest levels of economic inequality, or the largest gap between the richest and poorest. By 1845, in some of these cities, the top 1 percent controlled from 37 to 40 percent of the wealth. Only in rural areas of the country was republicanism or economic equality still alive. In New York City, by the middle of the 19th century, there were more millionaires than any other urban area in the country (mostly due to owning prime real estate, including houses of prostitution), and this represented one-quarter to one-third of the country's total wealth.

Working-class men began to unite and collectively protest their oppressive treatment and poor wages, although they had little impact as urban poverty continued growing. But by the late 1850s, only about a half-dozen states and 4 percent of the population were employed in manufacturing. New immigrants and freed African-Americans took the jobs of second- and third-generation European Americans, pitting the working class against itself, based upon ethnic or racial lines.

Prior to the Civil War (1861–64), most manufactured items were imported and the major form of profit-making was land acquisition and trading. The smelting of iron during the Civil War increased because of the demand for bullets and canons and the need for railway transportation. The third industry to develop in the country was the gun industry. Eli Whitney and Simeon North redesigned the

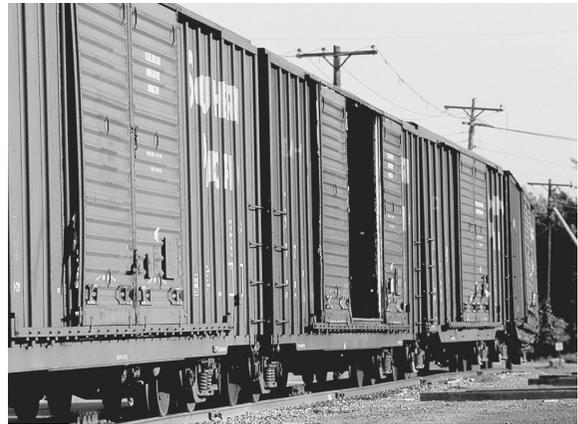

*Faneuil Hall in Boston was the site of America's first enterprise: the market. White-collar crime soon followed.*

early process in which a craftsman made each unique gun from start to finish. Now, the parts were made first to a standard pattern and were finally fitted together to make a single weapon. This, of course, was the result of a government contract. In 1813, the process was used to make single-shot pistols and, later Samuel Colt used it to produce the multiple-shot or the six-shooter revolver.

#### FURTHER FUELS OF CAPITALISM

The fuel for the development of early capitalism was characterized by primarily by slavery, imperialism, and colonialism, as Western Europe and the United States exploited the natural resources, humans, and animals in foreign lands in the pursuit of profit and private property. Similar to the manner in which capitalism grew from wars in Europe, in the United States, capitalism's major impetus came

*Railroads were encouraged to expand with land grants provide by the U.S. government.*

in the 1860s as the result of the American Civil War. During the Civil War, the federal government began selling bonds to finance the war. The national debt had increased from \$65 million dollars in 1860 to \$2.6 billion in 1865. Such debts are usually paid for by the losers, while the war winners inevitably become richer. In this case, after the war the North became richer while the South grew poorer.

Prices of wartime supplies rose, benefiting industrialists, while workers' wages lagged behind. Stock market prices fluctuated with the losses and wins of battles but ultimately, as the North began to win the overall war, the stock market prices rose and brokers became rich. The war brought wealth to a number of people, who by the end of the 19th century, included industrialists and merchants J. P.

*Mining, whether above or below ground, was a fuel of capitalistic growth, and led to new corporate crimes.*

*The progress of capitalism in America, and throughout the world, has been relentlessly exploiting new industries for industrial growth. Even in modern electronics factories, worker exploitation continues as well.*

Morgan, John D. Rockefeller, Andrew Carnegie, Jay Gould, Marshall Field, and Philip Armour. The war turned \$10–\$20 million millionaires into millionaires worth \$200 to \$300 million by the 1880s. In 1870, following the loss of the Civil War, the South owned only 12 percent of the nation’s wealth, down from 30 percent in 1860. Moreover, a whole new group of Northern industrialists became rich from the production of army weapons, uniforms, and equipment while Southern plantation owners lost slaves, two-fifths of their livestock, and one-half of their farm machinery. Additionally, Northern carpetbagger government officials imposed stiff taxes that further crushed the Southern economy. The South paid for the ensuing economic transformation of the economy, as paper currency was created and income-tax developed, and a new national banking system was begun. Southerners paid \$1.2 million in taxes for the benefit of to the rest of the country after 1865.

### RAILROAD EXPANSION

The federal government provided a great deal of financial support to the railroad companies to build their rail lines and usurp the land of small farmers and ranchers. Related to that expansion was the 1886 Supreme Court case in which the court ruled in *Santa Clara County v. Southern Pacific Railroad* that a corporation is a person and thus has all the same rights and privileges as any other citizen. Thus, as a person it is permissible for the government to finance a company’s growth.

Land grants were the major method by which the government supported the growing railroad industry. A land grant provided land for free or at a minimal price to encourage railroad expansion. The railroaders used the wage-ticket system to hire Chinese men without families (so the men would work more hours) to increase profits and build the railways at minimal costs. By 1871, the railway companies had gained about 129 million acres of land and what they didn’t use, they sold. They made over \$136 million on land sales while they only paid about \$70 million to construct the railways. In 1834, a group of farmers were the first to refer to capitalists as “robber barons” as the term was originally aimed at the railroad industry.

### REGULATING CAPITALISM

The Sherman Antitrust Act was passed in 1890 allegedly to prevent the development of monopolistic industries that could increase prices on products *ad infinitum*. However, the law actually prohibited anyone or anything from conspiring to restrain trade, including trade unions. Government subsidies to the railroad companies continued through 1890 and included loans of up to \$95 million.

The market and the polity became the best of friends with the profits made by capitalists used to sustain political candidates’ campaigns, as well as to produce and maintain the revolving door of corporate executive turned politician, and then back again. An increase in elite capitalist power in the late 18th and early 19th century came when police

forces were organized to protect the wealth of the new industrialists, and to control the poor and working classes through the criminal law.

At the time, the working classes began interfering with capitalist's profits through union protests and work stoppages. Businesses claimed that protesters were violating corporations' due process rights. Similarly, the Federal Bureau of Investigation (FBI) was initially developed in 1908 as an agent of big business. For example, the initial enforcement of the Sherman Antitrust Act was against a labor union charged with restraint of trade.

America became one of the richest nations in the world: By 1900, there were about 4,500 millionaires in the United States compared to only about 10 or so in 1800. Into the 1900s, Americans left farms and became factory employees working 60 to 80 hours per week in unsafe conditions.

## WORKERS' RIGHTS

While relatively few families became rich, conditions for the factory workers in America continued to deteriorate from the late 18th century through the early 20th century with some workers being chained to the floor, and employing children forced to work 12 to 16 hours a day in dangerous conditions. By the early 1900s, the socialist press began calling attention to the horrible conditions in factories and the corrupt political machines that allowed them to exist.

In 1901, the American Socialist Party was formed and began to advocate for workers' education to teach workers how to organize and improve their working conditions. Three types of labor education programs grew in the United States; these included independent labor schools, educational programs associated with unions, and labor studies programs in colleges and universities. By the 1920s, 10,000 workers were participating in worker education programs in over 300 programs across the country. The schools taught employees how to organize strikes and, as a result, workers began collectively organizing.

Subsequently, a strong collective labor movement demanded and won the right to a 40-hour work week, safe working conditions, better pay and benefits, and the prohibition of child labor in the United States. However, by 1954, union membership had leveled off at 39 percent of workers and, by 1999, it had dropped to 10 percent. From 1969

to 1979, strikes involved almost 950,000 workers annually, but from 1987 to 1996, most strikes involved less than a half-million people. Corporations began to break strikes, union members lost wages rather than won increases, and the Democratic Party became less supportive of workers' rights and, like their Republic brethren, became more supportive of corporate America.

Furthermore, a series of court and administrative decisions narrowed the rights of workers while broadening the power of employers. U.S. labor law even allowed corporations to oppose workers' efforts to unionize. For example, while workers are guaranteed the right to strike and they cannot be fired for striking, employers are guaranteed the right to continue to produce goods and thus can hire permanent replacement workers.

However, even though workers' are not as inclined today to organize to protect themselves from industrial exploitation, and corporations wield more workplace power than ever, it appears that district attorneys are moving in a new direction to criminally prosecute corporations responsible for the deaths of workers in dangerous work settings. Prosecutors in 14 states have sent at least 12 corporate managers to jail in the 1990s for the murder of plant or factory workers due to unsafe conditions.

## WORKPLACE DEATH

One of the most infamous cases of workplace exploitation resulted in the death of Stephen Golab at the Film Recovery Plant outside Chicago, Illinois, in 1983. The county medical examiner ruled Golab's death a homicide that was caused by an inadequate safety protection system, which exposed him and other workers to cyanide gas produced in the processing of film at the plant. Moreover, plant managers actually removed the warning labels from the cyanide gas containers at the plant. In 1985, five company executives were indicted for murder and after eight years of court battles, three managers were sentenced to three years in prison for manslaughter. This was the first time that criminal law had been used to convict executives for maintaining dangerous conditions at a workplace.

Since the late 1970s, a growing number of manslaughter and murder charges have been brought against corporations for worker deaths. Traditionally, worker deaths in factories and plants have been handled through the civil court system

where workers and families have received financial compensation in wrongful death suits.

By the 21st century, capitalism made the United States one of the wealthiest countries in the world with the greatest degree of economic inequality. Economic globalization has increased the unregulated strength of American and transnational corporations as well as their wealth.

However, perhaps criminal law may eventually catch up and begin making corporate capitalists accountable for their role in the death of workers, environmental pollution, theft, and financial crimes that have characterized capitalism since the nation's birth.

## Capone, Alphonse (1899–1947)

AL CAPONE IS PERHAPS the most well-known and important figure in the history of organized crime. Also known as Big Al and Scarface, little is known about his youth, other than he grew up in a rough neighborhood and was a member of two youth gangs, the Brooklyn Rippers and the Forty Thieves Juniors. He became part of the notorious

Five Points gang in Manhattan, New York City, and worked in gangster Frankie Yale's Brooklyn speakeasy, the Harvard Inn, as a bouncer and bartender. While working at the inn, Capone received his infamous facial scars and the resulting nickname Scarface when he insulted a patron and was attacked by her brother.

Although Capone ordered dozens of murders and even killed with his own hands, he often treated people fairly and generously. He was equally known for his violent temper and for his strong sense of loyalty and honor. He was the first to open soup kitchens after the 1929 stock market crash and he ordered merchants to give clothes, coal, and food to the needy at his expense. These actions gave his reputation a temporary boost, until the St. Valentine's Day Massacre, Capone's most notorious crime committed February 14, 1929, in which six gangsters and a medical doctor were shot to death.

The news media distributed the death-scene photographs across the nation and the event came to epitomize the lawlessness of the Prohibition era. The massacre occurred at the headquarters of bootlegger "Bugs" Moran's North Side gang, a Capone rival. Because two of Capone's men were dressed as police, the seven victims thought it was a police raid and accordingly, they dropped their guns, putting their hands against the wall.

Using two shotguns and two machine guns, Capone's men fired more than 150 bullets into the victims. In 1930, at the peak of his power, Capone topped Chicago's new list of the 28 worst criminals and became the city's famous Public Enemy Number One.

The popular belief in the 1920s and 1930s was that illegal gambling earnings were not taxable income. However, the 1927 Sullivan ruling claimed that illegal profits were, in fact, taxable. Capone never filed an income-tax return, owned nothing in his own name, and never made a declaration of assets or income. He did all his business through front men so that he was anonymous when it came to income. Financial investigations disclosed a cash-receipts ledger that not only showed the operation's net profits for a gambling house, but also contained Capone's name; it was a record of Capone's income.

Later, Capone's tax lawyer Lawrence Mattingly admitted in a letter to the government that Capone had an income. The ledger, Mattingly's letter, and the coercion of witnesses were the main evidence

used to convict Capone. In October 1931, he was convicted of income-tax evasion and was sentenced to 11 years in prison. While in Alcatraz prison, it was discovered that Capone was suffering from an advanced case of syphilis. He spent the last six years of his life as a recluse in his Florida home. In 1947, Capone died from the aftermath and complications of a stroke.

In the annals of white-collar crime, it has been said that Capone stole as much from the poor as he did from the rich—possibly more through his control of the unions and extortion of small businesses. Indeed, his victims were the working class, and the wealth he displayed came largely out of the pockets of those working people who were tempted into his gambling dens and brothels.

## Caribbean islands

IN MAY 2002, Stanley Works Inc., a Connecticut-based tool-making company, reincorporated in Bermuda, joining the recent list of U.S. firms (Fruit of the Loom, Ingersoll-Rand, and Tyco) "relocating" to escape taxes. The issue was prominently featured in the news and sparked a supposed outcry from politicians who claimed such moves were unpatriotic. Importantly, the issues of tax avoidance, tax evasion, as well as the concerns regarding offshore havens, date back generations. The Caribbean has been the focus in much of this history.

In 1937, President Franklin D. Roosevelt received a report on tax evasion from Treasury Secretary Henry Morgenthau, Jr. Roosevelt forwarded the document to Congress with this message: "Efforts at avoidance and evasion of tax liability [are]

so widespread and so amazing both in their boldness and their ingenuity that further action without delay seems imperative." In response, the 75th Congress created the Joint Committee on Tax Evasion and Avoidance. Morgenthau's report to Roosevelt listed the major and unprecedented devices used to beat the income tax.

Number one was the creation of "foreign personal holding corporations in the Bahamas, Panama, Newfoundland, and other places where taxes are low and corporation laws lax." Morgenthau pointed out the difficulty of gathering information on Bahamian companies (owned by Americans) that are "organized through foreign lawyers, with dummy incorporators and dummy directors, so that the names of the real parties in interest do not appear." In testimony before the Congressional Joint Committee, Morgenthau castigated the many "ingenious lawyers and accountants" who were very well paid to construct immoral methods for their clients to avoid taxes.

In 1961, the Internal Revenue Service's Audit Division prepared a pamphlet for internal use prompted by many signs that schemes for the evasion of taxes were multiplying. These depended largely on the use of controlled foreign corporations, partnerships, or trusts. It was becoming clear that money was being funneled at an increasing pace to offshore countries and newly formed companies in order to avoid domestic taxes. The pamphlet's first example dealt with currency moving through Panama and the Netherlands Antilles. Another illustration featured the Bahamas. In this case, the culprit was quaintly described as "Mr. X, the cunning taxpayer." The Internal Revenue Service (IRS) calculated he owed about \$10 million in taxes and penalties. Interest in this was so new, however, that the IRS felt the need to provide 15 "clues" for agents to alert them to these plots. "Keep watch," agents were informed, for signs such as a license to operate in a foreign country; a domestic corporation borrowing from a foreign corporation; the liquidation of foreign corporations; and the transfer of assets to a foreign corporation.

Thirty years after the first Congressional hearing on tax evasion through the use of off-shore companies, an attorney told IRS Special Agents attempting to untangle his enterprise:

There is nothing more corrupting to our society than a system of taxation. I have no words

strong enough to condemn the society in which we are living in terms of taxation. He (the taxpayer) puts money in a Bahama central trust. Why in the Bahamas? There is no income tax or estate tax in the Bahamas. Why in a trust? A trust is like a corporation, a separate legal entity. This separate entity is a non-resident alien, and a non-resident alien can sell an asset in the United States with no tax. How delightful! Now, if that non-resident alien ties in with a distributing company in the Netherlands Antilles, which can earn interest in the United States without a tax under any circumstances, he has put together a perfect set-up. He takes losses and deductions in the United States and he takes gains and profits abroad, under a tax treaty. Do you think any Congress we have is going to change the laws that allow this? Let's not kid ourselves. With those savings, the rich of this country can afford to buy the entire Senate, if necessary.

Ten years later, the U.S. Senate's Permanent Subcommittee on Investigations (PSI) concluded "that the use of so-called 'secret' offshore facilities has become so pervasive that it challenges basic assumptions regarding the ability of federal and state authorities to enforce the laws." Furthermore, according to the PSI, some Caribbean nations were so corrupted that they essentially offered themselves as crime havens.

Almost all tax havens are characterized by strict rules of bank secrecy and little (if any) taxes. The strict secrecy associated with banks also applies to the activities and ownership of corporations. In addition, there are often no income, profit, capital gains, gift, inheritance, estate or withholding taxes in offshore havens. Although such nations tax imports and some real estate property, this has little effect on those who own or use its many banks or corporations. Thus, for a small initial cost and annual fee, one may own a bank or company that can receive and disburse large sums of money in complete secrecy and without the threat of taxation. These advantages, of course, are available to bank depositors as well.

Even though offshore tax havens may provide legitimate investment opportunities for American citizens wishing to avoid taxes, a practice recognized as lawful by U.S. courts, it is the evasion of taxes by using tax-haven countries that now concerns law enforcement authorities. Douglas J. Workman has

stated, "Tax evasion involves acts intended to misrepresent or to conceal facts in an effort to escape lawful tax liability." Tax havens may be used to hide income or to misrepresent the nature of transactions in order to put the taxpayer in a more favorable position. For tax evaders, offshore havens guarantee that paper trails will be blocked. Though the proximity of places like the Bahamas to the United States was once a key factor in drawing tax evaders and others seeking to hide assets (for example, drug traffickers and money launderers), the pervasive trend toward electronic transfers and other technological advances has diminished geography as the crucial lure.

Offshore havens, including those in the Caribbean, have benefited from the explosion in technologies. This has caused a great deal of grief among U.S. regulators since "banks" may not have vaults or tellers, and do not transact business in the local currency. Offshore banks transfer funds electronically, often using correspondent banks in the United States. Consider the following: The IRS is attempting to investigate MasterCard and American Express card transactions in the United States that were billed to bank accounts in Antigua and Barbuda, the Bahamas, and the Cayman Islands. While Americans can legally move their assets offshore, they are required to notify the IRS of those transactions and to pay taxes on their income worldwide. As one commentator, David Clay Johnston, succinctly stated:

Some Caribbean countries offer an alluring tax haven, however, because they impose no income tax and do not generally cooperate with IRS efforts to track down incomes. But Americans who shelter income offshore face the problem of putting their money to use. That is where a credit card or charge card billed to an account at a Caribbean bank comes in handy, investigators say. Banks in tax refuges issue MasterCards and Visa cards, which can be used anywhere to draw cash and to pay expenses. The bill is then paid automatically from the bank in the tax-haven country, leaving no record of income or spending except for the transaction reports from the networks that MasterCard, Visa and American Express operate. [To facilitate these large credit card transaction, the IRS says some of these banks offer credit cards with \$1 million monthly charge limits.]

The complicated matter of distinguishing between the legal practice of tax avoidance and illegal tax evasion continues to play out in the public and private arenas. For example, American companies have increasingly opted to incorporate in offshore havens, like those in the Caribbean, to sharply lower their tax burden without compromising the benefits of doing business in the United States. Ingersoll-Rand “moved” to Bermuda and its tax burden went from approximately \$40 million to \$27,653 (technically an annual fee rather than a tax). The “move,” however, is nothing of the sort. Rather, it is simply a paper transaction, and does not require anything beyond establishing a mailing address in the haven. Therefore, Ingersoll-Rand will not even establish an office in Bermuda, according to the company’s chief financial officer. He also stated that the firm simply pays a service organization there to accept mail. Significantly, since “companies that move to Bermuda usually keep their main offices in the United States, they continue to have all the security provided by the American government, the legal system and the courts,” Johnston explains.

## Carl Karcher Enterprises

REPORTS OF CONNECTIONS between the Ku Klux Klan and the fast food holding company, best known for hamburger chain Carl’s Jr., are almost certainly urban legends. The misdeeds of Carl Karcher Enterprises (CKE) are not racial but financial, including an insider trading scandal, misvaluation of Arizona acquisitions, and squabbles with co-branding partners.

CKE is named for founder Carl Karcher, who parlayed a hotdog cart into a 2,000-restaurant business with almost \$3 billion in fiscal 2003 sales. In 1984, the first year that CKE offered franchises, the company also expanded from California into Texas, a venture that lost money from the start. An internal company report was available to Carl Karcher and his brother Don, then president of CKE, who gave 14 relatives advance warning of the bad news. A number of family members, though not the Karcher brothers, sold stock in the company before the news became public, avoiding \$310,000 in losses as share value plummeted. All of the Texas restaurants were sold in 1986, when losses reached \$7.1 million.

A Securities and Exchange Commission (SEC) investigation in 1988, at the height of Wall Street’s insider trading scandal, led to Karcher and six relatives agreeing to pay \$664,000 in fines and reparations while admitting no wrongdoing. Half of the amount was to be paid by Carl Karcher to the government, the remainder by the family to damaged shareholders.

The agreement also protected the Karcher family from criminal charges. Civil charges against other family members, including Carl Karcher’s wife, were dropped. CKE accounting director Alvin DeShano settled similar civil charges for about \$25,000. DeShano, the only CKE defendant also

tried on criminal charges, was acquitted of securities fraud, thanks to a defense that portrayed him as too disorganized to commit fraud effectively.

A second failed expansion, this time into Arizona, led to a dispute with hamburger rival Wendy's over unfair business practices. While existing Carl's Jr. stores in Arizona were losing \$5 million a year, CKE bought 10 Wendy's locations from Wendy's franchisee Ronald Brown. Wendy's sued CKE for \$79 million and Brown for \$40 million, arguing that the sale had been made without their permission. The suit was settled for an undisclosed amount in 1990.

Three years later, Carl Karcher's younger brother Frank sued CKE for \$10 million, claiming the company had deceived him about the value of the 12 Carl's Jr. stores that he bought as franchisee in Arizona in 1990, at the time that CKE was converting all 31 of its money-losing Arizona stores to franchise operations. Frank Karcher claimed that the valuation had been based on a formula not disclosed to him, one that inflated sales and profits by relying on deep discounts to drive purchases up.

#### NEAR BANKRUPTCY

By October 1993, Carl Karcher was no longer chairman of CKE. His failed \$106 million proposal to take the company private left him near bankruptcy. He had attempted to oust his board of directors after they rejected his 1989 plan for joint marketing with Mexican fast food chain Green Burrito. Donald E. Doyle, who had replaced Don Karcher as president of CKE, characterized the Green Burrito proposal as good for the Karcher family but not for shareholders. However, Doyle and new chair William Foley II, one of the Orange County businessmen who bailed out Karcher in return for CKE shares, apparently had some interest in the Green Burrito concept.

In January 1995, Green Burrito sued for over \$100 million, charging that CKE, after successfully opening three co-branded Carl's Jr.-Green Burrito restaurants, had stolen their concept for use in its first Carl's Jr.-Picante Grill. Despite the suit, CKE decided, after a failed venture with Mexican fast food chain Taco Bueno, that green burritos were the future. On March 1, 2002, CKE acquired Santa Barbara Restaurant Group, the parent company of both Green Burrito and "fresh Mex" chain La Salsa. Several suits against CKE for improperly de-

priving restaurant managers of overtime pay were filed in 2001 and 2002. As of CKE's annual report, one suit was asking to be certified as a class action under which multiple managers, not specifically named as complainants, could collect damages.

In September 2003, troubled CKE Restaurants announced its return to profitability, citing premium products such as the Six Dollar Burger as critical to the turnaround. Boycotted by gay rights activists and feminists for Carl Karcher's donations to conservative groups, the company hired Playboy founder Hugh Hefner as spokesperson for extensions of the Six Dollar line, with the motto "Because some guys don't want the same thing day after day."

WENDE VYBORNEY FELLER, PH.D.  
ST. MARY'S COLLEGE OF CALIFORNIA

## Carnegie, Andrew (1835–1919)

KNOWN IN HIS time as "King of the Vulcans," Andrew Carnegie is considered to have been one of the most important figures of the Gilded Age, a

time when a thirst for huge profits held sway over conscience. As one of the so-called robber barons, Carnegie vanquished anyone who stood in his way to profit. At a time when the Sherman Antitrust Act of 1890 banned monopolies in the United States, the Carnegie Steel trust, which controlled the supply, fabrication, and distribution of steel, became a model for other American trusts. When Carnegie decided that he had become rich enough, he divested himself of all steel interests and devoted himself to a life of philanthropy. Carnegie gave away approximately \$310 million to various charities and foundations and is most known for the 2,509 Carnegie libraries he established throughout the world.

During the Civil War, Carnegie devoted himself to his own affairs. He was, therefore, astounded when he was drafted into the Union Army in the summer of 1864. Carnegie followed the common practice of hiring a substitute to take up arms for him. This was accomplished by paying a fee to the federal government and calling on the services of a Pittsburgh draft agent, H.M. Butler, who located a recent Irish immigrant, John Lindow, who was willing to join the army in Carnegie's place for the sum of \$850.

To Carnegie, the Civil War was not about preserving the Union or abolishing slavery, it was about business possibilities. He realized that the metals industries would hold an important place in the future of the United States and decided to devote his energies to becoming a wealthy and successful steel magnate. Carnegie started out by buying an iron-bridge plant and followed this up with the purchase of a plant in Philadelphia, Pennsylvania, that made railroad car axles. He manipulated the buy-out of one partner and united the bridge and axle plants into the Union Iron Mills of Pittsburgh. By the mid-1870s, Carnegie was the sole owner of the company and built his own blast furnace to avoid paying locals for their services. In order to ensure sufficient amounts of fuel to run the furnaces, he invested heavily in the coal and coke monopoly of Henry Clay Frick.

A few years earlier Frick, who became instrumental in Carnegie's plans for substantial expansion, had established the Frick Coke Company. Frick had expanded the original 300 acres of coal land and 50 ovens to 450 acres and 150 ovens. Carnegie was impressed with Frick from the beginning and suggested that they become partners. In

1889, Carnegie, Frick, and Charles Schwab established the Carnegie Steel Company. While the partnership proved financially successful, Carnegie was never comfortable with Frick's lack of moral controls. Frick's manipulations set the stage for an 1892 strike at the Homestead plant of Carnegie Steel, and violence broke out, resulting in the deaths of seven workers. Anarchist Alexander Berkman later tried to assassinate Frick. Carnegie attempted to distance himself from Frick who resigned from Carnegie Steel in 1899.

Anyone interested in the steel-making process during the latter half of the 19th century was aware that Henry Bessemer (1813–98) had discovered a process that used blasts of air on molten steel to remove carbon from the steel. The process allowed steel ingots to be transferred directly from the soaking pits to the rollers. The Bessemer process, patented in 1855, cut the amount of time involved in steel-making and drastically improved the quality of the finished product.

Carnegie was quick to realize the importance of the Bessemer process and set out to undercut the production of rails at the Allegheny Bessemer steel plant, which had begun operating in 1888 in Duquesne, Pennsylvania. Carnegie created a pamphlet that was distributed to railroads throughout the United States warning that far from improving the quality of steel, the Bessemer process would produce defective rails. According to Carnegie's highly biased literature, cutting out the second heating of the steel resulted in a lack of "homogeneity" of the structure of the steel produced. The warning seemed to make a lot of sense, and steel manufacturers reacted by rejecting Allegheny Bessemer steel.

Within the next few years, Carnegie proceeded to expand his steel business on an ends-justifies-the-means basis. By July 1, 1892, Carnegie had developed the capability of producing amounts of steel that were equal to half that produced by all the steel mills in Great Britain, at that time the most highly industrialized nation in the world.

ELIZABETH PURDY, PH.D.  
INDEPENDENT SCHOLAR

## Carson, Rachel (1907–1964)

RACHEL CARSON was thoroughly educated as a biologist. She obtained her education at the Pennsylvania College for Women, the Marine Biological Laboratory at Woods Hole, Massachusetts, and earned her master's degree in zoology from Johns Hopkins University. She worked for the U.S. Bureau of Fisheries (now Fish and Wildlife) for 17 years.

Through her work as a governmental biologist, she studied fish and wildlife and became very knowledgeable of the environmental impacts of pesticides on animal populations. She was particularly interested in the effects of DDT (dichlorodiphenyltrichloroethane) on the environment. It was through her biological and zoological background and negative reports about DDT and other chlorinated hydrocarbons that she began research and writing her now famous book, *Silent Spring*.

DDT was first used as an insecticide in 1939. It was highly effective in eradicating colonies of mosquitoes and their eggs. DDT was also used during World War II by B-25 bombers that sprayed areas of Pacific islands prior to invasions. It was seen as effective in eliminating malaria in the developed world and drastically reduced its existence elsewhere. The problem with DDT was not its effectiveness, but its indiscriminate effectiveness; it killed everything it came in contact with. This was especially disturbing to Carson, because DDT was killing wildlife and was being used all across the United States, even in residential suburbs to eradicate caterpillars, moths, and beetles that carried diseases.

*Silent Spring* was published in 1962 and created an open debate between the public and the pesticide industry. The book helped to educate the public about the potential dangers and effects of pesticides

on humans and wildlife. The public started to question the use of pesticides, their effect on the environment, and became more critical of the industry and the government. Not everyone was convinced of the veracity of Carson's claims, especially those in the pesticide industry. Many in the industry criticized her accusations and, in a very public manner, discredited her knowledge of science. She did not have a Ph.D. and she was a woman. These two factors alone were used against her. But, soon after the book was published, President John F. Kennedy formed a government group to investigate the dangers of pesticides.

In 1963, the President's Science Advisory Committee announced that the claims made in Carson's *Silent Spring* were indeed correct. Her work helped to promote an environmental movement and was influential in the creation of the Environmental Protection Agency. In 1972, DDT was banned from sale in the United States. Carson died of breast cancer in 1964.

Although her life was cut short, she is credited with helping to start the modern environmental movement. *Silent Spring* has been called one of the most influential books of our time. Former Vice President Al Gore, in the introduction to a 1994 reprint, wrote, "Without this book the environmental movement might have long been delayed or never have developed at all."

GRAND VALLEY STATE UNIVERSITY

## Carter, James E. (1924–)

IN 1976, JIMMY Carter, a peanut farmer and the former governor of Georgia, became the 39th president of the United States in the wake of the Water-

gate scandal when American trust in government was at an all-time low. In the election, Carter had challenged Republican Gerald Ford (1913–) who had succeeded to the presidency only two years before when Richard Nixon resigned after being identified as an “un-indicted coconspirator” in the Watergate trials. Carter won the election because he was an outsider with a “squeaky-clean” reputation who was not involved in the Washington political scene.

Carter’s Department of Justice (DOJ) was heavily involved in policing government ethics in wake of the Watergate scandal. Griffin Bell, Carter’s first attorney general, restructured DOJ to serve as a neutral legal entity to ensure that the department was not seen as a tool of the president as it had been under Nixon. Bell also worked with the Federal Bureau of Investigation and the Central Intelligence Agency to improve their efforts at catching white-collar criminals and in polishing their agencies’ tarnished images. Both Bell and Benjamin Civiletti who succeeded him were also involved in pursuing other white-collar criminals for crimes such as securities fraud and money laundering.

## THE CARTER PRESIDENCY

In his Inaugural Address in January 1977, Carter promised the American people that his administration would be both competent and compassionate. He set out almost immediately to accomplish competency through reorganizing the executive branch of government and by reducing waste and inefficiency. While both inflation and the deficit did increase dramatically under Carter, he managed to contain unemployment. In a concentrated effort to control inflation Carter introduced an anti-inflation program that included: decreased federal spending, streamlining of the regulatory process, voluntary wage and price standards, and a tax-based incomes program. The press criticized Carter for not making more of an issue of the voluntary wage and price standards with the public by constant hammering about the importance of compliance. A Price Committee and a Pay Advisory Committee were created to bring business and labor into the effort to control inflation, but little was accomplished.

When Carter’s first major effort at anti-inflation failed, he submitted another bill to Congress that contained: selective credit controls, a balanced budget, a gasoline conservation fee, monetary re-

straints, cuts in regulatory costs, and increased emphasis on wage and price controls. One of Carter’s most successful appointments was also aimed at improving the economy. He chose Paul Volker as Chair of the Federal Reserve Board, a position that Volker held for eight years.

While Carter’s outsider status was an asset as a candidate in the 1976 election, it was a drawback as president because he was unwilling to play the political games that are so much a part of being a successful politician. Carter always tried to do the “right thing,” and he honestly believed that members of Congress should do the same without having their egos stroked on a regular basis. As a result, even the Democrats, who controlled both houses of Congress, refused to back many of his proposals. Carter’s efforts at establishing successful liaisons between members of his staff and Congress were also generally unsuccessful. Carter’s dislike of pork barreling, the practice that allows members of Congress to win support for their own pet projects, was another constant source of irritation with Congress.

In addition to executive reorganization and anti-inflationary measures, Carter’s list of domestic proposals included ethics in government laws, welfare reform, hospital cost containment, an emphasis on education, and a new energy resource maximization package. In fact, Carter often made it clear that in the midst of an energy crisis, his major domestic priority was a new energy policy. While he did not achieve all of his goals in this area, Congress did pass energy bills in 1977 and 1980, and the legislature complied with Carter’s request to create a Department of Energy. The energy package was comprised of windfall tax profits, a program to develop synthetic fuels, standby gasoline rationing, a conservation program, and solar energy initiatives. Carter also achieved success in initiatives toward deregulation. However, Congress failed to approve Carter’s request to create a Consumer Affairs Agency and succeeded in blocking Carter’s tax reforms by referring them to committees where they were buried.

Carter believed that his election had helped the country forget the horrors of Watergate. He also tried to heal some of the wounds of the Vietnam War by granting a qualified amnesty to those who had evaded the draft. The compassionate government that Carter had promised was implemented through his push for welfare reform within the

United States and an emphasis on human rights in foreign policy decisions. Rather than placing an emphasis on the build up of nuclear weapons, Carter led the move toward negotiation of the SALT II agreement, which was signed in Vienna in June 1979. The Salt II Treaty would have limited the arms build up internationally, but it was derailed when the Soviet Union invaded Afghanistan in December 1979, a move that led Carter to boycott the Winter Olympics in 1980 and to invoke a number of economic sanctions against the Soviets.

Without a doubt, Carter's most successful foreign policy effort was the Camp David Accords of September 1978 that brought about a peace agreement between Israel and Egypt after 12 days of negotiation at the presidential retreat. The Accords were signed by Anwar Sadat, the president of Egypt and Menachem Begin, the prime minister of Israel, at the White House on September 1978. Carter would later win the 2002 Nobel Peace Prize for this and similar efforts worldwide after his presidency.

It has been argued by scholars that the most serious mistake of the Carter presidency occurred when he allowed the deposed shah of Iran to seek medical treatment in the United States in 1979, and refused to return him to the Iranians. This move angered the Iranians and led to the taking of 65 United States embassy personnel as hostages in November 1979. The media pounced on the hostage situation, and the result was that the American public began to feel that the hostage situation was the country's number one priority. The media focus constantly reminded the public that the president had not been able to bring about a successful rescue. To enforce their point, every night television cameras showed Iranians burning the American flag and announced how many days the hostages had been held.

As the situation continued, Carter's approval ratings dropped to a low of 21 percent. To show their disapproval of Carter, the Iranians held the hostages until the very moment that Ronald Reagan was sworn in as president. With rare tact, Reagan appointed Carter to the American team that traveled to Germany to welcome the hostages as they debarked from the plane.

An oil embargo and the problems in Iran contributed to an energy shortage that infuriated the American public. The supply of gasoline fell between 10 and 15 percent in June 1979. The oil producing countries announced a 50 percent rate hike.

When an accident occurred in a reactor at Three Mile Island on March 28, 1979, confidence in nuclear energy also fell sharply. Inflation rose to 13.3 percent, compared with the 6 percent of 1977. The deficit rose to 73.8 percent, up from 53.6 when Carter took office. The combination of what the public saw as failed domestic and foreign policy defeated Carter at the polls in November 1980.

## ***caveat emptor***

THE TERM *caveat emptor* derives from the Latin, meaning “let the buyer beware.” It is employed as a warning to consumers that, if they are not vigilant, they are likely to be bilked by any one of thousands of ravenous marketplace predators; be they home-repair salesman, stock market shills, those who offer CDs at bargain rates, or others of the hordes of fraudulent vendors. The issue is whether governmental groups ought to provide protection for unwary consumers or whether they ought to be left to look out for themselves and suffer the consequences.

The popularity of the term *caveat emptor* is seen in the 28,000 entries that can be retrieved from Yahoo! on the internet. Virtually all of the internet links contain warnings about the perils of one or another scam that is being perpetrated on an unknowing public.

Because of its linguistic roots in Latin, *caveat emptor* often is mistakenly assumed to be a product of Roman law. Actually, it first was used in Anglo-American treatises in the 18th century with the introduction of industrialization and mercantilism. Walton Hamilton, a Yale University law professor, pointed out that the idea of *caveat emptor* was created by businessmen on the pretense that there existed a long tradition that required purchasers to be wary.

It was claimed that such an arrangement made for a more alert and more intelligent buying public. But Hamilton demonstrates that this viewpoint was based largely on misinterpretations of old documents. In truth, Hamilton suggests, Roman law and English common law were notably protective of the consumer.

Whatever slight legitimacy the *caveat emptor* principle might ever have enjoyed, it makes little sense in a very complex world in which it has become impossible for a customer to evaluate the adequacy of what is being offered. It may have been possible for farmers to appreciate that a horse said to be seven years old was twice that age. But how many of us can tell if pajamas are dangerously flammable or that a house being purchased has structural flaws not visible to the naked eye?

Because of the increased complexity of human existence, *caveat emptor* has been severely limited and increasing liability for misrepresentation has been placed on sellers. The legal responsibility of

those purveying products has come to be labeled *caveat venditor*, let the seller beware.

## SECURITIES FRAUD

In one area of concern, securities laws exemplify the tendency to impose penalties for fraudulent stock market transactions. The story begins with the chartering of the South Sea Company in London in 1711, one of the first corporations to sell shares. The price of the stock surged wildly through shrewd word-of-mouth advertising, creating a speculative mania. The price was 73 when the stock first was issued; about nine years later it was selling for nearly 2,000. When the stock tumbled dramatically, King George I observed that the swindle had involved “ensnaring and defrauding unwary persons to their utter impoverishment and ruin.” An investigatory committee found evidence of bribes to members of Parliament and other unsavory tactics to artificially inflate the company’s market value artificially. Restrictive laws were enacted to control the selling of corporate shares.

The major move in the United States to brake stock market transactions was the passage of the Securities and Exchange Act in 1934. The U.S. Supreme Court, in several decisions, pointed out how the act sought to hobble the idea of *caveat emptor*. In 1963, for instance, the Court in *SEC v. Capital Gains Research Bureau* (375 U.S. 180), ruled that the restrictions imposed on stock deals should be interpreted “not technically and restrictively, but flexibly to effectuate [the law’s] remedial purpose.” Congress had sought, the court declared, “to substitute a philosophy of full disclosure for the philosophy of *caveat emptor*, and thus to achieve a high standard of business ethics in the securities industry.” In that case, a brokerage firm had purchased stock for its own account and then recommended that its customers buy the same stock as a long-term holding. When the price rose in the short-term, the brokerage house quickly sold its shares. The Supreme Court declared that such behavior violated laws that prohibited any practice that “operates as a fraud or deceit upon any client or prospective client.” The excesses that had brought on the 1933 national economic depression provided the rationale for Congress and the courts to support consumer protection statutes.

In this spirit, the Supreme Court in 2002 upheld a civil judgment against Charles Zindford, a

stock broker, who had obtained the power of attorney to manage the portfolio of an elderly man and his mentally challenged daughter. When the man died some years later, it was found that the funds had been totally depleted, often used by Zindford for his own purposes. Zindford was convicted of wire fraud, a common charge in white-collar crime cases. The Supreme Court, reviewing the case, pointed out that *caveat emptor* no longer was the governing rule; it was Zindford's responsibility to see to the best interests of those who had trusted him.

## Celler-Kefauver Act

PASSED BY THE U.S. CONGRESS in 1950, the Celler-Kefauver Act strengthened previous antitrust legislation by amending sections and adding provisions to the Clayton Antitrust Act of 1914. It made the Clayton Act's anti-merger provisions more applicable and it outlawed more types of illegal inter-corporate holdings, mergers, and acquisitions.

The original antitrust legislation, the Sherman Antitrust Act of 1890, was utilized heavily during Theodore Roosevelt and William Howard Taft administrations. The legislation prohibited any action by private firms that would prevent the regulatory action of the U.S. market system. It encouraged a market system with a significant number of rivals in each industry, ensuring market competition. Empowered by the act, the U.S. attorney general is permitted to bring lawsuits against companies suspected of monopolizing. The act accounted for the historic antitrust cases against American To-

bacco and Standard Oil, resulting in these massive companies being divided into smaller ones.

The Sherman Act was met with controversy and difficulty. Plagued with vague language, the act often proved ineffective because of loopholes, which arose from the language difficulties. For example, the act only outlaws "monopolizing" explicitly in print, but does not ban the existence of a "monopoly," resulting in drawn-out legal battles over the interpretation of these terms.

In 1914, the U.S. Congress attempted to ameliorate the problematic Sherman Act by amending it with the Clayton Antitrust Act. The Clayton Act, composed by U.S. Representative Henry De Lamar Clayton from Alabama, clarified the interpretation difficulties by amending language and added specific examples of illegal actions by companies. Local targeted price-cutting, a type of price discrimination, was outlawed by the Act, along with horizontal mergers and acquisitions, and exclusive dealership agreements.

Soon after the enactment of the Clayton Act, the U.S. Congress established the Federal Trade Commission (FTC) with the passage of the Federal Trade Commission Act of 1914. Authorized to enforce federal legislation, the FTC utilized the antitrust legislation to continue to curb or regulate monopolistic companies. The Clayton Act, however, did not solve all of the difficulties surrounding antitrust legislation. It was necessary for price-discrimination practices to be defined further by the Robinson-Patman Act of 1936 and for powers to prevent illegal mergers and acquisitions to be expanded by the Celler-Kefauver Act of 1950.

### ANTI-MERGER ACT

Often referred to as the Anti-Merger Act, the Celler-Kefauver legislation significantly strengthened powers granted by the Clayton Act to prevent mergers which could possibly result in reduced competition. Whereas the Clayton Act only tried to prevent horizontal mergers, which is the merger of two companies that output similar products, the Celler-Kefauver Act attempted to prevent vertical and conglomerate mergers by forbidding companies from buying assets from competitors when it would result in reduced competition.

Vertical mergers, which occur when a vendor company merges with a customer company, were attacked by government officials under powers

granted by the act because they are thought to create entry barriers, barring fair access of another company with similar products to a possible consumer. Conglomerate mergers, which occur when a company uses its success, resources, and money from one market to attempt to create a monopoly over another, were challenged as well.

## Cendant

HENRY SILVERMAN WAS the toast of Wall Street in late 1997 as he prepared to merge his company HFS, successful franchiser of Avis, Ramada Inns, and real estate brokerage Century 21, with high flying CUC International, a company that sold memberships in discount buying clubs through direct-marketing to form Cendant.

Like many popular Wall Street companies, Silverman's HFS had delivered a 20-percent-plus growth rate through a program of continuous acquisitions. Wall Street rewarded the new deal with a rising stock price for Cendant, with the sexy concept of synergies from feeding HFS customer names into CUC's direct marketing channels. It was not until April 1998 that the new Cendant management discovered that former CUC executives had massively overstated earnings by \$500 million over three years.

Subsequently, Cendant's stock dropped, erasing \$13 billion in market capitalization, and CUC founder Walter A. Forbes resigned. As one commentator noted "once CUC's massive irregularities were uncovered it became clear that its core business, selling memberships was not the profit engine originally expected." Stockholders sued Cendant,

asking how they could have believed the hype, and whether Silverman, known as a savvy deal maker, could have so massively stumbled? Did his due diligence actually fail to uncover the fraud ahead of time, or was he a part of the problem? Inexperienced shareholders, if not professional money managers, were dismayed to discover that because the deal was structured as a merger of equals, HFS did not, in fact, have unlimited access to CUC's accounting books.

So, in effect, it was the ultimate "trust me" deal. Also, sharing at least moral responsibility would seem to be CUC's former accountants Ernst & Young, and investment bankers Bear Sterns which received \$30 million as financial advisers on the merger.

Cendant has come to stand for the system of belief that enabled the growth of the Wall Street "bubble" in the 1990s. HFS wanted to believe that direct marketing of memberships was profitable. Wall Street wanted to believe that a 20 percent growth rate was sustainable, and that with the effect of synergy, Cendant, under its star CEO Silverman, would go on making money at that rate. Cendant settled with shareholders by agreeing in December 1999 to pay \$2.83 billion, without admitting liability, and Silverman went on to rebuild the Cendant company.

Then, as the Enron bankruptcy debacle hit, it became public that like Enron, Cendant also relied on off-balance sheet partnerships, which further tarnished the stock in 2002.

## Centennial Savings and Loan

THE SAVINGS AND LOAN scandal of the 1980s is the greatest white collar-crime in terms of monetary loss to date (2004). Hundreds of institutions collapsed due to illegal and fraudulent transactions.

Savings and loans were created in the 1930s as an alternative to banks that were limited to real estate loans within 50 miles of the institution. Their executives had to be familiar with local property values. Such conservative practices meant depositors were at virtually no risk of losing their money. To insure safety the Savings and Loan Federal Deposit Insurance Corporation was created in 1934 to shield depositors against even a remote chance of loss.

During the late 1970s, deposits were withdrawn from low-interest paying saving accounts when interest rates climbed. Savings and loans were, by law, limited to long-term low-interest real estate loans, making it nearly impossible to survive. Deregulation allowed savings and loans to pay higher interest and make loans for a wider variety of purposes. Deregulation also created the widespread use of brokered deposits or large sums of money placed with the savings and loan that paid the highest interest rate.

The savings and loan scandal was not the work of one institution. The distinction of Centennial Savings & Loan Association of Santa Rosa, California, was the blatant nature of fraud and how rapidly the institution inflated its paper value, making its executives and associates wealthy using brokered deposits. Centennial began in the small California town of Guerneville, California, with capitalization of \$2 million in 1977. The location was poor because real estate was in little demand, and there were few local depositors. Centennial struggled until Erwin "Erv" Hansen, who had a good reputation in the industry, was appointed president in 1980. Under Hansen, Centennial moved to Santa Rosa and started receiving brokered deposits putting hundreds of millions of dollars at his disposal.

In violation of regulations and sound banking practices, deposits were used to make loans to Centennial officials whose names were kept off the books. Funds were spent for the personal benefit of Centennial executives, wasting huge amounts on lavish consumption. A private jet, personal chef, parties, and a \$48,000 desk for Hansen were the tip of the iceberg. Hansen used Centennial's funds to pay for his personal extravagance. Centennial's Executive vice president, Beverly Haines, admitted embezzling \$2.8 million.

Centennial was also involved a link to organized crime, illustrating how legitimate savings and loans were endangered by a business relationship with a

criminal organizations; Centennial's personnel dealt with known organized crime figures. The end came in 1985 when Centennial collapsed losing \$165 million.

## Center for Science in the Public Interest

THE CENTER for Science in the Public Interest (CSPI) was founded in 1971, as one of the public interest groups borne out of the work of Ralph Nader. to study, advocate for and influence legislation to protect consumers. CSPI conducts research on a variety of topics, including food safety, scientific integrity, genetically modified foods, and alcohol. The organization reveals information about the content of products that manufacturers would often like to keep hidden from consumers.

For example, in 2002, the CSPI issued a press release informing consumers of a complaint filed with the Food and Drug Administration, describing how the Ben & Jerry's ice cream company had engaged in a pattern of deceptive advertising in labeling some of its products "all natural." In fact, the consumer group noted that products, labeled "all natural" in reality "contained artificial flavors, hydrogenated oils, or other factory-made substances."

The CSPI has also led an effort to influence the U.S. Congress to pass the Meat and Poultry Pathogen Reduction and Enforcement Act of 2003, which was meant to place stricter limits on contaminated meat entering the human food chain. This act was nicknamed Kevin's Law, after Kevin Michael

Kowalczyk, who died in 2001 at the age of two after consuming a hamburger that was contaminated with *e. coli* bacteria.

Since 1981, the CSPI has led a campaign to inform the public about the risks of drinking alcohol, and to promote its initiative for responsible marketing by alcohol producers. For example, in 2003, the organization fought to prevent a plane bearing the advertising logos of Budweiser Light beer from being placed on display at the National Air and Space Museum of the Smithsonian Institution. Also, the CSPI has advocated for strict limits on how alcohol can be marketed to the general public as well as to youths. CSPI has acted to demonstrate how the U.S. Office of National Drug Policy “spends nearly \$200 million per year on its media campaign, focusing on marijuana, cocaine, heroin, and other drugs, ignoring alcohol, by far the leading drug problem among young people.”

The CSPI has also been a strong advocate against the overuse of antibiotic medicines. They note that doctors often prescribe antibiotics as a “quick fix solution for patients,” although the drugs may not be indicated for treatment of the diagnosed illness. For example, many illnesses such as colds, are caused by viruses which are not treatable using antibiotics, and for which the prescription of antibiotics is inappropriate.

The overuse of antibiotics has led to the development of antibiotic-resistant strains of bacteria, which makes treatment of illnesses, such as tuberculosis, more difficult to treat. CSPI has also advocated for the reduction of antibiotics in livestock production. Many livestock feeds come laced with antibiotics to try to reduce illnesses in the herd. The organization notes that, “Almost half of all antibiotics produced in the U.S. are used in livestock production.” The overuse of antibiotics in livestock production can result in antibiotic-resistant strains of bacteria, and may allow for the introduction of these bacteria into humans.

Funding for the work of CSPI primarily comes from subscriptions to its publication the *Nutrition Action Health* newsletter, which documents the organization’s research and advocacy work. Between 5 and 10 percent of its budget comes from grants given by foundations such as the Robert Wood Johnson and the Rockefeller foundations.

GENERAL EDITOR

## Central America

IN CENTRAL AMERICA, Panama has become notorious as a center of white-collar and organized crime, especially money laundering. Indeed, outside of the United States, Panama is the biggest money laundering center in the Western Hemisphere. More than 100 international banks operate in Panama’s offshore banking system. Much of the money laundering is linked to the international drug trade. In 1993, the Paris-based Observatoire Geopolitique des Drogues (OGD) published a study on the connection of the drug trade and national security in which Panama was classified as a “narco-state” with high-level government officials implicated in illicit activity.

Much of this is due to the nature of the country’s banking system. General Omar Torrijos, leader of the country’s national guard, took power in a 1968 coup. The United States supported the Torrijos government and provided economic aid to Panama. As part of the aid package, the U.S. Agency for International Development sponsored a study that Panama had all of the prerequisites to become an important international banking center. The country possessed excellent communications facilities, it was a transportation hub, and it used U.S. dollars. In response to the U.S. recommendation, the Torrijos government passed legislation that opened the country to foreign banks and allowed for a great degree of secrecy and anonymity. The new banking laws allowed the offshore banking center in Panama to take off.

This system permits secret accounts to be held by both individuals and corporations. Furthermore, Panama’s banking system permits tax-free interest income, attracting account holders from around the world. Also, companies can be organized with no public disclosure of the principals. These bearer’s share companies are “owned” by whoever holds the physical certificate. Often, “strawmen” do the in-

corporation and are the initial shareholders. They then give the certificates to the true owners. The process is often carried out by lawyers who do not even know the real owners. There is little that foreign authorities can do, allowing Panama to become a leader in laundering money from the international drug trade. After passing through Panama, such funds are easily wired to other countries.

Geography and the role of the United States have also contributed to Panama's role as a money-laundering center. The country's proximity to the United States and its location between drug production in South America and drug consumption in North America make it an ideal place for laundering narcotics profits. The construction of the Panama Canal, the subsequent "dollarization" of the economy, and the presence and spending of the U.S. military in the Canal Zone also made Panama a favorable spot for processing funds earned from illicit activities. In addition, Panama has been relatively conflict-free compared to many of its Central American neighbors, providing a more stable environment for financial activity.

#### MANUEL NORIEGA

Much of the organized crime in Panama revolved around Manuel Noriega, the head of the Panama Defense Force (PDF) and the de facto leader of the country after the death of Torrijos in 1981. Noriega maintained tight control over the illegal activities carried out by the PDF and almost nothing was done without his consent. Furthermore, those who did not have the favor of the dictator suffered accordingly. Noriega sometimes sent his henchmen to seize large amounts of cash, in some cases totaling millions of dollars, before it could be laundered. In the cocaine business, Noriega favored Colombia's Medellín cartel, and therefore fed information on the rival Cali cartel to U.S. authorities. He even went so far as to shut down a bank in Panama for money-laundering—a first in the country—because one of the institution's owners was a leader of the Cali cartel.

At the same time, Noriega was able to mask his involvement in the drug trade and money-laundering by acting as a secret partner in Panamanian companies and banks. For example, Noriega and the PDF were linked to freight carriers and airline charter companies that brought money in and out of Panama to be laundered. Through such criminal in-

volvement, Noriega was able to amass a great personal fortune.

Noriega also allowed other money-launderers to operate in Panama as long as they properly paid off the dictator. One of the more well-known examples is that of U.S. marijuana dealer Steven Kalish. By 1983, Kalish was earning such extraordinary amounts of drug profits, he was having difficulty in laundering the cash in the United States and the Cayman Islands. He turned to Panama, and after an initial \$300,000 bribe to Noriega, Kalish was allowed to fly from the United States to Panama under diplomatic cover. Kalish continued to lavish frequent and expensive gifts upon Noriega in exchange for access to the airport in Panama City, where his planes loaded with cash could taxi to a corner of the airport controlled by the military. There, he could unload his drug money into waiting armored cars and take it to deposit in Panama City banks. Kalish continued these covert money-laundering operations until he was arrested in July 1984.

#### OUR MAN IN PANAMA

The United States was generally willing to overlook Noriega's illegal activities due to his cooperation with U.S. military and intelligence anti-communist operations. In particular, during the early 1980s, despite growing concerns about Noriega's money-laundering, the U.S. government looked the other way due to the Panamanian leader's support for the U.S.-backed Contra anti-communist rebels in Nicaragua. In 1986, authorities in the United States began to disclose that Noriega was involved in many illegal activities, ranging from drug-dealing and money-laundering to aiding guerrilla groups and assassinating political opponents. In 1989, the United States invaded Panama, captured Noriega, and sentenced him to jail time in the United States on drug charges. In addition to money-laundering and the drug trade, Panama has also been a center of immigrant smuggling and the production of fraudulent documents. For example, more than 100,000 undocumented Chinese immigrants have passed through Panama and other parts of Central America, including Guatemala and Belize.

#### ENRON AND GUATEMALA

In 2003, the U.S. Senate Finance Committee concluded that the Enron Corporation made more than

\$12 million in questionable payments to a group of businessmen in Guatemala. With the company's first major entry into the Latin American market, Enron hoped that the businessmen could use their contacts with President Jorge Serrano to secure utility contracts. The Texas-Ohio Power Company had signed a 15-year power supply deal with the Empresa Eléctrica de Guatemala. Texas-Ohio then sought out help from Enron in order to finance the project. In addition, the World Bank, the U.S. Department of Transportation Maritime Administration and the Overseas Private Investment Corporation all contributed funds to the endeavor. Texas-Ohio then made a deal with the Sun King Trading Company, a group of four prominent Guatemalan businessmen and one American, who negotiated with high-ranking Guatemalan officials in exchange for a percentage of future revenues. Enron then built a 110-megawatt power plant, placed it on a barge, and stationed it near the Guatemalan city of Puerto Quetzal in order to sell electricity to the government-owned utility.

The Senate investigation found the Sun King Trading Company performed no real services and the payments made to them over a four-year period were nothing more than bribes. The company's basic role was to make connections with the Guatemalan president and convince him to sign the Enron agreement. Under the U.S. Foreign Corrupt Practices Act, U.S. companies are prohibited from paying bribes. Furthermore, Enron disguised the bribes as fuel payments and even tried to claim tax deductions on them. Then in 1995, an Enron whistleblower brought the Guatemala situation to the attention of the Internal Revenue Service. The information was then passed on to the Justice Department and the Securities and Exchange Commission, but no U.S. government agency pursued prosecution against Enron.

## HONDURAS

By the late-1980s, organized crime became a major issue in Honduras, as the country became an important trans-shipment center for the Colombian cocaine cartels. The Colombians took advantage of the relaxed ethical standards of the Honduran military in light of its connection to the U.S. fight against the pro-communist Sandinista regime across the border in Nicaragua. Furthermore, Colombia's Medellín cartel could offer even more money than

the millions of dollars that Honduras received from the United States, supposedly to aid democracy. In addition, the Honduran military had reported links to Panamanian leader Noriega. The country's armed forces also was involved in laundering drug money and using profits from the narcotics trade to pay off political parties

A relatively corrupt civilian government was not interested in investigating the involvement of the Honduran military in organized international crime, nor did the U.S. embassy take much notice, as national security and geopolitical concerns took precedence. Due to the fact that Honduras played the important role as a base for the U.S.-backed Contras who were fighting the Sandinista government in Nicaragua, the U.S. government was willing to look the other way. In addition, the military in Honduras controlled both the police and the country's airports, giving it much latitude in conducting illegal activities.

The military itself had little direct connection to the Colombians. Rather, a Honduran national, Jose Ramon Mata Ballesteros, who had connections to Noriega, acted as a go-between for the Medellín cartel and the Honduran military. Mata was the head of the so-called Padrino trafficking organization that supplied the Colombian drugs to Mexico and the United States. He had spent many years in Colombia and became a very wealthy man. After escaping from jail in Colombia, he returned to Honduras in 1986 because his native country did not have an extradition treaty with the United States, where Mata was a wanted in connection with the murder of U.S. Drug Enforcement Agency agent Enrique Camarena Salazar

While at first the United States ignored the Honduran drug connection, eventually reports surfaced that weapons flowed through the country to leftist groups in El Salvador and Nicaragua, and the United States decided to crack down on the Honduran drug trade. U.S. pressure and factional splits within the armed forces in Honduras led the military to arrest Mata in 1988, and to send him to the United States where he was arrested. Many believe that the Honduran military handed over Mata to satisfy the United States in hopes that there would not be an investigation into the involvement of military officers in the drug business.

Two days after Mata's arrest, a list of military officers reportedly linked to the narcotics trade was made public. This, combined with a growing anti-

American sentiment over the Mata case, a major demonstration took place at the U.S. embassy. At least five people died and an annex at the embassy burned down.

Some claim that the Honduran military organized the demonstration to pressure the United States to drop any potential drug investigation. Others say the demonstration was meant to undermine the authority of the military. Whatever the truth, the government declared a state of emergency in the country's two largest cities.

This action broke the major link between the Colombians and the Honduran military. In addition, U.S. radar installations, previously directed toward use against the Sandinistas, were now used to track drug flights.

The U.S. judicial system sent Mata to a maximum security federal prison on drug charges. However, in Honduras, many still considered him to be a hero to the poor, a Honduran Robin Hood. Worth more than \$1 billion, Mata spent lavishly on schools, hospitals, athletic teams, and community groups. Many poor Hondurans sought and received his help. Authorities argue that Mata was simply a criminal trying to divert attention away from his links to drug cartels in Colombia and Mexico.

## Challenger Disaster

ON JANUARY 28, 1986, only 73 seconds after launching of Mission 51-L, seven crewmembers including a schoolteacher, Christa McAuliffe, died in the explosion of the space shuttle *Challenger*. A

subsequent investigation by the President's Commission on the space shuttle *Challenger* Accident (the Rogers Commission) concluded that the cause of the *Challenger* explosion was the failure of the O-ring pressure seal in the spacecraft's right solid rocket booster.

O-ring seals are designed to prevent hot gases from leaking through the joint during the propellant burn of the rocket motor. However, almost immediately after takeoff the O-ring seals were destroyed allowing hot gases to leak through the right solid rocket motor field joint. In the process, the struts linking the solid booster and the external tank began to weaken. Eventually, the solid rocket booster was allowed to rotate freely and impact the intertank structure and the lower part of the liquid oxygen tank. Continuous structural failure to the hydrogen tank released large amounts of liquid hydrogen. This combination of events created an enormous oxygen-hydrogen explosion that engulfed the *Challenger* within seconds.

The commission's report stated that gray and black smoke emitted from the right solid rocket booster was an indication that grease, joint insulation, and rubber O-rings in the joint seal were being burned and eroded by hot gases. Beyond the technical cause of the explosion, the commission and other scholars maintain several factors contributed significantly to the tragedy including pressure placed on the National Aeronautics and Space Administration (NASA) to sustain a busy launch schedule (15 launches were scheduled for 1986 and another 19 for 1987). Faulty design of the spacecraft, weather temperatures, and a lack of organizational communication also contributed to the crash.

The space shuttle *Challenger*, named after the British Naval vessel HMS *Challenger*, was the second orbiter to become operational at Kennedy Space Center. During the 1960s, NASA enjoyed unlimited political support and financial resources. However by the 1970s, budget constraints and a lack of political and public support dramatically affected NASA's ability to design a fully comprehensive reusable spacecraft. As a result, NASA made several compromises in its spacecraft design, often in favor of cheaper but more dangerous parts. For instance, instead of using safer liquid-fueled engines, NASA used the more volatile solid-fueled rockets. By the 1980s, the Ronald Reagan Administration placed tremendous pressure on NASA to

accelerate the use of the space program for commercial, military, and scientific purposes. This emphasis on a fully operational space shuttle program meant that NASA had to further compromise shuttle designs in order to meet political desires and demands for a rapid launch schedule. The result was a hybrid design of the space shuttle that generally overlooked some safety issues.

As early as 1978, several engineers at NASA's Marshall Space Flight Center expressed concern about Morton Thiokol's design of the field joint. Thiokol was the primary private business contracted by NASA to build the solid rocket booster. Marshall engineers agreed that Thiokol's faulty design could lead to hot gas leaks that would essentially cause catastrophic failure. Indeed, Marshall classified the O-ring seals as "criticality 1" meaning they did not meet space shuttle requirements for adequate failsafe standards. Further tests confirmed Marshall engineers' fears that the secondary O-rings were dysfunctional and subject to extreme erosion and damage. Despite this evidence, Marshall continued to define the problems with the O-rings as an acceptable risk. The *Challenger* was also designed with several used parts. Two of the solid rocket motors had been previously used and had grown in terms of diameter. Consequently, the O-rings designed to prevent seepage or gas leaks did not completely seal the opening.

Weather conditions were also a concern. Engineers at both Thiokol and Marshall discovered that the O-rings did not properly compress and contract in low temperatures. The failure of the O-ring to return to its original rounded shape meant that the gaps in the field joints would not be properly sealed, and thus would allow gases to freely pass through the rocket booster. This became a significant safety factor because, at the time of the *Challenger* launch, temperatures were an uncharacteristically low 36 degrees Fahrenheit.

On the eve of the *Challenger* launch, engineers from Thiokol adamantly expressed their concerns about the cold temperatures to Marshall engineers. Thiokol advised against the launch at temperatures below 53 degrees Fahrenheit because of the potential failure of the O-rings. However, due to intense pressure, Marshall officials insisted on proceeding with the launch of the *Challenger*. The launching of each shuttle became the top priority of the agency; the completion of shuttle launches was essential to the long-term survival of the space program.

Media attention to the *Challenger* launch was usually intense because of the inclusion of McAuliffe as part of the space shuttle crew. This marked the first time that a private citizen would be present on a ride to space. McAuliffe was scheduled to deliver a school lesson from space to millions of students. Also, Reagan was scheduled to give the State of the Union address on the night of the launch. Under these conditions, Marshall officials ignored advice from the Thiokol engineers regarding the safety of the spacecraft under cold weather conditions.

In addition, Marshall officials failed to communicate their concerns about the O-rings, or their knowledge of other potential problems to various departments and officials within NASA. The commission cited Marshall's reluctance to communicate important information as a major reason the *Challenger* launch was allowed to proceed.

## charity fraud

CHARITABLE organizations solicit funds from the public for philanthropic goals such as seeking cures for diseases, or aiding the families of slain police officers. Fraud occurs when donations are solicited in a deceptive manner or are used for purposes never intended by the donors. Charities are also subject to the kinds of fraud that plague all business organizations, such as embezzlement and misappropriation of funds by executives.

It is not always easy to establish and prosecute charity fraud. All scholars would agree that money

solicited by persons or groups that are not legitimate charitable organizations would constitute charity fraud, but the question of fraud is complicated when considering charities that use, for example, a very high percentage of donations for administrative costs or additional fundraising rather than for the charitable cause. These kinds of issues, as well as the very large number of charitable organizations worldwide, make charity fraud difficult to monitor and eradicate.

Fraud affects only a very small percentage of the money Americans donate to charities, which totaled \$212 billion in 2001, according to the Federal Trade Commission, but its effects are damaging far beyond the initial crime. Charity fraud is perceived as a particularly abhorrent kind of deceptive business practice because it abuses the trust of altruistic persons who offer donations with the expectation that they are assisting those in need.

Widespread or infamous cases of charity fraud can result in a lasting backlash because those responsible have manipulated the emotions of donors in order to elicit a donation, leading to anger and disillusionment if it is revealed that the charity and philanthropic promises were invalid. This disillusionment and suspicion caused by fraudulent charitable solicitation or misappropriation of funds has the additional very damaging effect of tainting the fundraising appeals of legitimate charities, which suffer by association with those who defraud donors.

#### SEPTEMBER 11 FRAUD

Incidences of charity fraud are often collected around crises that attract national attention. The September 11, 2001, terrorist attacks resulted in one of the largest outpouring of charitable support in American history; the powerlessness of most Americans in the face of the attacks meant that they wished to help in some way, and for many this entailed a charitable donation.

The United States General Accounting Office estimated that \$2.7 billion was donated to September 11 causes, while the Better Business Bureau placed that number at \$2.8 billion, with about a third of the total money collected going to the Red Cross. The Red Cross came under scrutiny over its use of the funds as significant amounts of Red Cross donations were held in reserve and not distributed to victims' relief efforts. The scale of the

September 11 relief effort made it likely that fraudulent charities would spring up to take advantage of this fervent desire to help, despite the vehement public distaste for such profiteers in a time of crisis.

Investigations by the attorney general of New York garnered a handful of suspicious cases, though none resulted in charges of organized fraud as of late 2003. The U.S. Senate's Committee on Finance tracks the ongoing investigations of fraud related to September 11 charities. Typical cases include charities that have not registered as such, so are suspect in their motivations and mission, and money collected that does not seem to have yet made its way to victims.

#### MISREPRESENTATION

Charities may be guilty of fraud when they mislead donors about the percentage of contributions that is applied to various business expenses, thereby vastly overstating the amount of the contribution that will go to the charitable cause. All charities have some administrative costs, but some charities have exorbitant overhead costs that result in almost none of the donation actually going to the charitable cause.

One recent case involved the charity VietNow, which solicited donations for veterans of the Vietnam War. The Better Business Bureau Wise Giving Alliance (BBB WGA), an oversight organization that monitors charities, determined that 91 percent of donations were being used for additional fundraising, and only 3 percent for charitable purposes. The BBB WGA argued that VietNow should have revealed these percentages to its donors, who may have acted differently if they had this information. It is important to note that high administrative costs, though perhaps reprehensible to donors, are not necessarily in and of themselves prosecutable as fraud. In May 2003, the Supreme Court gave the go-ahead to states to prosecute charities or fundraisers that intentionally misled donors, but affirmed that high administrative costs do not automatically constitute fraud.

Charitable organizations may act in a fraudulent way by misrepresenting themselves or associating themselves in a deliberately vague way with known, famous, charities or governmental associations for the purpose of obtaining donations. An example of this kind of deception on the part of a charity is the case of the Police Survivors Fund. It was estab-

lished in 1999 and disbanded by 2003 when its founder pleaded guilty to various fraud charges. The aim of the Police Survivors Fund was to aid widows and children of police killed on the job.

Though this aim was clearly stated in telephone solicitation calls, other factors were left more vague. Consumers may have been confused by the name of the organization as stated during the telephone solicitations because it sounded official. The actual connection between any municipal police force and the Police Survivors Fund was not made clear to donors, because there was no such sponsorship of the charity by a police force, despite the official-sounding name. The Police Survivors Fund had a fundraising strategy familiar to prosecutors of charity fraud. Fundraisers would tell those who were solicited that the donation was for widows and children. They initially ask for a large sum, such as \$1,000, and then revise it to a lower figure if the potential donor balks, implying that a \$99 donation was the least that could be done for the “widows and children.” The founder of the Police Survivors Fund also used the September 11 terrorist attacks as a marketing tool, mentioning vaguely that his group was coordinating efforts with a “World Trade Center fund” and noting that other donors had given \$911 as a symbolic figure to commemorate the attacks. He collected \$441,000, only \$14,500 of which was actually given to survivors of slain police officers. Fraudulent fundraisers may also intimidate those they call by misrepresenting the result of refusing a donation, using fear (suggesting that police departments will no longer answer calls from the residence of a hesitant donor, for example) or social pressure.

Legitimate and well-meaning charities that do not engage in the practices described above do not necessarily escape charges of fraud, because they may also suffer from mismanagement of funds by charity executives. Perhaps the most famous example of a scandal affecting a well-respected charity is the 1995 case involving the former president of United Way of America, who received a seven-year prison sentence for using money donated to the charity to fund his personal expenses, including lavish vacations and support for mistresses.

## CHARITIES AS VICTIMS

Charities that are constantly seeking new fundraising opportunities may also themselves fall victim to

fraudsters. Many charities depend for fundraising on third-party fundraisers, usually for-profit businesses, which open the door to additional possibilities for fraud. Charities may be victimized by fundraisers that refuse to deliver the donations raised, or alternately will only pass on a much lower percentage of collected funds than originally promised.

Another example of a fraud perpetrated through charities is the mid-1990s case of the Foundation for New Era Philanthropy. It lured investment from charitable organizations by promising a double return on the initial investment. The chief executive of New Era Philanthropy claimed that the returns would come from philanthropists who were seeking organizations for charitable donations, though in truth he was running a pyramid scheme, in which later investments were used to pay off earlier ones. When the company filed for bankruptcy in 1995 it took with it the investments of charitable organizations who could ill afford to lose such large sums of money, especially in the eyes of the donors who were funding the bad investment decision.

The most onerous difficulty in eradicating charity fraud is that a charitable donation is often an impulsive decision, based on information about the charity offered solely at the time of solicitation by the person making the request. In addition, the methods of solicitation used by fraudulent charitable organizations such as direct mail and telephone soliciting are also methods used by legitimate charities. For a person deciding on the spot whether or not to make a donation, it can be daunting to try to determine if the charity is legitimate, if it is well-governed, and if an acceptable percentage of the money it collects is funneled to the charitable cause.

## FIGHTING FRAUD

A key strategy for avoiding charity fraud is the education of potential donors about services provided and percentage of collected funds used for charitable purposes; donors may then make an informed choice about the organizations they wish to support.

The internet has helped enormously in educating donors about legitimate and criminal charitable organizations, because charities and charity oversight organizations are better able to reach concerned donors and disseminate information on a scale far beyond what was possible in the past.

Charities often attempt to distinguish themselves from illicit organizations by including information in their solicitations about their activities and overhead costs, understanding that trust is a crucial issue when it comes to charitable fundraising. It is important also that this information about charities is readily available because donors are often not knowledgeable, savvy, or willing enough to do the research needed to seek out this kind of information.

Charity monitoring organizations also play an important role in eradicating fraud and providing information to donors about charities. There are a number of oversight organizations that attempt to educate and protect the public from charity fraud. The American Institute for Philanthropy publishes ratings for charities on its website, ranging from an A for excellent to a grade of F for poor ([www.charitywatch.org](http://www.charitywatch.org)).

Another such oversight organization is the Better Business Bureau Wise Giving Alliance (BBB WGA) mentioned above. Formed by the 2001 merger of the National Charities Information Bureau and the Philanthropy Advisory Service of the Council of Better Business Bureaus, it has established guidelines for charitable organizations. The BBB WGA Standards for Charitable Solicitations require: that solicitations are accurate and truthful, and not misleading; that they offer a clear description of the programs that will be funded by the donation; that it should be at all times clear during the solicitation what the organization is, what the relationship between the solicitor and the organization is, and how the funds donated will be used.

These guidelines also indicate that fundraising should not be done with excessive pressure, and that charities should have an active and independent governing body that includes at least three persons who meet at least three times annually. The BBB WGA conducts investigations of charities and publishes research reports on its website ([www.give.org](http://www.give.org)); a very large number of charities are covered and donors may conduct a search to determine the credibility and statistics associated with a particular charity.

But oversight organizations are in a bind because all charities depend on the sympathy and impulsive generosity of donors. In order to eradicate fraud, charities must insist that the donation not be impulsive but rather well-researched. In general, oversight organizations recommend that prior to

giving, donors should request a copy of an annual report or a financial statement; write checks only to the charity, never to an individual; and never give cash, because it does not leave a paperwork trail. In general, at least 65 percent of contributions should be funneled to the charitable cause, rather than for overhead costs, such as salaries for charity employees, mailings, and start-up expenses.

Federal and state governments and governmental associations also play a role in eradicating charity fraud. For example, the Federal Trade Commission collects information on charity fraud, and publishes a guide called *Charitable Donations: Give or Take?* on its website ([www.ftc.gov](http://www.ftc.gov)). The U.S. Postal Service also has an information program about charity fraud, since many charitable appeals are routed through the U.S. mail. In the past the Postal Service has sent out postcards to consumers warning them about the kinds of fraudulent charitable requests that may appear through the mail. State governments also have material to educate donors about charity fraud on their official websites.

Charitable organizations play a crucial role in the social structure of a democratic society. Despite all of the correctives listed above, fraud will likely continue to be perpetrated by illegitimate or ill-meaning charitable organizations. Victims of charity fraud will continue to be generous with their donations, because they are attracted by an appeal that plays on their emotions at a time when they are perhaps otherwise distracted and unable to do the research required to determine if a given charity is worthy.

UNIVERSITY OF CALIFORNIA, SAN DIEGO

## check kiting

CHECK KITING IS A FRAUD committed against a banking institution, in which the underlying premise is to gain access to deposited funds before they are collected from the institution upon which they are drawn. The scam usually involves several checking accounts spread between several banks. In effect, a bank deposits money into an account while waiting for cash to be processed from another account; while in actuality the other account holds no money. An example of check kiting would be as follows:

*Monday.* A prospective check-kiter deposits a \$500 check from account A into account B; then shortly thereafter deposits a \$500 check from account B into account A.

*Tuesday.* Another round of deposits are made as well as some partial withdrawals.

*Wednesday.* One bank collects its monies from account A, while another collects its monies from account B. There is no actual money in either account, with all checks being drawn on insufficient funds, just a float of alleged funds being transferred back and forth between the two accounts. The check-kiter creates fictional balances in each account where none exists to obtain the use of the cash balances. The process of kiting is an extension of a shell game, moving the prize (the alleged cash balance) from one shell to another. Only when the process is halted, either by an alert banking institution or by the kiter, is it discovered that no monies exist. It is all a con.

As the kiting process continues, the dollar amount rises, as well as the number of accounts. A recent case in Michigan involved 21 accounts and a \$32 million loss. Affected banks are under no obligation to advise another bank of a possible kiting scam, as the last bank holding the checks is the banking institution that incurs the loss. According to the Office of the Comptroller of the Currency,

banks incur approximately \$12 billion losses annually from check kiting scams. Some would interpret this calculated use of the Expedited Funds Availability Act as aggressive cash-management; while others would declare it a criminal act.

Indications of a potential check kiting operation include: Several accounts owned, or controlled by, the same individual; identifiable patterns of transactions, including deposits, transfers, and withdrawals between those accounts; deposits drawn on other institutions by the same holder of the accounts the funds are being deposited to; and frequent inquiries into account balances, collected items, and cleared items.

Changes in applicable federal statutes (1990 amendment to Section 1344 of Title 18, U.S. Code) reduce the burden of proof in prosecuting check kiting, removing both the issue of intent and accepted complicity by the banking institution.

LOYOLA UNIVERSITY NEW ORLEANS

## Chem-Bio

MISTAKES IN interpreting pap smears at this Wisconsin laboratory cost two lives, resulting in the first case of criminal prosecution for lab errors. In 1996, the lab was fined \$20,000 for missing signs of the cervical cancer that killed Dolores Geary and Karin Smith. Family Health Plan, a regional health maintenance organization (HMO) contracted with Chem-Bio for processing of medical samples.

Questions would later be asked about the influence of one Chem-Bio co-owner, Dr. Robert Lipo, who also sat on the board of Family Health Plan. The tests processed by Chem-Bio included routine Pap smears: testing of cells scraped from the cervix for signs of cervical cancer. With early detection,

cervical cancer is virtually always curable, according to the National Cervical Cancer Coalition.

Chem-Bio's labs, also supervised by Lipo, seemed to meet the HMO's needs for speed, efficiency, and low cost. One source of Chem-Bio's efficiency may have been a policy of paying cytotechnologists, such as June Fricano, on a piecework basis, with pay depending on the number of slides processed. Fricano, who had more than 25 years of experience, claimed to be able to read between 180 and 200 slides per day, well above the number suggested by professional guidelines. It was Fricano who misread Geary's 1987 and 1990 Pap smears, Smith's 1988 and 1989 pap smears, and Smith's 1989 and 1990 biopsies. Both women had cervical cancer that was not diagnosed until it was too far advanced for effective treatment. "There is strong evidence she [Fricano] never read any of the slides from Dolores Geary or Karin Smith," declared Circuit Judge David Hansher in sentencing the Chem-Bio for reckless homicide.

#### CHARGES FILED

Criminal charges against Chem-Bio were the last step in the long road of litigation. In 1991, Geary, Smith, and their families filed civil charges for medical malpractice against Chem-Bio, Family Health Plan, and other defendants. Each family settled out of court: the Gearys for \$3.5 million and the Smiths for \$6.3 million. Only after the 1993 death of Geary, a 40-year-old mother of three, and the 1995 death of Smith, a 29-year-old accountant, did the Milwaukee County District Attorney consider criminal charges against Chem-Bio.

At an inquest hearing in April 1995, experts testified that the disputed slides showed clear evidence of cervical cancer. The six-person jury recommended pressing reckless homicide charges against the company and, separately, against Lipo and Fricano. Chem-Bio pled no-contest in December 1995. The state appeals court refused to hear Chem-Bio's request for dismissal on the grounds that a corporation could not be charged with homicide. In February 1996, Judge Hansher exacted the harshest financial penalty allowed by statute: \$10,000 per victim. Hansher characterized the penalty as "absolutely inadequate."

Milwaukee County District Attorney E. Michael McCann boasted that he had been officially censured by the Medical Society of the State

of Illinois. Lipo and Fricano avoided prosecution by negotiating agreements with McCann. Lipo promised that he would not supervise tissue testing or act as a lab medical director for six years. By 1997, he was teaching in the Department of Pathology at the Medical College of Wisconsin. Fricano, who had already found employment at another lab, promised to take additional training and to refuse any position that involved payment by the slide.

Although medical ethicist Arthur Caplan predicted in the *Los Angeles Times* a "criminal prosecution crisis" that would push doctors and HMOs to "the edge of complete paranoia," similar cases have remained rare.

WENDE VYBORNEY FELLER, PH.D.  
ST. MARY'S COLLEGE OF CALIFORNIA

## Chevron

CHEVRON, or ChevronTexaco since the merger with Texaco in 2001, describes itself as an integrated energy company based on oil-equivalent reserves and production, and is the second largest U.S.-based integrated oil, gas, and chemical company. As of September 2003, the company was the world's fourth largest publicly-traded oil major active in more than 180 countries, employing just over 50,000 people.

Worldwide, the company operates 23 wholly owned and joint-venture oil refineries, and 32 chemical manufacturing sites through a 50-50 joint venture with ConocoPhillips. It has acquired the reputation of being one of the most conservative oil companies. Like many oil companies, Chevron has been accused of illegal price-fixing, tax evasion

and contravening environmental regulations. According to the U.S. Public Interest Research Group, Chevron paid more than \$70 million in fines, settlements and penalties between 1980 and 2001. The company's participation in a consortium seeking permission to drill in the Arctic National Wildlife Refuge has attracted the ire of conservation and environmental movements in the United States. Consequently, Chevron's record on health, safety, and environmental issues has come under close scrutiny.

Chevron traces its origins to the Pacific Coast Oil Company founded in 1879 by San Francisco businessman Charles N. Felton. In 1900, the Board agreed to sell the company to the Standard Oil Company of Indiana, part of John D. Rockefeller's Standard Oil Trust. In 1906, the Standard Oil Trust consolidated its West Coast holdings, forming the Standard Oil Company (California). In 1911, the company regained its independence after the breakup of the Standard Oil Trust. In 1926, the company merged with the Pacific Oil Company, renaming itself the Standard Oil Company of California or Socal. The need to secure oil supplies and the perceived U.S. energy crisis after World War I forced the company to increase exploration activity both inside and outside the United States.

## ARABIAN OIL

In 1928, the company bought an oil concession in Bahrain from Gulf Oil, and struck oil in 1932. The company secured an oil concession in neighboring Saudi Arabia in 1932, forming California Arabian Standard Oil Company (Casoc) to operate the concession. Casoc struck oil in 1938. Although the company was a major player in the oilfields of California, Texas, and the Gulf of Mexico, the Saudi Arabian fields remained the company's main source of crude oil until 1980. Socal did not have enough outlets to sell its Saudi Arabian oil so the company formed a joint marketing company with Texaco called Caltex.

In the late 1970s, Socal executives believed the long-term future for oil companies was bleak, but was slow to diversify into other businesses. The company launched an unsuccessful bid in 1979 for the mining company AMAX. A similar bid failed two years later. The company did, however, redefine itself as an energy company, diversifying into uranium mining among other things. The environmen-

tal legacy of the company's uranium milling activities at Panna Maria, Texas (1979–92) remains the subject of controversy. Local campaigners suggest the company used the site as an unlicensed radioactive waste dump.

In 1984 Socal merged with Gulf Oil, rescuing Gulf from a hostile takeover by T. Boone Pickens. The new company, Chevron, was criticized for maintaining operations in South Africa and Angola by both anti-apartheid activists and conservatives. Chevron also inherited Gulf Oil's operations in Nigeria. Like Shell, the other major operator in the area, Chevron has been accused of complicity in human rights violations. In May 1998, Chevron flew members of the Nigerian Navy and Mobile Police to protect one of its oil platforms in the Niger delta. Three days earlier, 121 protesters from local communities occupied the platform to protest against the environmental damage caused by the company's operations and the failure of the company to contribute to development in the Niger delta. The troops and the police shot at the protesters, killing two and wounding many more, while regaining control of the platform.

## CHEVRON CASE STUDIES

In 1988, four years after the merger with Gulf Oil, Chevron acquired Tenneco's oil and gas reserves in the Gulf of Mexico in an attempt to compensate for the loss of their assets in Saudi Arabia after the Saudi government nationalized the industry in 1980. According to the Public Interest Research Group, Chevron's operations in the Gulf of Mexico have a poor safety record. Between 1956 and 1989 offshore rigs operated by Chevron have experienced 10 gas blowouts, 65 fires and explosions, 14 significant pollution incidents, 40 major pollution incidents and five pipeline breaks or leaks.

The study, *Big Spillers*, published by Essential Information in 1989, confirmed Chevron's reputation as the biggest spiller of oil. Between 1984 and 1989, Chevron spilled a total of 2.8 million gallons of oil, excluding millions of gallons that leaked from the company's El Segundo refinery into the underground water table. Eighteen years earlier, two Socal tankers collided near the Golden Gate Bridge, spilling approximately 840,000 gallons of oil into the San Francisco Bay.

Private individuals and regulatory authorities have regularly taken Chevron to court for oil spills,

drilling pollution, hazardous waste violations, and illegal air and water pollution since the mid-1980s. In 1992, a refinery pipeline broke at the Kenai terminal owned by Atlantic Richfield (ARCO) and Chevron, spilling 47,000 gallons of a North Slope crude oil-water mix into Cook Inlet, Alaska. Frozen water in the tank prevented a helicopter spray of dispersants; only 2,400 gallons of oil were recovered. The companies had to pay a \$90,000 fine to the State of Alaska. In May 1992, the president of Chevron USA appeared in federal court to plead guilty to 65 violations of the Clean Water Act, for illegal discharges from platforms off the California coast and paid \$6.5 million in criminal fines and \$1.5 million in civil fines.

Officials from the Environmental Protection Administration (EPA) found that Platform Grace, a Chevron drilling platform in the Santa Barbara channel, was discharging oil and grease in wastewater that exceeded limits in its federal permit. Chevron also admitted to diluting wastewater prior to its being sampled, so as to understate the actual amount of oil and grease discharge, which it reported to the EPA. As of 2001, the EPA listed Chevron as a "potentially responsible party" for 49 hazardous waste Superfund sites, more than any other oil company. In August 2000, Chevron paid a record \$7 million dollars to settle claims that it violated the Clean Air Act at its offshore loading terminal near El Segundo, California. The settlement includes a \$6 million penalty, the highest ever paid under the Clean Air Act for a single facility, and environmental projects valued at \$1 million.

During the past two decades, Chevron has also been accused of illegal price-fixing and tax evasion. In July 1981, Social reached an out-of-court settlement with the Justice Department over allegations that the company of evaded oil price control overcharging consumers between 1973 and 1981. Social paid \$82.5 million but did not admit any wrongdoing. The Internal Revenue Service charged Chevron and the other companies involved in Aramco with evading taxes during the period 1979-81. According to the IRS, the companies bought Saudi Arabian crude oil for considerably less than the market rate, routed it through their foreign subsidiaries and marked up the price to avoid paying the full-rate of tax on profits from selling the oil.

During the 1990s the federal government and various states also accused Chevron and other oil companies of evading oil royalty payments by un-

dervaluing oil produced on land leased from federal or state authorities and overvaluing the cost of transporting the oil. Chevron has settled many of these claims.

## China

THE CONTEMPORARY history of China has seen the adoption of new economic and social policies to facilitate the switch to a market-based economy and opening China to the outside world. Such policies have brought great changes in every sphere of work. The problem of white-collar and corporate crime is becoming a major public concern since China implemented the economic reform and "open door" policies in the late 1970s and early 1980s. By Chinese definitions, white-collar and corporate crimes, usually called economic crimes, refer

to activities by various illegal means in diverse links of the so-called socialist market economy, such as producing and marketing fake or substandard goods, selling smuggled goods, disrupting the order of administration of companies, disrupting the order of financial administration, financial fraud, jeopardizing administration of tax collection, intellectual property crimes, and disrupting market order. Also included are such lawbreaking conducts as property fraud, graft, offering or accepting bribes, embezzlement, dereliction of duty, environmental crimes, and various organized business crimes.

### CRIME AND COMMUNISM

The problem of white-collar and corporate crime is serious in China as it has eroded the Chinese communist regime over 50 years. The incidence of economic crimes in China were present in the early stages Chinese communism. On December 29, 1951, the National Committee of the Chinese People's Political Consultative Conference issued a "directive on the production increase and austerity movement and anti-corruption, anti-waste and anti-bureaucratic struggles." The directive admitted that in barely two years, from October 1949 when the communist regime was established to 1951, the rampage of corruption, wastefulness, and bureaucratism has "developed to relatively serious proportions." The "three-anti" campaign exposed and punished a number of perpetrators.

A major case of economic crime prosecuted during the period was the celebrated corruption case of Tianjin party committee secretary Liu Qingshan and deputy secretary Zhang Zishan. Using political privileges and their responsible government positions, the duo of Liu and Zhang stole a total of 15.55 billion RMB yuan, by taking funds for building an airport, selling food intended for relief disaster-stricken people, exploiting and withholding back wages for civilian workers, and getting loans from a bank through fraud. In February 1952, the Provisional Court of the Hebei Provincial People's Court sentenced them to death.

Despite vigorous efforts during the "three-anti" period to fight graft, wastefulness, and bureaucracy, the struggle had only turned up several symbolic cases of crimes without getting at the root cause. More than 50 years later, the problem is still bothering the Chinese government with increasing inten-

sity, particularly economic offenses centered around organized and business crimes. It is extremely difficult to measure accurately how widespread white-collar and corporate crimes are in China, because statistical data has long been an instrument of political propaganda and manipulation, or not available at all. However, the limited official statistics do indicate the size of the challenge facing the authorities and how deep corruption has burrowed into the bureaucracy.

In the five years from 1997 to 2002, courts handled 118,692 cases of white-collar crime by public officials including embezzlement, bribery, and misappropriation of public funds. In that time, the courts handed down 118,482 sentences for offenses. Those sentenced by the courts included 19 provincial or ministerial-level officials, 318 department or bureau-level officials, and 2,031 county or office-level officials.

A major characteristic of white-collar and corporate crime in China is the gigantic web of government and party officials, corporate executives, and criminal organizations that work together in committing crimes. With the assistance of government and party officials, a number of business executives have stolen large sums of money from banks, state-owned businesses, state funds, and investors.

Business people, for their part, pay bribes to buy political protection for misdeeds, such as tax evasion or misappropriation of public assets. Bribes secure lucrative land deals, government contracts, rights to buy state enterprises at cut-rate prices, and even choice government and People's Congress positions. For businessmen, an official on the take is what Chinese call "a mountain to lean against." Business people know that if they have bought political backing, they can get investigations into their affairs called off and stories in the state media killed. The cases that are made public are the minority, in which an official or a businessman's political backing collapses. Sometimes that happens because the lawbreaking has gone so far that it threatens the political survival of a protector.

### CRIMINAL LAW

This important factor partly explains why white-collar and corporate crimes are increasing rapidly despite the Chinese penal system where relatively minor economic crimes can bring the death penalty. In China, most white-collar and corporate crimes

are listed under Chinese criminal law, which is primarily enforced by national, provincial, and municipal police departments. The people's protectorates are responsible for directly investigating crimes committed by party and government officials such as embezzlement, bribery, and dereliction of duty. However, not all cases of white-collar and corporate crimes go through criminal proceedings. Depending upon the nature of the case and the amount of money is involved, a number of white-collar crimes are dealt with by a wide variety of national, provincial, and municipal administrative laws.

In such a case, enforcement is the responsibility of administrative regulators who generally have fewer powers than police to detain suspects and search for evidence, and who normally impose a moderate fine on a culprit. Furthermore, probes of party officials who break the law begin with investigations by party discipline teams outside the criminal justice system.

The teams can choose to hand their targets on to judicial authorities for prosecution, or simply recommend a reprimand within the party. Many cases of white-collar crime committed by party officials, however, never reach the courts. In the years from 1992 to 1997, party discipline teams in China handled 670,100 cases of white-collar crime by party officials including embezzlement, bribery, and misappropriation of public funds, of which only about two percent ended with criminal punishment.

## INSIDER TRADING

One of the most sensational and widespread types of white-collar business crime in China involves trading stocks based on material non-public information, insider trading. Criminal law (article 180) deems illegal insider trading to be a criminal offense and establishes graduated penalties for insider trading based upon the amount of money involved, with maximum fines of 500 percent as high as the illegal proceeds, and the maximum jail term of 10 years for individuals in especially serious cases.

Although China has criminalized insider trading in a more severe way than many other countries by legislation, the enforcement has done little to eradicate what has become an entrenched feature of the Chinese securities market. To date there has been only one successful prosecution for insider trading, where Ye Huanbao, former chairman of

Shenzhen Real Estate Group, was given a three-year sentence and 800,000 RMB yuan fine, but was out on appeal in 2003.

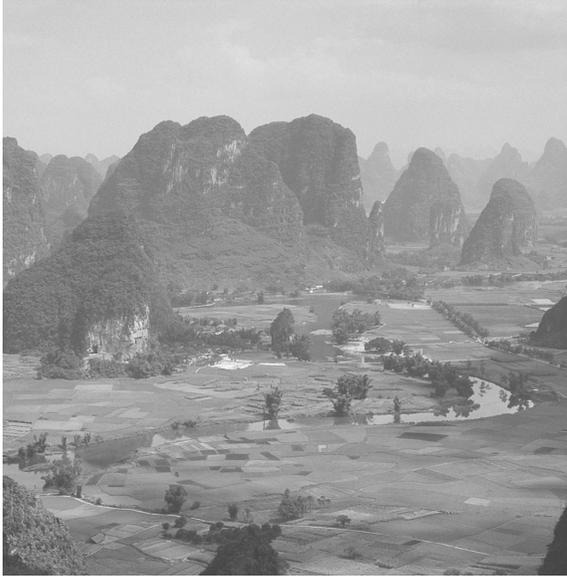

The Chinese Securities Regulatory Commission (CSRC) receives many more complaints than it can investigate, so it chooses only the most serious and significant for prosecution. Although the CSRC vowed to fight insider trading, only nine cases have been brought forward administratively under the insider trading provisions of the securities statutes since the first enactment of securities legislation in 1990. Of these, one accused was discharged for insider trading, one (a major corporation) was confiscated of the illegal gains, and seven accused individuals and corporations were fined by the CSRC amounts ranging from 50,000 RMB yuan to 2 million RMB yuan. Illegal insider trading can net the offending individuals and companies several million dollars per year in profits, so such fines are unlikely to be effective deterrents (1 yuan equals roughly 10 cents).

## ORGANIZED CRIME

As China opened its economy, organized business crime in China emerged from the special economic zones, and then extended to the hinterland areas. Criminal organizations continue in the 2000s taking shape along the southeast coastal areas and border provinces. Though most Chinese criminal organizations remain small, some in the bigger cities have become larger and more sophisticated with more members, a clearer command structure and, above all, political backing by corrupt officials.

One major characteristic of organized crime in China is the exchange of power and money. Some ringleaders move from the open to underground, and some infiltrate into the financial field under legal identity, as in the construction industry, stock transaction, and various trades. Chinese police sources indicate that criminal groups in inland China are beginning to be increasingly involved in business crimes, and are seeking to internationalize their operations.

One of the business crimes the criminal groups specialize in is smuggling. According to Chinese criminal law, smuggling is a criminal offense if more than 50,000 RMB yuan are involved, under articles 151 to 157, and especially serious cases of smuggling can bring the death penalty. There is little public evidence that the death penalty is effective in

*As China opened its economy, business crime moved from special economic zones to hinterland villages.*

combating smuggling and other business offenses. Moreover, enforcement is not frequent and consistent all the time. While there were some scapegoats sentenced to death for smuggling, a large number of such offenses (even if more than 50,000 RMB yuan are involved) are only subject to small administrative fines under the provisions of the customs law. There had been 253,000 smuggling cases investigated under the customs law from 1980 to 1990. Of these, only 3,516 cases (1.39 percent) were convicted by the court. The inconsistent enforcement and small fines are unlikely to effectively deter smugglers, compared to millions of dollars they can make in profits.

Like many other countries that have formulated provisions for the offense of money-laundering in their criminal laws, such provisions have been included in Chinese criminal law. Criminal punishment has been prescribed for money-laundering which is committed to cover-up or conceal the source and nature of the unlawful income or profits obtained from the obvious offenses of drug trafficking, offenses committed by organizations in the nature of criminal syndicate, or offenses of smuggling. There are some defects in China's laws relating to money-laundering. It is incomplete to define it only as drugs, criminal gangs, and smuggling, because a large part of the money-laundering cases in-

volve corrupt officials who channel capital to overseas countries. Inside sources say money-laundering on the Chinese mainland must be up to a yearly sum of RMB 200 billion RMB yuan, a figure equal to two percent of the nation's gross domestic product, or a near equivalent of US\$22.5 billion of the country's export earnings in 2001.

Other prevalent business crimes in China include fraud by bogus checks, deceptive contracts, taxation fraud, computer-related fraud, unsafe working conditions, fake trademark, fake medicine, fake food, and others. As the market-oriented economy takes hold in China, the last few years have seen white-collar offenders seeking loopholes in the legislation on economic development, and to exploit the imperfections in the market administration.

#### CORPORATE CRIME LAWS

Besides the laws discussed above, a number of laws directed at white-collar and corporate crime have been made in recent years, including the Company Law (articles 206 to 228, preventing false statements at the time of application of an enterprise, commercial bribery and other corporate illegalities); the Commercial Banking Law (articles 73 to 86, preventing loan, investment and other banking frauds); the Insurance Law (articles 138 to 152, preventing insurance fraud); the Competition Law (preventing false advertising, fake trademarks, conspiracies and other unfair business practices); the Quality of Products Law (preventing the sale of harmful and dangerous items); the Tax Collection Law and the Personal Income Tax Law (preventing tax evasion); the Labor Law (ensuring that workers are not exploited); the Safe Production Law (protecting workers from unsafe working conditions); and the Environmental Protection Law. However, these laws are not always strictly enforced.

Authorities prefer persuasion behind closed doors first before the case is formally dealt with, and criminal sanctions as a last resort. Many corrupt officials interfere with legal proceedings of white-collar and corporate crime cases. When cases do go to court, offenders are much less likely to receive jail terms than street criminals. In the early 2000s, China intensified its crackdown on white-collar crime. The Chinese courts convicted nearly 90,000 people over five years on charges including embezzlement, fraud, tax evasion, counterfeiting—

a rise of more than 30 percent more over the previous five-year period. Noted officials who got tangled in the iron net of the law included former vice-chairman of the Ninth National People's Congress Standing Committee, Cheng Kejie (executed in 2000 for taking 41 million RMB yuan in bribes), former deputy governor of China's Jiangxi province, Hu Changqing (executed in 2000 for taking 5.4 million RMB yuan in bribes and possessing 1.6 million RMB yuan worth of property from unidentified sources), and former vice minister of the Ministry of Public Security, Li Jizhou (sentenced to death with a two-year suspension in 2001 for accepting more than 4 million RMB yuan in bribes in connection with the huge Xiamen smuggling case).

However, small fry made up most of the convictions. Since China established a unified anti-smuggling system in 1998, law enforcement departments and the Administration for Industry and Commerce have taken a major role in anti-smuggling. During the three years from 1999 through 2001, there had been 37,554 smuggling cases investigated by customs, involving 22.2 billion RMB yuan. During this time, 6,644 smugglers were administratively charged, 6,284 criminally prosecuted. It is not clear so far from these figures if this reform can control the prevalence and rise of white-collar and corporate crime in China.

## cigarette advertising

IN THE 1980s and 1990s, the duplicitous behavior of the tobacco industry increasingly attracted public criticism and was exposed in several trials and lawsuits. Vast sectors of the public opinion questioned the legality of smoking, and thus questioned its advertising: why should a deadly product be marketed as a pleasurable commodity? On the other hand, a considerable number of people felt that the demand for an increased regulation of smoking was an infringement on their freedom of choice. Bans on cigarette advertising, they claimed, conflicted with the 1st Amendment to the Constitution. The battle over tobacco products and their marketing rages on and, significantly, this debate has spread outside legal courts into popular culture, from the cartoon strips by G. B. Trudeau and the popular, Oscar-nominated film *The Insider* (1999), starring the actor Russell Crowe fighting against the beasts of the tobacco industry.

To those who argue for stricter regulation of the tobacco industry, cigarette advertising is synonymous with deceptive advertising, and thus with crime. Various sources have stressed that the tobacco industry's conduct has been extremely misleading. While all its internal papers and documents from the 1950s onward have acknowledged that smoking is addictive and that use of tobacco products causes cancer and death, the industry has adopted a range of advertising tactics which rejected its own findings. The aim of these campaigns has been to convince the public that there is still doubt about the harmful effects of tobacco or that the effects have been exaggerated.

In this way, argue those in favor of a ban on cigarettes and their advertising, the industry is simply trying to keep its profits, stop harsher government legislation and discourage lawsuits from patients suffering from supposedly tobacco-induced illnesses. An important collection of documents internal to the tobacco industry which would support this view is published under the collective name of *The Cigarette Papers* (1996).

The documents were originally sent to Professor Stanton Glantz at the University of California, San Francisco. The sender remained anonymous and only identified itself as Mr. Butts, the nightmarish character in Gary Trudeau's *Doonesbury* cartoon strip embodying Mike Doonesbury's sense of guilt for considering to work on cigarette advertising.

Although concerns about cigarettes and their advertising have become particularly prominent since the 1970s, the history of cigarette advertising has always been caught between the dichotomy of pleasure and danger. The first promotion scheme for cigarettes dates back to 1875 when producers Allen & Ginter introduced in their cigarette brands, Richmond Straight Cut No. 1 and Pet, picture cards to harden the pack and protect the cigarettes. The cards featured photos of actresses, baseball players, Native American chiefs, and boxers and were extremely popular.

Yet, even from these early times, smoking was a controversial issue. In 1898, Tennessee Supreme Court banned cigarettes, ruling that they were “not legitimate articles of commerce, being wholly noxious and deleterious to health” and indicting their use as “always harmful.” Washington, Iowa, Tennessee and North Dakota outlawed the sale of cigarettes in 1900. These concerns about how healthy smoking actually was reflected on advertising campaigns: the baseball player Honus Wagner ordered American Tobacco Company to take his picture off their Sweet Caporal cigarette packs, fearing it would lead children to smoke.

## EARLY ADVERTISING

The tobacco industry used advertising to appease these public concerns over possible health problems due to smoking. Cigarettes were marketed as giving extra protection against colds. From 1933 to the 1950s, the *Journal of the American Medical Association* regularly published cigarette advertisements. In addition, images of doctors would figure prominently on advertising and cigarette packets, in a striking contrast with the health warnings that would start to in the 1990s.

In 1953, the tobacco company Lorillard launched the Micronite filter, marketing it as a guarantee of “the greatest health protection in cigarette history.” Yet, this also turned out to be deceptive as it was discovered the filter was made of asbestos, and its use was discontinued four years after its promotion. In the later 1950s, the advertising strategies of cigarette producers changed: health issues were silenced to focus exclusively on flavor. These were the years in which, thanks to a successful marketing campaign, Marlboro started to occupy an increasingly large part of the market. Significantly, Marlboro’s advertising slogans (“Delivers the Goods on

Flavor,” “Come to where the flavor is. Come to Marlboro Country”) reflected the shift from health to taste benefits.

Some cigarette advertising campaigns have been addressed, implicitly or explicitly, to specific social groups. Women were heavily targeted in the first half of the 20th century and advertisements reassured them that there was nothing morally wrong in smoking. “Has smoking any more to do with a woman’s morals than has the color of her hair?” read a Marlboro slogan from the 1920s. More problematic have been campaigns addressed covertly to children. In 1987, Camel started to use Joe Camel, a cartoon character, in their advertisements.

Several researches showed that 91 percent of six-year-olds recognized Joe Camel, a similar percentage to those who recognized Mickey Mouse. In addition, thanks to the Joe Camel campaign, Camel’s share in the illegal market of minors increased dramatically in the late 1980s and early 1990s from 0.5 percent to 32.8 percent, worth more of \$400 million per year. Lawsuits were brought against the campaign, and the company finally dropped the character in 1997, although it never admitted that the Joe Camel ads targeted children and underage smokers.

Children and teenagers have constantly been targeted by the industry. Decades before Joe Camel, in the 1960s, the original run of television show *The Flintstones* was sponsored by a cigarette maker and the characters in the cartoon smoked Winstons at the end of each show. Tobacco advertising has always emphasized themes which appeal to youth: sexual attraction, social acceptance, thinness, and independence.

Cigarette companies have been skilful and cynical in avoiding bans on advertising their goods. For example, although cigarette advertising has been banned from American television since the early 1970s, sponsorship of televised sport events became the main strategy to avoid the prohibition to broadcast TV ads. It was estimated that during the 93 minutes of the 1989 Marlboro Grand Prix, the name Marlboro appeared 5,933 times for a total of 46 minutes.

In spite of lawsuits and bans, cigarette producers are still managing to reach a wide range of customers with their messages which market flavor and “coolness.” Yet, advertising has also started to backfire at the industry: two of the actors who played the famous Marlboro Man in the company’s adver-

tising campaign, Wayne McLaren and David McLean, died of lung cancer in the 1990s. Before his death, McLaren asked at a meeting of Philip Morris shareholders that tobacco producers agree to limit their advertising.

## civil forfeiture

BEGINNING IN EARLY 1980s, governments and law enforcement agencies in the United States and abroad placed ever-increasing emphasis on targeting the fruits of organized criminal activity. The culmination of this enforcement approach is the seizure and forfeiture of money and other assets derived from criminal activity.

An underlying tenet of proceeds of crime enforcement as a punitive strategy is that the resulting penalties not only encompass the forfeiture of cash and other assets, but fines and criminal sentences may also ensue. An added benefit of this enforcement approach is that it can remove the financial power base that funds the operations of criminal organizations.

In most countries, asset forfeiture is pursued through the criminal courts. For a conviction, coun-

tries relying on the English common law systems require proof beyond a reasonable doubt, which often translates into a heavy burden for prosecutors, especially in relation to criminal entrepreneurs who have successfully concealed ownership of assets. In response, a select few governments have enacted legislation that provides the state with the tools to undertake civil action against individuals and entities involved in organized criminal activity. This includes civil-forfeiture laws, which provide the government with the power to seize property through civil, rather than criminal courts.

Because forfeiture is now pursued through the civil courts, the burden of proof placed on the state is reduced from "beyond a reasonable doubt" to a "balance of probabilities." In other words, governments can confiscate money or assets where only a "reasonable suspicion" may exist that the cash or assets constitute the proceeds of crime. The onus of proof is now shared between the state and the defendant; that is, unlike a criminal trial where there is no obligation by the defendant to prove his innocence, in a civil-forfeiture process the defendant must often prove that the assets in question were derived through legal and legitimate means.

The application of civil sanctions against organized and economic crimes has been most vigorously (and controversially) applied in the United States. The federal Racketeer Influenced Corrupt Organization (RICO) Act makes it unlawful to acquire, operate, or receive income from an enterprise through criminal means. RICO allows the government or a private citizen to file a civil suit requesting the court to order sanctions, or to provide injunctive relief against an individual or organization involved in a "pattern of racketeering." Civil RICO injunctions can, for example, prohibit individuals from owning or becoming involved in certain legitimate or illegitimate businesses or activities.

RICO also allows for the state or private victims to sue civilly to recoup "treble" damages (that is, the defendant must pay to the plaintiff three times the amount of damages that have been determined by a court). A criminal conviction is not a prerequisite for injunctive relief or asset forfeiture under RICO and no person need be charged; the civil asset forfeiture provisions of RICO focuses on property, not people.

The application of civil injunctions, treble damages, and civil asset-forfeiture against criminal organizations and offenders under the RICO statute

have proven successful in the United States in their impact on various organized crime groups. However, many have argued that the law has overstepped its original purpose and has been abused by both justice officials and private citizens. As a result, federal and state officials have taken steps to curtail the far-reaching powers of RICO, including shifting the burden of proof back on to the state and ensuring due process is preserved for defendants.

## class-action lawsuits

A CLASS-ACTION LAWSUIT generally results when someone involved in a lawsuit against a particular company or group realizes that others are involved in similar cases. The major parties in a class-action lawsuit are the plaintiffs, the lawyers, the defendant(s), expert witnesses, and court officials. In class-action lawsuits, lawyers tend to be either idealists who believe in a cause, or ambitious professionals who smell big money. Payment to attorneys may be a percentage of the award or a separate amount established by judges who hear the cases. If a lawyer is dedicated to the case for whatever reason, she may even put up personal funds to finance the early stages of a lawsuit.

Most class-action lawsuits derive from intentional sales of products that can cause harm to users. The goal of the manufacturer is usually to amass huge profits, while the consumer is interested in products that are both safe and effective. In the early stages of a class-action lawsuit, the sides may be unevenly matched because a single lawyer for injured clients may go up against a team of corporate lawyers who represent the manufacturer. As more

people come into the class-action lawsuit, the stakes become higher, and more lawyers may be brought on board.

In order for a lawsuit to be certified as class action, it must be proved that large numbers of plaintiffs have been affected and that the relevant damage occurred under the same circumstances. Once extensive claims have been established, it is assumed that it is more efficient to handle the cases together than to respond to claims that may be scattered among a number of separate jurisdictions or which might result in conflicting judgments. Time may also be a factor for seriously ill claimants, and class-action lawsuits tend to move through the courts more rapidly than do individual cases.

Amendments to the Federal Rules of Civil Procedure in 1966 established three mandatory classes and one voluntary class in class-action lawsuits. The mandatory classes include cases where: 1) separate actions might result in incompatible standards; 2) separate actions might be detrimental to the interests of the claimants; and 3) it is necessary to prevent piecemeal and/or contradictory remedies. Multi-district litigation (MDL) was set up to transfer a large number of geographically separated claimants to a single district. For example, victims or survivors of airplane crashes or hotel fires might be handled through MDL. The first three classes of lawsuits are mandatory and require that individual plaintiffs be bound by resulting judgments. The fourth class is optional, allowing an individual to opt of the class action.

Due to the enormous amount of media attention that has focused on a number of high-profile class-action lawsuits, such as those involving asbestos, Bendectin, the Dalkon Shield, and Agent Orange, consumers and unwitting victims have become more aware that joining forces with other plaintiffs gives a case more impact and increases the chance of proving manufacturer liability. Plaintiffs have also attempted to mandate government and/or manufacturer accountability through class-action lawsuits involving dioxin, nuclear waste disposal, and toxic landfills.

### ASBESTOS

In 1961, the first case charging that exposure to asbestos could cause cancer was filed in Orange, Texas. Claude J. Tomplait who had been an asbestos insulator for some 20 years sought legal help in fil-

ing for worker's compensation. Tomplait had been experiencing severe shortness of breath and "finger chubbing," a thickening of the tissue at the fingertips, for two years and had tentatively been diagnosed with pulmonary dust disease and was unable to work. Both symptoms had previously been associated with exposure to asbestos. In fact, adverse reactions to asbestos could be traced as far back as 1900 when an autopsy was performed after the 10th worker of a 10-man carding room team in an asbestos textile mill died. Within the next few years, settlements in asbestos cases reached up to \$20 million for 445 foam workers in Tyler, Texas and as much as \$3 million in an individual case in Beaumont, Texas.

The U.S. government estimated that at least 11.5 million American workers had been exposed to asbestos. The number of suits over asbestos-related damage against the Manville Corporation, the largest asbestos manufacturer in the world, had grown to such an extent by August 1982 that the company filed for Chapter 11 bankruptcy. Even schoolchildren were not exempt from exposure to asbestos. School-asbestos litigation in 1986 involved a nationwide class-action lawsuit resulting from a number of lawsuits around the country directed toward deciding who was responsible for removing potentially damaging asbestos insulation from public schools.

## BENDECTIN

One of the major class-action lawsuits against a drug company involved the drug doxylamine succinate or Bendectin, which was given to pregnant women experiencing nausea and vomiting. The manufacturer, Merrell-National Laboratories of Cincinnati, Ohio, had identified such adverse side effects as drowsiness, vertigo, nervousness, epigastric pain, headaches, palpitations, diarrhea, disorientation, and irritability. The drug was removed from the market in 1983 as a result of class-action lawsuits claiming that Bendectin caused birth defects. For example, a Florida woman who reported that her son was born with a sunken chest and hand deformation was awarded \$20,000 for medical expenses.

As the lawsuits progressed, lawyers for the manufacturer pursued an aggressive and successful strategy of attacking medical experts and convincing the courts of the company's innocence. By December

1997, the case against Merrell was virtually over, and most claimants had failed to prove Bendectin had been responsible for birth defects.

## DALKON SHIELD

In 1972, the first suit was filed in response to injuries suffered by wearers of the Dalkon Shield, an intrauterine device (IUD) manufactured by A. H. Robins. By 1985, over 14,000 lawsuits had been filed by American women who had worn the birth-control device. In August 1985, a team of four attorneys in Minnesota, representing around 2,000 plaintiffs, filed a class-action lawsuit on behalf of all Dalkon Shield claimants. Millions of Dalkon Shields had also been distributed across 80 other countries, many to women in developing countries with inadequate access to medical services. A. H. Robins, as might have been expected, filed for bankruptcy. Evidence presented in the course of the Dalkon Shield suits revealed that Robins had knowingly sold the IUDs despite evidence that the copper in the product could cause damage, and that their own tests had indicated a potentially dangerous problem with "wicking" in the string attached to the shield. Damages suffered by the women included maternal and fetal deaths, birth defects, "spontaneous abortions," infertility, and a host of lesser complaints. The final settlement against Robins and Aetna (Robins's insurance company) involved \$2.375 billion to be paid in installments.

## AGENT ORANGE (DIOXIN)

Defendants in class-action lawsuits are not always manufacturers. Charges were leveled against the U.S. government, as well as against the manufacturers of dioxin, in the Agent Orange class-action lawsuit where the legality of the issues became interwoven with political and scientific arguments. Veterans developed flu-like symptoms, rashes, joint pain, headache, and other such feelings of general malaise. In more serious cases, it was assumed that cancer and birth defects among babies born to Vietnam and Gulf War veterans were connected to exposure to Agent Orange.

Initially, judges in the United States concluded that scientific and medical evidence linking Agent Orange to the symptoms experienced by veterans was unclear and legally invalid. Affected veterans claimed that the government was responsible for

medical care and compensation and also wanted to hold the manufacturer accountable. Plaintiffs argued that damage caused by exposure to Agent Orange had been identified as far back as the 1970s. For example, Paul Reutershan, a helicopter pilot who had transported supplies through clouds of herbicides, had contracted cancer of the colon and liver. He sued Dow Chemical. In May 1984, Vietnam veterans agreed to a settlement offered by lawyers of seven chemical companies.

While lawyers for the veterans had put up \$750,000 of their own money to pursue the case, the judge limited the total legal fees to under \$10 million. The total settlement for the veterans was approximately \$180 million to be divided among 10,000 current plaintiffs and others who joined the suit within the next year. By 1985, the number of plaintiffs involved in the suit had swelled to 200,000, including affected veterans and widows and orphans of those who had died. The Agent Orange Class Assistance Fund was established to provide counseling and services to veterans and survivors not eligible for cash awards.

Charges were also made from 1991 to 1996 that the federal government had knowingly exposed military personnel in the Gulf War to radiation. Although the government insisted it was innocent and claimed that the symptoms were related to stress, evidence released in 1996 revealed that up to 20,000 troops had indeed been exposed to Agent Orange when army engineers detonated munitions bunkers

*Vietnam War veterans have filed class-action lawsuits over being exposed to Agent Orange, used to defoliate jungles.*

stored in Khamisiyah in Iraq. Subsequent reports suggested that the fallout from the explosions could have affected hundreds of thousands of troops located in the surrounding area. Both the Department of Defense (DOD) and the Central Intelligence Agency (CIA) admitted that they had been aware of the presence of chemical weapons in the Iraqi location for several years.

## SEXUAL HARASSMENT

Class-action lawsuits may also include only a small number of people and have nothing to do with product liability. In 1975, the Forbes Fairlaine Plant, owned by the Evalth Mines, hired a small number of female workers to work in the previously all-male plant. Over the next few years, the female workers were subjected to an intense campaign of sexual harassment, and male supervisors turned a blind eye to the behavior. Additionally, the women were passed over for promotions. In 1988, Louise Jensen, Patricia Kosmach, and Kathleen O'Brien Anderson filed suit against Evalth for alleged sexual harassment and sexual discrimination. All three women suffered from either severe medical or stress-related illnesses. The case, certified as a class-action lawsuit four months later, included all female employees who had worked for Evalth Mines since 1983. In 1986, the Supreme Court decision in *Meritor Savings Bank v. Vinson*, held that employers were responsible for providing a nonhostile working environment.

During the Evalth trial, the court refused to provide an injunction to ban the behavior in question, so the harassment accelerated during this period. During the course of depositions and testimony, it became clear that male employees of Evalth had engaged in a concentrated campaign of sexual harassment that included derisive remarks, inappropriate physical contact, and sexually explicit graffiti and jokes. The landmark decision, which found Evalth liable, received nationwide coverage. The eventual settlement provided \$3.5 million in damages for the 15 women included in the suit.

## Clayton Antitrust Act

PASSED BY THE U.S. CONGRESS in 1914, the Clayton Antitrust Act supplemented and strengthened the Sherman Antitrust Act of 1890. Addressing specific anti-competition practices and problems within the Sherman Act, the Clayton Act's clarifications allowed the federal government to better deal with companies which had monopolies over certain U.S. industries.

The Sherman Act's powers were utilized heavily during the presidencies of Theodore Roosevelt and William Taft in the early 1900s. The act prohibited any action by private firms that would avoid or prevent the natural regulatory action of the U.S. market system. It worked to encourage a healthy and decentralized market structure based upon industry rivalries and competition.

Authorized by the Sherman Antitrust Act in order to maintain competition, the U.S. attorney general is permitted to bring lawsuits against companies that have monopolistic characteristics and attempt to dominate the market in a non-competitive manner. Other companies or parties can bring suit against monopolistic companies as well, and may receive compensation from violators of the Sherman Act. However, the Sherman Act had proved to be relatively unsuccessful in preventing large com-

panies from dominating their industries, especially after the Roosevelt and Taft presidential terms. Vague language plagued the Sherman Act, allowing lawyers for the powerful companies to find a number of loopholes in the legislation. Consequently, the Act's language could be interpreted in different ways.

For example, lengthy disputes revolved around the interpretation of the differences between monopolizing, which was banned by the Sherman Act, and the existence of a monopoly, which is not banned explicitly in the act. As a result, these companies were still able to enter into restrictive business agreements that were not outlawed by legislation or precedent, continuing to create massive concentrations of wealth. The companies' massive treasuries allowed them to dominate their industries, to buy out other smaller companies, and to have the resources necessary to fight the federal government and its antitrust legislation.

### IMPROVING THE SHERMAN ACT

Originally drafted by U.S. Representative Henry De Lamar Clayton from Alabama, the Clayton Act was passed by the U.S. Congress to ameliorate the problems caused by the ineffective Sherman Act. Attacking specific business practices which were highly conducive to the establishment of a monopoly, the Clayton Act had extensive definitions and clearer language when dealing with different actions by private firms.

Outlawed actions include the formation of a trust between two companies with a combined board of directors and access to more than \$1 million in capital, price-fixing agreements with another company that is offering a competing product, agreements that result in an ability to control supply of resources or products which leads to higher prices, and the use of power in a particular industry in order to gain or maintain a monopoly. These specifics prevented companies from price-cutting only in certain areas to attack competition that cannot match the price cut, and from merging to combine market share in a monopolizing fashion.

Labor unions and agricultural cooperatives were excluded from antitrust action by the Clayton Act, trying to deter large companies from exploiting their workforce. Also, the act attempted to restrict the use of federal injunctions against striking laborers, promoting peaceful strikes, picketing, and

boycotting. Labor unions were initially hopeful about the act, but following later judicial decisions, precedents damaged the act's labor provisions.

The Clayton Act's provisions were utilized often in lawsuits brought against large companies. Soon after the passage of the Clayton Act, the U.S. Congress enacted the Federal Trade Commission Act of 1914, creating the Federal Trade Commission (FTC) to enforce antitrust legislation, among other tasks. In 1920, federal prosecutors from the FTC failed to use the Sherman Act and the Clayton Act effectively and the famous U.S. Steel monopoly case ended in failure.

The Supreme Court ruled that "the law does not make the mere size an offense or the existence of un-exerted power an offense." Similar to the Sherman Act, the Clayton Act was later strengthened by amendments. The Robinson-Patman Act of 1936 further detailed price discrimination and the Celler-Kefauver Act of 1950 prevented mergers by dealing with intercorporate stock holdings.

## Clean Air Act

IN RESPONSE TO GROWING concern for the quality of the environment, the Clean Air Act (CAA), first passed in 1970 and amended substantially in 1990, has grown from its original set of guidelines for states to regulate sources of air pollution to specific air-quality requirements and regulatory programs.

Authorized by the CAA of 1970, the Environmental Protection Agency (EPA) established the National Ambient Air Quality Standards (NAAQS), which was the traditional centerpiece of CAA regu-

lations. The NAAQS addresses six pollutants that threaten public health and welfare: sulfur dioxide, nitrogen oxides, particulate matter, carbon monoxide, ozone, and lead. All states and cities and towns in the United States must have levels of these pollutants beneath the ceilings required by the NAAQS or face substantial "nonattainment" fines and penalties.

The CAA authorized the establishment of New Source Performance Standards (NSPS), which regulates the amount of permissible emissions from different classes of facilities. The NSPS requirements are set at levels that are attainable by using programs and systems of emissions reduction, while taking cost for businesses into consideration. However, the NSPS' primary concerns are air quality, environmental impact, and energy requirements, not cost.

The National Emissions Standards for Hazardous Air Pollutants (NESHAP) is another major component of the CAA. It was created to detail and regulate pollutants that may result, or are anticipated to result, in a decrease in public health. So far, this list of potentially harmful air pollutants contains 189 hazardous substances. The 1990 CAA amendments required the EPA to set standard, permissible ceilings for the substances. The implementation of risk-management programs at businesses for dealing with potential releases of hazardous substances is also one of the new requirements of the 1990 CAA amendments.

The CAA amendments administered a specific system for acid rain, caused by sulfur dioxide emissions, describing a potential reduction of 10 million tons annually. The new system, which is market-based, provides power plants, or other sulfur dioxide producers, with emissions allowances, which may be bought, sold, or traded with other companies. Other similar operating permit programs that regulate various air pollutants have been established, administered by state governments. These permits deal primarily with the construction of new businesses or sources of air pollution.

The CAA amendments also set requirements for the banning of chlorofluorocarbons (CFCs) and halons to stop the depletion of the Earth's ozone layer and to comply with the Montréal Protocol, which set international guidelines to reduce depletion.. Fines may be levied against those individuals or businesses that do not meet CAA standards. The CAA amendments legislated criminal penalties and potential jail time of up to 15 years for those who

knowingly violated CAA standards, along with fines of up to \$250,000 for individuals and \$500,000 for corporations for each violation. Since November 15, 1990, when President George H. W. Bush signed the CAA amendments into law, the CAA has had far-reaching positive effects on public health and the environment.

## Clean Water Act

IN RESPONSE TO increasing public concern for the environment and for the condition of the nation's waters, the U.S. Congress enacted the Federal Water Pollution Control Act Amendments of 1972, revising previous ineffective legislation. Amended once again in 1977, Congress refused to allow continued unregulated discharges of untreated wastewater from municipalities, industries, and business into rivers, lakes, and coastal waters of the United States. The law became more commonly known as the Clean Water Act (CWA), and provided a plan to restore and maintain clean and healthy waters.

The CWA can be broken down into five main elements: minimum standards for waste discharges for each industry, standards for water quality, a permit program with enforceable discharge limits, regulations for specific problems like toxic chemicals and oil spills, and a loan program for the construction and modernization of publicly owned treatment plants.

Since its enactment, the CWA's greatest concern has been control of point-source pollution, which is discharged by sewers and factories. The minimum standards for waste discharges are regulated by the Environmental Protection Agency

(EPA) and the standards result in waters which are better for the overall environment and public health.

The discharge permit program, known as the National Pollutant Discharge System (NPDES), is another way that the CWA regulates point-source pollution. The program requires any wastewater treatment plant to obtain discharge permits and follow EPA guidelines for water treatment.

More than 16,000 wastewater plants are part of the permit program and around 3,000 of those plants, mostly publicly owned, participate in the National Pretreatment Program. Pretreatment, designed to reduce the number of pollutants discharged into the sewer system by non-domestic sources, results in safer plant operation and wastewater and sludge which are able to be reused or recycled.

As a result of the CWA, many municipalities across the U.S. have received federal funds to build and to improve wastewater treatment plants. Revisions to the CWA in 1987 removed the previous construction grant program and replaced it with a streamlined State Water Pollution Control Revolving Fund, which built upon the EPA's relationships with each state.

Since its enactment, the CWA has been amended numerous times in order to deal with specific environmental issues like wetlands protection or Great Lakes water quality. As a result of the EPA's enforcement of the CWA and its strong regulations and revisions, significant strides have been made, leading to improvement of public health and the environment. However, challenges remain to be overcome; problems mostly arising from non-point sources like combined and sanitary sewer overflows, continued water treatment infrastructure improvements, and municipal sewage sludge use and disposal.

## Clinard, Marshall (1911–)

MARSHALL BARRON CLINARD is an emeritus professor of sociology at the University of Wisconsin, Madison. Clinard's early education was at Stanford University, and his doctoral training occurred at the famous Chicago School, officially known as the department of sociology at the University of Chicago, where he received his Ph.D. in sociology in 1941. A highly distinguished scholar in the discipline of sociology and the subfield of criminology, Clinard has held academic positions in several universities, including the university of Iowa and Wisconsin, and Vanderbilt University.

In the course of his long and prominent career, Clinard has authored or co-written more than 10 books, 40 articles, and 25 book chapters. His awards are numerous, and he has been honored by many of the leading academic and professional organizations in sociology, criminology and white-collar crime. These include the Academy of Criminal Justice Sciences, the American Society of Criminology, the American Sociological Association, and the Association of Certified Fraud Examiners. Clinard is known for his research in areas that include the sociology of deviant behavior, corporate crime, as well as gang formation and control.

Clinard was one of the first criminologists to follow Edwin Sutherland's early white-collar crime research. In his 1952 study of black-market offenses during World War II, Clinard examined whether these forms of behavior should be considered white-collar crime. He challenged Sutherland's differential association theory by arguing that the personality characteristics of black-market offenders were equally likely to explain their behaviors. Following the 1952 study, Clinard made significant and longstanding contributions to the study of white-collar and corporate crime through his research with critical theorist Richard Quinney.

Their efforts at resolving ongoing definitional disputes resulted in the widely accepted division of white-collar crime into two distinct forms: corporate crime, which occurs on behalf of a corporation and benefits the corporation, and occupational crime, which is committed by individuals against their employing organizations, and benefits the individual offender.

This typology clearly articulated the appropriate unit of analysis for white-collar crime research: either the corporation, or the individual. As a re-

*Clinard's research into the corporate suites of America revealed companies violate the law with great frequency.*

sult, additional white-collar crime research focused on either corporate crime or occupational crime. This did not solve the definitional debates, but at least added conceptual clarity to the field.

A subsequent research contribution made by Clinard resulted from his collaboration with Peter Cleary Yeager on a study that was published in two forms: 1979's *Illegal Corporate Behavior* and 1980's *Corporate Crime*. In the Sutherland tradition, Clinard and Yeager examined crimes committed by the 477 largest manufacturing corporations and the 105 largest wholesale, retail, and service corporations in the United States in the years 1975 and 1976. In that two-year time frame, these 582 corporations were the target of 1,553 federal cases.

The implications of the study were staggering: due to the fact that the numbers were based only on cases brought against the corporations, they underestimated the true, total amount of corporate crime. To use the authors' terms, the findings were merely "the tip of the iceberg." The results confirmed Sutherland's principal finding: corporations violate the law with great frequency. Nearly a quarter of a century after these studies, the results provide a valuable context for researchers examining corporate crime.

## Clinton, William J. (1946–)

THE PRESIDENCY of Bill Clinton, which presidential history scholars have called “puzzling” and “bizarre,” will go down in American history as unique in a number of ways. Before Clinton took office, it was taken for granted that 20th-century presidents would have served in the military. Not only had Clinton failed to serve in the military, he had actually avoided the draft. Supporters of Republican candidate George H. W. Bush (1924– ) hired airplanes to hover over Clinton campaign rallies displaying banners suggesting that voters should not vote for a “draft dodger.”

While Clinton campaigners were generally aggressive, they neglected to put the Republican accusation in the context of widespread distaste for military duty as the Vietnam War became more and more unpopular. Clinton was also criticized for smoking marijuana as a college student, and few people believed him when he insisted that he had not inhaled.

During the honeymoon period enjoyed by most presidents, Clinton tried to fulfill a campaign promise by ending discrimination against gays in the military. In response to a public outcry and outrage in the military, the president settled for a “don’t-ask-don’t-tell” policy that begged the question.

Scandal haunted the Clinton presidency; yet, he survived Whitewater, Travelgate, Nannygate, Troopergate, the suicide of a close adviser, only to become the second president in history to be impeached by the House of Representatives. Like Andrew Johnson (1808–75), Clinton was not removed from office by the Senate. Unlike Johnson, Clinton retained the approval of many Americans throughout the impeachment process. During this period,

Clinton’s job approval rating hovered at 70 percent. Clinton’s popularity during the impeachment proceedings is even more remarkable when compared with Ronald Reagan’s 40 percent approval rating during the Iran-Contra scandal. Known as the “Comeback Kid,” Clinton was a survivor, and the American people were more interested in the booming economy that had led the country out of recession than in political scandals.

During the Clinton administration, white-collar crime flourished in both the public and private sectors. Attorney General Janet Reno, the first woman to hold that office, was involved in investigating campaign illegalities in both the presidential and vice-presidential campaigns, in addition to investigating Clinton’s involvement in Whitewater and several sex scandals. Reno also went after companies that violated antitrust laws such as Microsoft and put pressure on federal lawmakers to bring an end to securities fraud and insider trading. She effected a major overhaul within the Justice Department, promoting governmental ethics by appointing ethics advisers to serve in the offices of all U.S. attorneys.

### TRAVELGATE

When Hillary Clinton announced plans to fire seven veteran members of the White House travel office, including director Billy Dale, and replace them with a private firm, Republicans called it a scandal and dubbed it “Travelgate.” The Clinton administration was accused of improperly using the Federal Bureau of Investigation (FBI) and the Internal Revenue Service (IRS) to support erroneous charges against the former employees. All seven were later cleared of wrongdoing, but the scandal continued to haunt Hillary Clinton when she ran for Senator from New York in 2000. Independent Counsel Robert Ray announced that the First Lady’s testimony was “factually false,” but determined that he lacked sufficient evidence to ask for an indictment.

### NANNYGATE

The Nannygate scandal occurred when Clinton nominated Zoe Baird as the first female attorney general of the United States. Baird was forced to withdraw from consideration when it became known that she had violated federal law by hiring

illegal immigrants as nannies and paying them off the books. Clinton's second candidate Kimba Wood suffered a similar fate. Clinton then nominated Reno who had never been married and who had no children and so avoided the possibility of other childcare scandals.

## WHITEWATER

While Clinton was governor of Arkansas, he and Hillary invested in a development deal to build a resort on the White River in Arkansas with their friends James and Linda McDougal. The Clintons' part of the deal was financed through a \$20,000 loan from the Union National Bank of Arkansas. James McDougal was the head of the Madison Guaranty Savings and Loan, which collapsed in 1989. Both James and Susan McDougal were convicted of conspiracy and mail fraud and were sent to jail, where James McDougal died in 1998. During the course of the investigation into Madison, federal investigators discovered that the Clintons had been considered equal partners in Whitewater Development despite the fact that the McDougals had put up most of the money and that the Clintons had continued to receive money from the deal even after Madison collapsed. Bill and Hillary Clinton, however, insisted that they lost money on the deal. Republican Kenneth Starr was appointed to investigate the Clintons' connection to Whitewater and spent several years and millions of taxpayer dollars attempting to prove that the Clintons had acted unethically.

## SEX SCANDALS

As a Democratic candidate for president, Clinton had been accused by a supermarket tabloid of having a long-term affair with Gennifer Flowers, a lounge singer from Arkansas. Clinton survived this first sex scandal with his wife's help. The two appeared on national television to publicly answer the charges and prove that their marriage was strong. The Flowers fiasco was followed by what became known as "Troopergate" in which two Arkansas state police officers announced that they had helped Clinton to have a number of affairs while he was governor of Arkansas, and suggested that Hillary Clinton had also had affairs. The troopers later admitted that they had lied and revealed that the scandal had been funded by a right-wing billionaire from

Arkansas. Clinton was then sued by Paula Jones for sexual harassment. Trooper Danny Ferguson who had supposedly set up the liaison between Clinton and Jones insisted that Jones had emerged smiling from the encounter with Clinton. Independent Counsel Starr who was investigating the Whitewater affair added Jones' allegations to his investigation. Even though it was revealed that Jones was encouraged and financed by conservatives interested in bringing down the president, Starr pursued the investigation with gusto. Clinton claimed that as a sitting president, he should not have to face charges, but the conservative-dominated Supreme Court disagreed with him.

Clinton's downfall in the sex scandals proved to be a former White House intern named Monica Lewinsky with whom Clinton had sexual contact, although the President insisted it was "not really sex." Lewinsky admitted that the relationship had been consensual and said she had never planned to make the affair public. Lewinsky had been secretly taped by a conservative "friend" Linda Tripp who was convinced she could use the information to bring down the president. Lewinsky agreed to work with Starr only after becoming a target of his pressure tactics. Lewinsky received a major makeover and became a minor celebrity.

## IMPEACHMENT

After it was revealed that Clinton lied under oath in his Paula Jones testimony, the House of Representative impeached him on charges that he had lied under oath and that he had acted to obstruct justice. Public opinion polls revealed that most Americans believed that Clinton should be punished by some means other than impeachment. During the proceedings, for the first time in American history, a president of the United States talked about his sex life on national television. After surviving the unsuccessful attempt to remove him from office, Clinton returned to the White House jubilant and rejuvenated. On the other hand, the reputations of Republicans and the media suffered a temporary ethical setback of their own.

## ELEVENTH-HOUR PARDONS

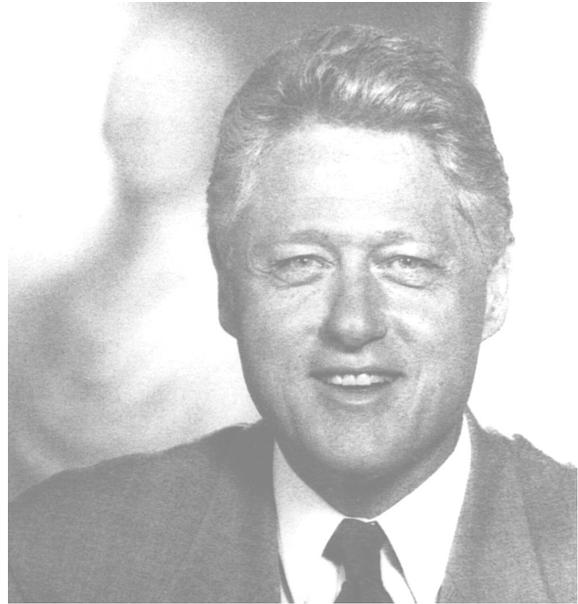

Clinton's final scandal concerned his last minute pardon of 140 individuals only two hours before leaving office. He was particularly criticized by the

far right who accused him of abusing his office by selling pardons. Last-minute presidential pardons are not unusual. However, Clinton's wisdom in issuing the pardons was questionable because he had personal ties to at least three of those whom he pardoned. Clinton's high-profile pardons included Henry Cisneros, the former HUD Secretary who resigned from office after it was discovered that he had lied to the FBI during a background investigation about how much he had paid his mistress, and Patty Hearst, the heiress who had been found guilty of a bank robbery that occurred while she was being held by the Symbionese Liberation Army. The president's half-brother Roger was pardoned for a 1985 drug conviction, and Susan McDougal was pardoned for her part in the Whitewater scandal.

Clinton's approval of a pardon for indicted fugitive financier Marc Rich was very controversial. Rich's involvement with highly suspect business deals brought him to the attention of the U.S. federal government, and in the early 1980s, he was indicted for income tax fraud and breaking a U.S. embargo by selling oil to Iran during the hostage crisis. A criminal indictment was filed against Rich and his partner, Pincus Green, by U.S. Attorney Rudolph Giuliani in 1983. Rich and Green, however, fled the country for Switzerland before the pair could be brought to court to answer the charges. Both Rich and Green remained on the Most Wanted list of the Justice Department for 18 years.

That is, until January 20, 2001. A few hours before leaving office, Clinton fully pardoned Rich and Green, thereby nullifying the indictment against them. The presidential pardon was controversial because Rich had a long history of questionable transactions with third world nations and because Denise Rich, Rich's ex-wife, had lobbied hard for the pardon. The lobbying effort included donations of \$70,000 to Hillary Clinton's Senate campaign, several hundred thousand dollars to the Democratic Party, and \$450,000 to Clinton's presidential library. Clinton denied any connection between the lavish contributions and his decision to pardon Rich and Green. The U.S. Senate Judiciary Committee held hearings to review the legality of the pardon in February 14, 2001 but the results were inconclusive.

While Clinton's job approval ratings continued to be high during most of his presidency, most Americans, whether they were Republicans or De-

*Bill Clinton's legacy as president includes a vibrant economy but also perjury and impeachment.*

mocrats, were appalled by his personal morals and his lack of judgment in giving his enemies the ammunition they needed to begin impeachment proceedings. After leaving office, the former president took a back seat to his wife, a newly elected New York Senator.

## coal mining

COAL MINING companies have a long history of crimes against employees, and the state and federal government, that dates to the 19th century. Crimes against employees included illegal cheating in coal weights, excessive hours, the company towns’ gouging and scrip, unsafe working conditions, and government-assisted violence. Crimes against the United States came later and included violations of labor laws, safety laws, and environmental laws.

The coal regions in the 19th century tended to be remote, tied to the market by the railroads that were the prime consumers of coal. As the United States industrialized between 1880 and 1930, the mining companies entered regions occupied by self-sufficient farmers and enticed the farmers to the mines and the company towns.

Companies built towns, including churches, services, and shops for their mine employees. Miners could rent as long as they were employed, but if they were on strike or otherwise off the payroll they could expect eviction with a 5-day notice. The miners received at least part of their pay in scrip redeemable at the company store. Miners complained about unsanitary conditions, restrictions on their lives, and higher prices in the company stores. Miners sometimes had no right to bring non-employees into company housing, and companies could ban independent stores and peddlers. Company police patrolled the towns and the roads. Company towns largely disappeared by the 1920s.

Companies neglected safety in the mines and cheated on coal weights. Companies influenced state governments to allow convict labor in the mines, even to the point of creating mines within the prison system. Convicts were a controlled labor source that allowed owners to depress wages, repress unions, and break strikes. Sympathetic judges commonly issued injunctions against organized

labor, and the owners influenced state governments to call out the militia to crush unionist disturbances. Companies spied on workers and established their own armies. The Pinkerton agency was the most prominent of the company armed forces. Baldwin-Felts guards enforced owners’ law in West Virginia, Kentucky, and Colorado early in the 20th century.

In one state, West Virginia, absentee ownership became the rule after the Civil War as outsiders bought control of timber, coal, oil, and gas rights. They spent money, they brought jobs, and they created a political system that looked out for their interests. The cost was the people’s life and limb, education, and dilapidated infrastructure because of the inadequate tax base and inadequate enforcement of tax collection. Between 1883 and 1969, 21,311 miners died on the job in West Virginia. When the miners asserted their rights, the companies fought back. Even after the 1930s, when the New Deal labor laws gave legal backing to the United Mine Workers union, the companies maintained their stranglehold over coal country.

## REFORM

When West Virginia Governor William Marland proposed in 1953 to tax extractive industries for the benefit of schools and roads, he failed due to the influence of coal lobbies in the legislature. Governors had attempted to enact severance taxes in 1902 and 1914. Not until the 1970s did West Virginia pass the tax, a sales tax of 5 percent or less, depending on source of coal. The thin seam coal for which mountaintops were removed was taxed at only 1–2 percent. The money didn’t find its way to economic development.

Abandoned coal mines create many problems. Run off and sedimentation contaminate municipal water supplies far from the mine sties. Acidic drainage damages roads and other infrastructure. And mine sites were attractive play sites for children, killing 11 children in one Oklahoma county alone. The Surface Mining Control and Reclamation Act of 1977 (SMCRA), established the first federal regulation of mining. By then, U.S. coal operators had left 1.1 million acres of abandoned coal mine sites. SMCRA funds can clean up only 40 percent of the abandoned mines.

In 1991, U.S. Secretary of Labor Lynn Martin reported that over one-third of the mines in the

United States submitted tampered-with dust samples, commonly vacuumed monitoring cassettes. The department fined 500 operators of 785 mines more than \$6.5 million. The purpose of the testing was to reduce the incidence of black lung disease. Because the companies argued that the results could have been the result of careless handling, there was no prosecution. In 1998, the *Louisville Courier-Journal* documented that the 1997 records showed 80 percent of the country's underground mines were impossibly clean. One method was to turn off the dust pumps so nothing collected in the sampling cassette.

## ENVIRONMENTAL DISASTER

Mining meant stripping away mountaintops. The objections to blasting mountaintops into the valleys and streams were aesthetic, of course, but there were legal objections to the practice in Virginia, Kentucky, West Virginia, and Tennessee. Neighbors were plagued with continual blasting, debris and dust, and overloaded coal trucks rumbling down deteriorating roads and streets. Displacement under duress commonly destroyed entire communities and their long histories. Strip mining of mountaintops destroyed streams and wildlife habitat and the water supplies of residents and the quality of their life. In West Virginia, the mining industry buried 1,000 miles of streams and eliminated 300,000 acres of hardwood forests. Mines were as large as 10 square miles, dumping hundreds of millions of waste into the valleys.

SMCRA authorized the mining if the operators met standards intended to safeguard the public and the environment. Some mining analysts say enforcement has been lax to nonexistent as state and federal regulators ignore company violations. The federal coal statute requires companies to show they won't damage a stream or they're prohibited from mining within 100 feet of it. And the Clean Water Act bars dumping of waste into streams. A court ruling of October 1999 in federal court did affirm that burying streams in the manner practiced by the coal companies was a violation of both coal law and the Clean Water Act.

In 2002, the George W. Bush administration decided to change the law rather than enforce the old one. The changed law requires reclamation unless the operators can show industrial or commercial development will occur on the new plateau. The

states interpret the requirement loosely, and they allow cutting of corners that renders even "reclaimed" lands useless. Blasting damage was prohibited by law. Companies routinely damaged homes, water, and public safety while regulators turned away.

Since after World War II, coal trucks have been growing larger, able to carry more weight than the roads were built to withstand. Coal companies subcontracted coal hauling. Trucking companies, not coal companies, violated the laws, and damaged the roads. As local residents, the truckers faced sympathetic juries. Late in the 20th century, the average violation was more than 42,000 pounds over weight. And the fatality rate in Kentucky's coal country was twice the average because excess weight affected braking and other handling capabilities.

In 1972, Buffalo Creek, West Virginia, flooded as a coal impoundment dam gave way: 125 people died, 500 homes were destroyed, the case drew publicity and litigation as the companies claimed their negligence was an act of God. Such spills were periodic and the National Research Council, a part of the National Academies, which included the National Academy of Sciences, appeared to be weighted toward the companies.

In October 2000, in Kentucky, the A.T. Massey Coal company subsidiary's 72-acre coal waste dam leaked, releasing 250 million gallons of coal slurry through abandoned underground mines into tributaries of the Big Sandy River, which runs to the Ohio. The case raised questions about the adequacy of inspection and enforcement.

John Braithwaite, in 1985, reported that an examination of 39 coal disasters found that they historically have occurred more as a result of company negligence rather than natural forces or human error. The recommended solution was punishment and education about how to reduce injuries, civil and criminal penalties, sanctions, procedural safeguards, and oversight of the offending companies to match the severity of the violation. Liability by both corporation and individuals would make for greater caution.

## Coffee, John C., Jr. (1944–)

JOHN COFFEE, a professor at Columbia University Law School specializing in corporations and white-collar crime, is one of the field's foremost experts. Coffee was recognized by the *National Law Journal* as one of the "100 Most Influential Lawyers in the United States." Before joining the faculty at Columbia, Coffee was on faculty at Georgetown University Law Center and before that with the law firm of Cravath Swaine & Moore. He received a Bachelor's degree from Amherst College and law degrees from Yale Law School and New York University.

Coffee's articles have focused on the role of criminal and civil law in the punishment of white-collar crime. He notes that the line between civil and criminal law has disappeared. The blurring of the line between criminal and civil law will result in injustice and ultimately weaken the social control resulting from criminal law. Coffee explains the real difference between civil and criminal systems is the criminal system's operation of moral education and socialization. People obey the criminal laws because they perceive it as legitimate. Criminal law communicates a set of values, while the civil law balances the public versus private rights. The only time this distinction can be made and communicated is at sentencing. Coffee characterizes the civil system as "pricing," while he characterizes the criminal system as "prohibiting."

Coffee acknowledges the point made by legal scholars warning of "over-criminalization." Propo-

nents of over-criminalization argue that over-reliance on criminal sanctions, particularly with respect to behavior that is not morally culpable, will weaken the criminal system. In particular, proponents of over-criminalization decry the use of criminal sanctions when there is no fraud or there is no victim. In these cases, proponents of over-criminalization argue that crimes that lack fraud or crimes without a victim should be subject to civil court.

## BORDERLINE CASES

Coffee asserts that some cases fall on the borderline between pricing and prohibiting. One such area is corporate criminal liability. In the United States, corporate criminal liability is a form of vicarious liability, which is where the principal can be held liable for the actions of the agent even if the principal takes action to prevent the illegality.

In corporate criminal liability cases, Coffee argues the criminal court is moving into pricing, rather than prohibiting. In these white-collar crime cases, often the judge is making decisions on a case-by-case basis using standards vaguely defined in statute. Coffee asserts that courts should distinguish between cases where senior management directed the criminal activity, and in which case the court should use criminal "prohibitive" penalties. In cases, where senior management was not directly involved, the court should use the civil "pricing" penalty.

## Cohen, Albert K. (1915–)

ALBERT COHEN is a criminologist who studied delinquent gangs and the subculture of working-class boys. In 1955, he published *Delinquent Boys: The Culture of the Gang*. In this influential book, he argued that the norms and values of a delinquent subculture encourage and condone delinquent behavior.

Criminal behavior, according to Cohen, was not acceptable to the dominant culture. The delinquent subcultures that arose in poor, urban environments were rooted in class differences, parental aspirations, and the quality of schools. Groups of boys, frustrated with their apparently low position in society, would begin to act in ways that were rewarded by their own peer group. Crime or gang participation was a rebellion against middle-class standards. Through a process known as reaction formation, those who became delinquent could achieve status by seeing who could reject middle-class values the most.

Cohen asserted that the position of one's family in the social structure was a determining factor in the problems a child would later face in life. Although not all working-class boys became criminals, deviant behavior was a response to social conditions. Cohen stated that delinquent boys acted randomly, according to impulse, and that their misbehavior was a way to achieve peer approval. Thus, the delinquent subculture stemmed from lower-class boys banding together to define their own status. Their behavior was "non-utilitarian, malicious and negativistic," Cohen explained.

Cohen was a student of renowned criminologists Edwin Sutherland and Robert K. Merton. Cohen's delinquent subculture theory combined Sutherland's differential association theory with Merton's strain theory and culture conflict theory. In the 1950s, the public was concerned about juvenile delinquency, and middle-class values were being widely dispersed. Cohen attempted to find the origins of delinquent behavior among lower-class boys and teenage gang members who defied the middle-class goals. Cohen explained how these criminal subcultures had come to "flourish most conspicuously in the 'delinquency neighborhoods' of our larger American cities."

Cohen's work has been both supported and refuted. In *Delinquent Boys*, he asserted that "the delinquent subculture was mostly to be found in

the working class." However, he did not offer an explanation for the prevalence of white-collar crime. He also neglected to elaborate on why some formerly delinquent boys later became law-abiding. Many scholars and researchers in the criminology field have explored and tested his notion of the relationship between status deprivation and delinquency.

## Coleman, James W. (1947–)

JAMES WILLIAM Coleman in 2003 was a professor of sociology at California Polytechnic State University, San Louis Obispo. Coleman received his Ph.D. in sociology from the University of California, Santa Barbara, in 1975 and is a widely respected scholar in several distinct areas of research. These include the sociology of white-collar crime, the sociology of social problems, and the sociology of drug use. Other research areas investigated by Coleman include social foundations of Western Buddhism as well as the world system's political economy. His research on white-collar crime has been published in prestigious academic journals such as the *American Journal of Sociology* and *Social Problems*.

He is probably most well known as the author of *The Criminal Elite: The Sociology of White-Collar Crime*, a book that is in its fourth edition. Additionally, Coleman's work has appeared in edited books on white-collar crime, including Kip Schlegel and David Weisburd's *White-Collar Crime Reconsidered* and Neal Shover and John Paul Wright's *Crimes of Privilege: Readings in White-Collar Crime*. Coleman has been invited to present his research at numer-

ous national meetings, including Indiana University's 1990 Sutherland Conference on White-Collar Crime, where he reviewed the field's theories of white-collar crime beginning with Sutherland until the 1990s. Coleman's own theory of white-collar crime was initially developed in a 1987 article, "Toward an Integrated Theory of White-Collar Crime." In this seminal article, he argues that both wealth and success are common human goals. In the world of business, these factors contribute to a belief system referred to by Coleman as the culture of competition. Coleman's theory specifies that the culture of competition interacts with the motivations of individual offenders and subsequently results in the acts of white-collar crime.

To better understand white-collar crime and therefore prevent it, Coleman suggests that researchers focus on larger, macro-level factors such as capitalism, as well as factors unique to specific organizational settings, including various subcultures that may develop among employees. Most importantly, Coleman is an advocate for including micro- (pertaining to individuals) and macro- (pertaining to organizations) level factors for a more complete understanding of white-collar crime.

## commodities fraud

COMMODITIES FRAUD refers to certain illegal activities involving futures contracts traded in the United States on organized exchanges such as the Chicago Board of Trade, the Chicago Mercantile Exchange, the New York Futures Exchange, the MidAmerica Commodity Exchange, and the Kansas City Board of Trade. Commodities fraud pertains

to exchange members who fail to register with the exchange, perform transactions with no economic purpose other than to generate profit for the member of the exchange, provide false or misleading information to customers or steal customer funds.

Futures contracts are legally enforceable contracts, or agreements, where one party agrees to pay a certain price for a specified quantity of corn, soybeans, wheat, oil, petroleum, natural gas, or other commodity to be delivered on a specified date. Today, futures contracts have expanded beyond traditional commodities into financial instruments, and into such things as the weather.

### EARLY FUTURES TRADING

Futures trading is not a recent development, it can be traced to Europe in the 18th century. The immediate predecessor was the "to-arrive" contract. This was simply a contract for the purchase of goods upon their arrival. For example, ship cargoes were often sold before their arrival in port on a "to arrive" basis.

The to-arrive contract also filled an important need in the grain trade in the United States, which had expanded rapidly during the 19th century. Grain prices, during the early stages of American development, were subject to a seemingly endless cycle of boom and bust. At the end of the crop year, farmers would flood the market with grain, and prices would drop drastically. Grain would then be left to rot, or simply be dumped, as prices became so low that transporting it to market became a losing proposition. Later in the crop year, shortages would develop and prices would rise as dramatically as they had fallen.

Consequently, buyers and sellers sought to provide for their needs by contracting for the delivery of quantities and grades of grain at an agreed-upon price and delivery date in the future, depending on when the grain would be needed and when it was available. This was accomplished through to-arrive or forward contracts. Soon, a practice developed whereby these to-arrive contracts were themselves bought and sold in anticipation of changes in market prices.

Just as futures contracts are nothing new, neither is fraud new to commodity markets. In the 1880s, "bucket shops," an early form of commodity fraud appeared. A bucket shop is an establishment where bets can be made on current prices for com-

modities. The bets are not executed as contracts on any exchange, but rather are placed on the bucket shop's books, just as would be done by a bookie, who offsets his bets by his own resources. Such resources were often sadly lacking, as discovered by successful wagers when they came to collect their winnings.

The Chicago Board of Trade sought to stop the bucket shops by cutting off access to its market quotations, upon which the bucket shop operations were wholly dependent for their operations. Nevertheless, the bucket shops continued to thrive due to competition from other exchanges which provided the bucket shops with market quotations. States attempted to pass legislation regulating bucket shops. By 1922, it was clear that neither the self-regulatory approach of the exchanges through their rules or state laws would eliminate or even curtail the fraudulent bucket shops. Therefore, in 1922, Congress enacted the Grain Futures Act, and in 1936 Congress passed further legislation to prevent manipulation and fraud in the futures market.

In 1974, Congress transferred authority for regulating the futures market from the Department of Agriculture to a newly created independent agency, The Commodity Futures Trading Commission (CFTC). The CFTC continued the regulation of futures exchanges through self-regulation with federal oversight. The CFTC created a division of enforcement to sanction exchange members who engaged in deceptive or fraudulent activities.

#### THE CFTC AND FRAUD

The CFTC's first non-option related fraud case involved the American International Trading Company (AITC), a Los Angeles-based company headed by Harold Berman. The company offered a managed-account program for trading in commodity futures contracts and required an investment of as little as \$2,000.

AITC promised profits to speculators and guaranteed customers that they would not lose more than they invested, that is, customers would not be subject to margin calls. The program was widely advertised in Los Angeles. Berman even conducted television shows on a Los Angeles financial broadcast station, where one of his guest stars was Jack Savage, who acted as an adviser to AITC.

The CFTC charged that Savage and Berman operated a scheme to cheat and defraud AITC cus-

tomers. One way this was carried out was by wash sales. Berman entered opposite buy and sell orders for AITC customers that had no effect except to generate commissions for AITC. In addition, it was charged that Berman and Savage entered into pre-arranged trades for customers on the floor of the MidAmerica Exchange in a manner that allowed Savage to make large profits to the detriment of AITC customers. AITC was additionally charged with entering into a series of "Robin Hood" transactions where profitable sides of offsetting trades were allocated to customers whose equity had declined below zero, requiring AITC to meet their margin calls. The nonprofitable sides of those trades were placed in the accounts of AITC customers with positive equity balances. This trading effectively transferred funds from customers with positive equity balances to customers with negative balances.

#### RELIEF AND SANCTIONS

The CFTC obtained injunctive relief and administrative sanction against AITC, Berman Savage, and others. AITC was closed down and a civil penalty of \$250,000 was imposed by consent, although it was never collected. Savage appealed the injunction obtained by the CFTC. Although he was successful in some issues, the injunction was affirmed in other respects.

Another early case of fraud involved the Citadel Trading Company of St. Louis and Steward Fason, the author of a book entitled *A License to Steal*. The book depicted the asserted trading successes of its author in the futures market, where he purportedly had made over \$1 million. Fason promoted his book by offering to trade the funds of persons attending seminars he gave and by extolling his trading methods. In making that offer, Fason advised prospective investors that he would retain 20 percent of their net profit as the sole compensation for his successful trading of their accounts. He would waive that fee for six months for persons who allowed him to trade their accounts and would then give him an affidavit certifying his trading success. Fason claimed that he wanted to use these affidavits to promote his book.

Fason placed the funds of a large number of customers who responded to the offer with the Citadel Trading Company. There, the funds were traded in wash sales and other transactions designed

simply to generate commissions that were secretly shared with Fason through deposits in an account he controlled.

That account was designated as the "ALTS" account. It was also discovered that Citadel was using customer funds to pay for an automobile, an apartment, and other personal expenses. Administrative sanctions were entered against Citadel and Fason. A floor broker handling the Citadel wash sales was also barred from registration as a floor broker for a period of five years.

### UNAUTHORIZED TRADING

Other significant fraud cases involved charges of unauthorized trading. For example, in a case brought against Jeffrey Silverman, the respondent had entered unauthorized commodity futures trades for eggs and pork bellies, and continued to do so even after at least one customer objected. The Seventh Circuit court upheld the CFTC's order, prohibiting Silverman from trading futures contracts on U.S. exchanges for a period of two years.

Similarly, in a case against Robert Haltmier, the account executive was sanctioned for entering several unauthorized transactions for a customer who was traveling abroad. The CFTC's action was upheld by the Second Circuit, but the court criticized the CFTC for prohibiting Haltmier from trading on U.S. exchanges. The Second Circuit pointed out that Haltmier's conduct involved the illegal trading of customer accounts, for which he should have been sanctioned, and not his own personal trading, to which the prohibition applied.

A more sophisticated illegal form of unauthorized transactions arose involving Winchester-Hardin-Oppenheimer Trading Company. There, it was charged that respondents had engaged in a fraudulent scheme to allocate profitable transactions to a nominee account of a respondent and losing trades to customer accounts.

The Division of Enforcement has also brought numerous registration denial and revocation cases. Applicants were denied registration for bank robbery, false statements in a CFTC registration application, petty larceny, felony tax violations, a conviction for false statements to the Department of Housing and Urban Development, acting without required registration, federal securities law violations, and failure to disclose to the CFTC prior part-time employment as a real estate salesman.

On the other hand, a convicted counterfeiter was allowed to register. In the much publicized registration case against Larry Williams, the Division sought to deny Williams registration as a commodity-trading adviser on the grounds that he had previously been sanctioned by the Securities and Exchange Commission (SEC) on the basis of a consent settlement and that he had misleadingly promoted his futures trading system and his book on futures trading, entitled *How I Made \$1,000,000 Trading Commodities Last Year*. Williams had promoted his futures system through seminars for which he charged \$1,500 per participant and offered gains of 100 percent. Over 500 people attended these seminars.

The case against Williams suffered several weaknesses. The SEC had reinstated Williams' registration as an investment adviser, undercutting the suggestion that his prior securities activities were evidence of his continuing unfitness to deal with the public. The division's claim that Williams had misrepresented his trading successes in his book were also nebulous. The division asserted that, while he had made \$1 million trading, not all of that profit was for his own account. But this was not found to be misleading, since customers were concerned about trading results, not who benefited. A CFTC administrative law judge did find that Williams had been at least negligent with respect to misleading statements in announcements promoting his seminars because he portrayed his trading system as perfect, when, in fact, it had serious flaws. The CFTC, however, concluded that because the conduct occurred before the creation of the CFTC, it would not be used to disqualify him from registration.

A continuing problem for the Division of Enforcement has been abuses by commodity pools and their advisers. The large amount of liquid funds that may be obtained from the public for the operation of these pools made them particularly susceptible to abuse. Perhaps the most famous commodity pool case brought by the division (whose efforts were spear-headed by John Cotton) involved Chilcott Portfolio Management Inc., an Oklahoma firm that was the creation of Thomas D. Chilcott, and which was placed in receivership by the CFTC. Chilcott converted (stole) over \$80 million of funds it had solicited from over 400 customers.

More recently, the CFTC has investigated and prosecuted foreign-currency fraud involving futures or options. Currency trading scams often attract

customers through advertisements in local newspapers, radio promotions, or attractive internet sites. These advertisements may boast purportedly high-returns, low-risk investment opportunities, or even highly paid currency-trading employment opportunities. During fiscal year 2002, the CFTC filed 12 enforcement actions against 61 defendant firms and individuals selling illegal foreign-currency futures and option contracts.

The fraudulent activities of these scam artists is increasingly becoming more sophisticated. In some cases, the defendants continuously move their operations to evade the CFTC's jurisdiction by claiming they were dealing with regulated counterparties (some in foreign locations) or that the contracts sold were spot (and not futures) transactions. Commodity fraud will continue to be a problem in the 21st century. As with other financial markets, the increased availability of more sophisticated technology has transformed the structure of the industry and increased the opportunity for fraud.

## Commodity Futures Trading Commission

THE COMMODITY Futures Trading Commission is an independent agency of the federal government created by the Congress in 1974 to regulate commodity futures and option markets in the United States. The CFTC is responsible for ensuring mar-

ket integrity and protecting market participants against manipulation, abusive trading practices, and fraud.

A futures contract is an agreement to buy or sell in the future a specific quantity of a commodity at a specific price. Most futures contracts contemplate that actual delivery of the commodity can take place to fulfill the contract. However, some futures contracts require cash settlement in lieu of delivery, and most contracts are liquidated before the delivery date. An option on a commodity futures contract gives the buyer of the option the right to convert the option into a futures contract. Futures and options must be executed on the floor of a commodity exchange (with very limited exceptions) and through persons and firms who are registered with the CFTC.

Most of the participants in the futures and option market are commercial or institutional users of the commodities they trade. These users, most of whom are hedgers, want the value of their assets to increase and also want to limit, if possible, any loss in value. Hedgers may use the commodity markets to take a position, which will reduce the risk of financial loss in their assets due to a change in price. Other participants are speculators who hope to profit from changes in the price of the futures or option contract.

Futures contracts for agricultural commodities have been traded in the United States for more than 100 years and have been under federal regulation since the 1920s. In the last 20 years, futures trading has expanded rapidly into many new markets, beyond the domain of traditional physical agricultural commodities. Futures and options are now offered on many energy commodities such as crude oil, gasoline, and natural gas, as well as on financial instruments, including foreign currencies, U.S. and foreign government securities, and U.S. and foreign stock indices. In addition, in recent years, new futures contracts have been offered in nontraditional commodity areas such as electricity, seafood, dairy products, crop yields, and weather derivatives.

The CFTC has responsibility to the markets and their users for contract review and market surveillance. To ensure the financial and market integrity of the nation's futures markets, the CFTC reviews the terms and conditions of proposed futures and option contracts. Before an exchange lists a new futures or option contract for trading, it must certify that the contract complies with the requirements of

the Commodity Exchange Act (CEA) and the commission's regulations, including the requirement that the contract terms reflect commercial trading practices and that the contract cannot be readily susceptible to manipulation. The commission conducts daily market surveillance and can, in an emergency, order an exchange to take specific action or to restore orderliness in any futures contract that is being traded.

The CFTC also has responsibility to the markets for regulating futures professionals. Companies and individuals who handle customer funds or give trading advice must apply for registration through the National Futures Association (NFA), a self-regulatory organization approved by the CFTC. The CFTC also seeks to protect customers by requiring registrants to disclose market risks and past performance information to prospective customers, by requiring that customers' funds be kept in accounts separate from those maintained by the firm for its own use, and by requiring customer accounts to be adjusted to reflect the current market value at the close of trading each day. In addition, the CFTC monitors registrant supervision systems, and internal controls and sales-practice compliance programs.

#### COMPLEMENTARY RULES

Commodity exchanges complement federal regulation with rules of their own, rules covering clearance of trades, trade orders and records, position limits, price limits, disciplinary actions, floor-trading practices, and standards of business conduct. A new or amended exchange rule may be implemented upon certification by the exchange that the new or amended rule complies with CEA and commission regulations. The CFTC may also direct an exchange to change its rules or practices if found to be in violation. The NFA performs similar functions for non-exchange member firms. The CFTC also regularly audits each exchange and the NFA's compliance program.

## compliance programs

COMPLIANCE PROGRAMS generally refer to internal policies and procedures that private sector companies must implement to ensure adherence to specific government-imposed laws and regulations. Requiring compliance programs in the private sector is part of a broader government regulatory enforcement strategy. The application of the so-called compliance strategy by governments has increased in recent years to help stem both regulatory and criminal infractions committed by or against private-sector companies. Compliance programs are meant to reinforce a broad fiduciary duty on companies, requiring them to act in the best interest of their clients, stockholders, or society in general. They are also meant to protect the company, by forcing them to enact policies and procedures to protect against fraud, money-laundering, or other crimes.

Compliance strategies derive from the nature of regulatory law which produces a situation in which an organization's main role is seen to be the maintenance of high standards and compliance with regulations. When compared with criminal sanctions, compliance strategies are often pursued by governments as a less punitive method of regulating industries.

Moreover, compliance programs differ from more punitive, (reactive) enforcement approaches in that they are largely proactive: compliance strategies are meant to encourage companies to have policies and programs in place to ensure that unethical behavior, regulatory infractions or criminal behavior does not occur in the first place.

Some experts have criticized this compliance approach, arguing that it can be easily circumvented and treats the perpetrators of white-collar crime (individuals in the upper classes) much too leniently, especially when compared with property crime of-

fenders, which is more often committed by those with lower socioeconomic status.

The Securities and Exchange Commission (SEC) and the Federal Reserve Board (FRB), two of the American government regulators of the private sector, have both increasingly relied on compliance strategies in relation to its regulated entities. In 2003, the SEC proposed new rules that would require investment companies and advisers regulated by the SEC “to adopt and implement policies and procedures reasonably designed to prevent violation of the federal securities laws, review those policies and procedures annually for their adequacy and the effectiveness of their implementation, and appoint a chief compliance officer to be responsible for administering the policies and procedures.” The proposed rules, entitled Compliance Programs of Investment Companies and Investment Advisers, are ultimately designed to protect investors “by being the first step toward enhanced compliance achieved through private initiative.”

The SEC conducts examinations to determine whether its regulated entities are adhering to federal securities laws. They are also meant to “identify compliance problems at an early stage, identify practices that may be harmful to investors, and provide a deterrent to unlawful conduct.” However, like most government regulatory agencies, it is limited in its capacity to examine the thousands of companies that fall under its authority. As such, regulators like the SEC are beginning to require companies to put in place their own internal compliance policies and procedures, including a designated compliance officer as well as measures to audit and test the compliance program. The SEC believes that regulated entities with effective internal compliance programs administered by competent compliance personnel are much less likely to violate the federal securities laws. Moreover:

If violations do occur, they are much less likely to result in harm to investors. In contrast, we have learned to regard weak controls as an indicator that undetected (and uncorrected) violations may have occurred, and we have assumed that, until improved controls are implemented, investors are at risk. Accordingly, our staff focuses its examination efforts on testing the effectiveness of controls and related compliance procedures, and requests that management correct any weaknesses that the staff discovers.

This focus allows us to leverage our limited examination resources; we are able to direct additional resources to firms with weaker compliance controls, and may examine them more closely and more frequently.

As implied above, some government regulators now believe that their examination efforts are better focused on ensuring that companies have compliance programs in place, as opposed to conducting examinations that are meant to directly identify infractions against relevant laws and regulations. One of the principal activities of the FRB, for example, is to ensure its regulated financial institutions have in place policies and procedures that comply with federal anti-money laundering laws. Compliance audits are conducted by hundreds of FRB examiners, who are responsible for reviewing anti-money laundering programs of more than 1,300 financial institutions in the United States. In addition, FRB regulations require that financial institutions provide for independent testing of compliance with federal money laundering laws by bank personnel or an outside party.

In 2004, the most stringent and widespread government-mandated compliance programs center on measures to combat money-laundering and terrorist-financing. In the United States and numerous other countries, financial institutions and numerous other categories of companies other must implement anti-money-laundering (AML) programs in order to be in compliance with federal and state laws.

The legal requirements for anti-money-laundering compliance programs were intensified in the United States through Title III of the USA Patriot Act (International Money Laundering Abatement and Anti-Terrorist Financing Act of 2001), which requires all financial institutions to implement strict procedures and controls for screening client lists and transactions against government lists of suspected terrorists, drug dealers, money launderers, and other criminals. The act also requires certain additional due diligence and record-keeping practices. In order to ensure these measures are in place, Section 352 of the act requires all financial institutions to implement an anti-money-laundering program. Failure to comply can result in penalties of up to \$1 million.

The penalties attached to noncompliance are meant to combine a carrot-and-stick approach to

regulation of private sector companies: compliance programs allow companies to be largely self-regulating, however, failure to act may result in substantial criminal and civil penalties. The strength of a government compliance strategy “lies in its recognition that persuasive strategies and self-regulation can be effective only if backed up by the threat of tough and credible sanctions,” author Hazel Croall explains.

## Comprehensive Thrift Act

ON NOVEMBER 29, 1990, President George H. W. Bush signed the Crime Control Act of 1990 into law. It was a series of acts designed to reduce crime in a variety of ways. One particular provision, Title XXV of the Crime Control Act, which is better known as the Comprehensive Thrift Act and Bank Fraud Prosecution and Taxpayer Recovery Act of 1990, deals with the prevention of financial misconduct by banking institutions.

Proposed by Senator Joe Biden (D-D) and co-sponsored by Senator Strom Thurmond (R-SC), Title XXV of the Crime Control Act greatly improved banking law enforcement to prevent and punish previous financial misconduct through a number of provisions, outlined into nine different subsections. Title XXV increases criminal penalties and allows for imprisonment if a banking official conceals assets from the Federal Deposit Insurance

Corporation (FDIC), obstructs government examination of a financial institution, or commits bank fraud. Prison sentences for banking officials guilty of bank fraud or embezzlement may be as high as a maximum of 30 years.

Also, former felons of certain crimes like perjury or breach of trust are prohibited from working or participating at a financial institution for at least 10 years. Under the legislation, undercapitalized banks, or those banks whose operations are hampered by a lack of capital, are prohibited from making indemnification payments to parties related to the affected cash-strapped institutions. After penalties for misconduct have been assessed, the act directs the U.S. Sentencing Commission to restore properties or money lost through financial violations to related bank crime victims.

Title XXV amends other laws related to financial crimes in order to protect assets from wrongful disposition. The Federal Deposit Insurance Act and the Federal Credit Union Act were amended to provide clearer guidelines for asset attachment procedures. The amendment improves the procedures for dealing with financial misconduct cases and modifies the federal response structure for crimes by financial institutions. Reporting requirements for the attorney general were changed and they specify that the attorney general must compile reports on major criminal investigations related to finance, and present reports that detail the status of each federal judicial district and the actions of the Financial Institutions Unit.

The act establishes the National Commission on Financial Institution Reform, Recovery, and Enforcement to research and reach conclusions concerning the causes of problems within the savings and loan scandals of the 1980s which led to the enactment of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (FIRREA). FIRREA was amended to increase appropriations over the next two financial years (1991–93) to the attorney general, Internal Revenue Service, and the federal court system in order to better prosecute and ameliorate bank crimes.

At first, banking officials were unsure of the eventual implications of the sweeping provisions of the Comprehensive Thrift Act and Bank Fraud Prosecution and Taxpayer Recovery Act of 1990. However, they were able to circumvent certain new regulations by acting as an individual independent of a financial institution. Still, the act provided the

Attorney General and the Federal Deposit Insurance Corporation (FDIC) with more power to take action against banks operating in a fiscally unsound manner and to recover assets which were improperly lost by financial institutions or citizens.

## Computer Fraud and Abuse Act

COMPUTER-RELATED crime grew exponentially throughout the 1990s. Into the 21st century, computer-related crimes have become more and more prevalent and diverse. The primary federal statute used in combating the various types of computer crime is 18 U.S.C. § 1030(a)(1)-(a)(7). Section 1030, is better known as the Computer Fraud and Abuse Act (CFAA).

It was enacted originally in 1986 and has been several times by Congress. The CFAA includes an extremely expansive definition that includes coverage of all “protected” computers from a wide variety of activities of unauthorized access to and/or theft of information from “protected” computers.

A “protected” computer includes any computer “used in interstate or foreign commerce or communication.” In other words, the CFAA allows punishment of all unauthorized access to and/or theft of information, in a variety of manners, government, as well as from private, computers. The original statute only included a “federal interest computer” but this was too limiting given the substantial growth of the internet.

The CFAA is comprised of seven main subsections, (a)(1) through (a)(7), aimed at defining specific computer-related criminal conduct. The first subsection prohibits accessing a computer without authorization or in excess of authorization and using information, which could be used to injure the

United States. The second subsection prohibits obtaining, without authorization or in excess of authorization, information from a financial institution.

The third subsection prohibits intentional, without authorization or in excess of authorization, access of a nonpublic computer of a U.S. department or agency. The fourth subsection prohibits access to a protected computer with the intent to defraud or obtain anything of value. This subsection also requires without authorization or in excess of authority.

The fifth subsection is the primary anti-hacking section of the CFAA. This subsection makes it a crime to intentionally damage a protected computer without authorization through the transmission of a program, information, code or command. This subsection is an amendment to the original statute. Under this subsection, if harm does result from unauthorized access, even if there was no intention of harm, the perpetrator could still be punished by law.

The sixth subsection criminalizes the unauthorized access and trafficking of passwords or similar information where it is done knowingly and with the intent to defraud. The last subsection prohibits the transmission of communication which contains any threat to cause damage to a protected computer and extort or gain anything of value from that transmission.

Given that the CFAA is a federal statute, the Federal Sentencing Guidelines govern sentences. In 1996, Robert Morris, a Cornell University graduate student, was the first person prosecuted under the CFAA. Morris created a worm, a computer virus that infected over 6,000 computers across the United States. He was sentenced to three years probation, fined over \$10,000 and ordered to perform 400 hours of community service. The public was not pleased by the light sentence. In 1997, Congress directed the U.S. Sentencing Commission to provide for a minimum of six months of imprisonment for defendants convicted under sections 1030(a)(4) and (a)(5).

The CFAA provides a tool for the criminal justice system to respond to illegal use of computers, but a central problem remains. The identification of perpetrators and the ability to effectively use the CFAA relies on law enforcement personnel who may not be as familiar with a computer and various software systems and digital files as the potential perpetrator.

## computer hacking

BEGINNING IN THE 1980s, as new technology made what former Vice President Al Gore called the Information Superhighway possible, the world has become smaller and more vulnerable. Any computer that is connected to the internet or to a network opens a line of communication that can be accessed by computer hackers around the world. Computer hackers have been responsible for threats to national security, credit-card and identity theft, software piracy, financial fraud, trade-secrets theft, information theft, denial of service attacks, wanton destruction of data, software, and hardware, and various other malicious behaviors.

It is difficult to estimate the full extent of the damage caused by computer hackers because of under-reporting. Estimates of annual costs have ranged from \$555 million and \$13 billion. When government agencies or businesses are attacked, costs include downtime, lost business opportunities, salaries for staff who spend time repairing damage, and fees for consultants and lawyers. Homeowners who have been maliciously hacked may have to replace a damaged hard drive or even an entire computer.

Originally, the term *hacker* was used to identify anyone who gained entry into another computer without the consent of the owner. The typical hacker was curious about the way that computers worked and how they communicated with each other. This sort of hacker has also been called “benign” or a “white hat.” Some companies have hired these hackers to test their systems and to find and plug holes in operating systems such as Unix or Windows or to protect confidential information

and products. When most people refer to computer hackers, they are referring to what is also known as “crackers” or “black hats.”

Unlike the traditional hacker, the cracker is interested in accessing other computers for malicious or criminal purposes. This individual is generally profiled as a young, male computer genius. He is often characterized as precocious, curious, and persistent. He may be delinquent, hyperactive, or a drug or alcohol abuser. The cracker is also known to lie, cheat, steal, and exaggerate. A network of hackers has developed through online bulletin boards, *2600* magazine, and through other less formal means of communication. Networking allows hackers to communicate with one another, to trade hacking techniques, to identify holes in operating systems and other software, and to brag about their exploits to one another. The more professional hackers who belong to this network are critical of uninitiated hackers who are called “script kiddies” who may download hacking software from the internet rather than calling on their own skills and initiative to engage in computer hacking.

Hackers enter computers for a number of reasons and may come from either inside or outside a company, agency, or network. Inside hacking is generally performed by employees or former employees who illegally or unethically try to access privileged information or attempt to manipulate or destroy information. They may also hack simply out of spite or revenge. Outside hackers may be interested in stealing proprietary information such as user passwords that allow access to entire networks, or in stealing trade secrets or source codes or financial records. Others may be looking for personal information to pave the way for identity theft. Still others may be interested in setting up denial of services attacks that have been known to crash the entire systems of government entities and large corporations, or the hackers might just enjoy snooping or acting maliciously.

### MALICIOUS HACKING

Viruses, worms, and logic bombs have become common tools by which computer hackers create extensive havoc. Viruses are intended to “infect” a computer and can do anything from launch a denial of service attack to e-mailing thousands of recipients. The worm copies itself and exploits weaknesses in the computer system. Although they are

not usually criminal in intent, viruses and worms can be costly. The Melissa worm, created by New Jersey programmer David L. Smith, for example, cost an estimated \$80 million in damages as it spread its havoc through cyberspace. In 2003, the so-called Blaster worms hit hundreds of thousands of computers and spawned a number of variants. Logic bombs create damage by “exploding” at a designated time or when a particular action is performed. From 70,000 to 90,000 viruses and worms were identified in 2003 alone.

Malware, also known as a “Trojan Horse,” is malicious software that is intended to plant a program on a computer, without the owner’s knowledge, that will cause certain outcomes. For example, malware can attach itself to software such as Microsoft Word or Power Point and set a sequence in play that allows the hacker to do things like cause a CD drive to open on its own or to play a music file in the middle of the night. Malware may have a more sinister purpose. For instance, it may install a program that allows the hacker to listen in on conversations around the computer, even if the com-

puter’s microphone is turned off, or it may record a user’s keystrokes to transmit information back to the hacker.

## CRIMINAL HACKING

The first federal prosecution for computer hacking occurred even before access to the internet became commonplace. In 1966, a computer programmer under contract to a Minneapolis, Minnesota, bank experienced what he saw as a temporary shortage of funds. He manipulated his own account so that no overdrafts were reported. He found the fraud so easy that eventually \$14,000 in overdrafts were hidden within a computer program that only he understood. Unfortunately, when the system crashed and accounts were recorded manually, the hacker was caught. A number of criminals now use computers to perform crimes that would have required physically breaking and entering businesses a few decades ago. For example, in 1997, an FBI sting at the San Francisco International Airport netted a criminal who was trying to sell a compact disk with 100,000

*For computer hackers, the click of a mouse that launches a worm or virus can lead to a criminal conviction.*

*Identity theft, credit-card fraud, and plain malfeasance are some of the goals of computer hackers.*

credit card numbers on it for \$260,000. The list had been retrieved by hacking into various computers and was encrypted using the first paragraph on page 128 of Mario Puzo's *The Last Don*.

Kevin Mitnick may be the most notorious computer hacker in the United States. In July 1999, Mitnick pled guilty to one charge of cellular telephone fraud and was sentenced to eight months in jail and banned from using a computer. Mitnick had originally been charged on 23 separate counts of telephone and computer fraud. While serving time in jail, Mitnick became a cult hero. Since he had never faced trial, many Americans believed that Mitnick had been railroaded by overzealous government prosecutors. Mitnick was 17 the first time he was arrested for computer hacking in 1980. He became so adept that he evaded capture by the FBI and other government agencies for two years.

Mitnick was finally captured on February 14, 1995, after he targeted "white hat" Tsutomu Shimomura. Mitnick activities cost businesses close to \$300,000. After being released from prison and regaining the right to use a computer, Mitnick turned his extensive talents to working with business and industry to improve computer security and to prevent other hackers from doing what he had done for years.

In 1988, Clifford Stoll, an astronomer at Lawrence Berkeley Laboratories in California, did what no government agency in the United States had been able to do. Through virtually devoting his life over a period of months to catching a hacker that he dubbed the "Hanover Hacker," Stoll, with a lot of help from his friends, uncovered a spy ring of German youths who were selling government secrets to the KGB in the Soviet Union.

Adrian Lamo called himself a white hat, insisting that he only broke into computer systems to identify weak spots that might be used by black hats to do malicious or criminal damage to the system. The *New York Times*, however, believed that Lamo is a simple crook. According to the Federal Bureau of Investigation (FBI), which arrested Lamo on August 1, 2003, the 22-year-old hacked into the *Times* computer on a regular basis between February and April of the previous year.

He accessed confidential information, costing the newspaper more than \$25,000 to repair damages and an additional \$300,000 that had been billed to the *Times* for time Lamo spent on the service Lexis-Nexis.

Four American teenagers hacked into the Bay Area Internet Service computers and stole credit cards, ordering \$200,000 worth of computers from an online auction. They were apprehended when they picked the computers up at an empty house after school.

## COMPUTER LAWS

The Computer Fraud and Abuse Act of 1986 made it a federal crime to intentionally access a computer without authority or by exceeding authority to obtain information to which one is not entitled. This act covered illegal access to computers owned or operated by the government, those connected to the government, and those involved in interstate and foreign commerce. The act has been amended a number of times to make it more responsive to changes in technology. States have also developed their own laws to make hacking a criminal offense.

The Economic Espionage Act (EEA) of 1996 was a response to the growing network of professional spies and saboteurs who earn enormous payments for hacking the computers of rival governments or businesses. These professionals are highly elusive and are capable of destroying computers and/or networks, crashing stock markets, or even bringing down governments. EEA made it a federal offense to profit in any way from the misappropriation of another person's trade secrets, including downloads, uploads, and e-mails.

## COMPUTER PROTECTION

A number of basic tools have been used to provide protection from computer hackers. The most commonly used method is to require passwords to gain access to particular systems, services, or programs. Computer security experts suggest that passwords should not be words found in dictionaries or words that are associated with a particular individual. A more sophisticated method of protection is to encrypt information so that hackers cannot easily read it. Firewalls are often used to block unauthorized access to an individual computer or network.

Anti-virus programs are used to identify, remove, or quarantine viruses and worms. These programs are only useful if they are updated on a regular bases because new viruses and worms are being created daily. The bottom line is that the only computer that is entirely safe from a knowledgeable,

determined computer hacker is a stand-alone computer with no form of outside access.

## conflict theory

CONFLICT THEORY and Marxism attempt to explain the exploitative dynamics of the Industrial Revolution that led to the mass production goods and the loss of the workers' control over their own creativity. Conflict theory primarily argues that it is the economic system of capitalism itself that produces crime.

Specifically, the Industrial Revolution primarily benefited the bourgeoisie, the owners of the means of production, while exploiting the land and the common worker, or the proletariat. Workers and the environment became tools or resources used to expand the wealth of the elite classes. Conflict theory hypothesizes that society is structured based upon the relationship of people to the production of material goods. In other words, those who own the means of production also control the workers, politicians, and development of criminal and civil law. Thus, the wealthy exploit the animals, the natural resources, other people, and the environment in

order to increase their power and wealth. According to conflict theory, the exploitation of the work force is a crime of economic domination in that it creates high levels of economic inequality, or gross disparities in income between the owners of the means of production and the proletariat or workers.

This inequality is result of the bourgeoisie's attempts to maximize their profits while minimizing their costs, specifically the wages of workers as well as the costs of maintaining the workplace. However, the workers sometimes strive to gain more control over their labor by improving their working conditions, their wages, and sharing in the profits from their labor. Thus, this relationship between the bourgeoisie (the owners) and the proletariat (the workers) is characterized by conflict. This antagonistic relationship, characterized by exploitation, alienation, domination, and inequality also explains crimes of resistance committed by the working class. These include workers' strikes, protests, walk-outs, and labor stoppages.

Conflict theory also explains crimes of repression committed by the wealthy, in conjunction with the state, in the development of criminal and civil laws that favor the elite classes and disfavor the working class and the poor. Crimes of repression include the violations of civil rights of workers, repression of union activity, the differential treatment of non-citizen workers from citizen workers, corporate welfare, and subsidies from the government, while welfare for poor families is characterized by politicians and the elite as the roots of all evil. Only two percent of the federal budget includes cash benefits for the poor while the subsidies for industry have cost taxpayers millions of dollars more.

Some criminologists might also argue today that crimes of repression violate the human rights of the working class all over the globe, including unfair wages, unsafe workplaces, air and water pollution, and a legal system that remains accessible only to those with sizable bank accounts. Finally, conflict theory also explains crimes committed by the working class against other members of the working class. This includes what are referred to as typical street crimes. However, because the wealthy control the culture or the media, they create an ideology that misrepresents the truth about corporate crime, that is, that street crime is more harmful and more deadly than corporate crime when the opposite is true. Moreover, the elite convince the workers that

the greatest threat to their jobs and income are from immigrants or other minority members who will “steal” their jobs. In fact, it is the bourgeoisie who exploit the labor of immigrants and minorities by paying them less than white workers in order to, once again, improve their profit margins.

In accomplishing this exchange of laborers and control over the consciousness of workers, the wealthy create a conflict among the workers prohibiting them from realizing that their real enemy or oppressor remains the elite. The only way to change these dynamics is to transform the capitalist economy to one in which workers would share in the profits. Some companies do maintain employee profit-sharing today.

## Conoco

CONOCO, or ConocoPhillips since the merger with Phillips Petroleum in 2002, is a major U.S.-based oil and petrochemical company with operations in 29 countries. As of 2002, the bulk of ConocoPhillips’ production operations were in the United States, Norway, and the United Kingdom with smaller operations in Canada, China, Dubai, Ecuador, Indonesia, Nigeria, Russia, Venezuela, and Vietnam.

The company also operates 18 refineries in the United States, the United Kingdom, the Czech Republic, Ireland, Germany, and Malaysia. The company’s 12 U.S. refineries make ConocoPhillips the largest oil refiner in America. The Conoco side of ConocoPhillips can trace its origins back to the Continental Oil and Transportation Company formed in 1875 to distribute petroleum products

across the American West. In 1884-85, Standard Oil acquired Continental Oil to distribute Standard Oil products.

In 1913, the company became independent after the break-up of the Standard Oil Trust. Short of oil supplies, Continental Oil merged with Marland Oil in 1928, forming the Continental Oil Company or Conoco. After a fierce takeover battle between Seagram, Mobil, Texaco, Marathon Oil and Unocal, DuPont bought Conoco in 1981 to secure access to cheap feedstock for DuPont’s chemical plants. DuPont divested Conoco in 1999 as part of a move away from the highly cyclical petrochemical business toward the life sciences. In 2002, Conoco and Phillips Petroleum merged in order to compete with super-majors like BP Amoco, ExxonMobil and Royal Dutch Shell.

Conoco has a mixed environmental record. In 1990, the company undertook to replace its fleet of single-hulled oil tankers with doubled-hulled tankers in response to the Exxon *Valdez* accident. That same year, Conoco paid \$23 million to settle a lawsuit brought by residents of Ponca City, Oklahoma who claimed that the Ponca City Refinery had polluted their groundwater.

During the past 10 years, Conoco has regularly fallen afoul of U.S. environmental protection regulations. The company accumulated the largest number of fines from the Oklahoma Department of Environmental Quality during the period of 1993–2001, paying \$250,000 for a series of self-reported violations between 1998 and 2001. For eight years until 1989, Conoco and Pioneer Nuclear Corporation ran a *de facto* low-level radioactive waste dump without a permit at the Conquista Uranium Mine in Texas.

Conoco has also been involved in a series of oil royalty disputes with federal and state authorities. In 1999, Conoco paid the state of California \$1.15 million to settle an oil royalty dispute. The company paid the federal government \$26 million to settle another oil royalty dispute in 2000. Conoco and several other vertically integrated oil companies evaded royalty payments, calculated as a percentage of the post price, by undervaluing the oil produced on state and federal land, making correspondingly lower royalty payments to the government.

## consent agreements, decrees, and orders

IN THE U.S. justice system, a consent agreement refers to a voluntary approval or mutual understanding between two or more people. Such an agreement may then provide authorization for some act or purpose. An order can be defined as a written command or direction that is delivered by a judge or a court. Similarly, a related term, decree, serves to convey a declaration of a court by announcing legal consequences of the facts in a particular case. In the field of white-collar crime, all three of these terms are typically heard most often with regard to corporate crime.

Beginning with the early work of Edwin Sutherland, who conducted research on both white-collar crime and corporate crime, criminologists have been interested in the punishment of these offenders. Compared to common or street criminals, the perception that white-collar workers and corporations are sanctioned more leniently has persisted. However, the public has increasingly supported the idea of stricter punishment for white-collar offenders and particularly, corporations. Many of the most serious forms of white-collar crime have been perpetrated by corporations. Some corporate crimes, such as those resulting in environmental pollution, other damages, or even death, are viewed by the public as more serious than others.

A variety of sanctions may be used against individual white-collar offenders or entire corporations. For corporations, one of the most common of these is a monetary fine. In addition to this regularly used sanction, prosecutors have also attached penalties and terms that are very specific to the offense. Fines and other types of penalties, such as commu-

nity service requirements, are regularly contained within consent agreements and court orders.

Although the terms of consent agreements and orders may vary, one recent example of corporate crime outlines some general terms. In this case, decided in the summer of 2001, Liberty Publishing, a telemarketing company operating in the state of Pennsylvania, was sued for engaging in deceptive business practices and intimidation tactics during the course of a fundraising campaign. Although the campaign raised over \$3 million for police organizations, numerous acts of deception were uncovered. The consent agreement included the following specific terms: the company was banned from telemarketing in the state of Pennsylvania, its owner was ordered to pay \$75,000 in restitution to consumers, as well as investigation costs and civil penalties.

## consequences of white-collar crime

WHITE-COLLAR CRIME IS massive in its impact. It takes a toll on individuals specifically and society in general. Its toll can be characterized as economic harm, physical harm, and emotional harm. In terms of economic losses, criminologists agree that billions of dollars are lost annually to white-collar crime. In the savings and loan crisis alone, experts suggest that up to \$500 billion was lost to fraud. Estimates from the federal government suggest that white-collar crime costs up to 15 times as much as street crime. Not included in these estimates are the enormous ancillary economic costs that come along with the prevention, investigation, and prosecution of these offenses.

Economic costs are also experienced by individual victims. Whereas the average robbery nets

around \$900, the average bank fraud amounts to about \$100,000. White-collar crime victims often lose their entire life savings. Also, whereas one robbery usually only victimizes one person, a white-collar scheme generally victimizes hundreds or evens thousands of individuals.

Physical costs also arise. It is not uncommon to hear of financial fraud victims experiencing health problems, but it is not just these white-collar crimes that lead to physical consequences. Unsafe products, unsafe working environments, and other corporate misdeeds cause far more deaths than are caused by criminal homicides each year. Attention to unsafe working environments surfaced when concern spread about exposure to asbestos in the 1980s. Today, individuals are still suffering the consequences of unsafe exposures to asbestos and other poisons and pollutants from decades ago.

There are also serious health consequences that are experienced by environmental crime victims. Love Canal is just one example: Between 1942 and 1953, the Hooker Chemical plant dumped its chemical wastes in an abandoned canal near Buffalo, New York. The canal was covered, and Hooker sold the property to a local board of education. An elementary school was eventually built on the site. In the mid-1970s, residents became aware of the problem. Investigators soon learned that residents near the canal had experienced a number of physical problems. One year, just one of 16 children born near the canal was born without any serious ailments.

Emotional costs also come along with white-collar crime. The most cited emotional cost has to do with the loss of trust that society experiences. Just as traditional crime victims and their contacts experience a higher fear of crime after victimization, those directly and indirectly victimized by white-collar crime experience a similar sort of fear—fear about their finances, their well-being, and so on. In a similar vein, legal scholar John Coffee has described demoralization costs that come along with white-collar crime. When individuals hear of supposedly “well-respected” individuals getting away with things at work, they become more likely to transgress as well. White-collar crime’s reach generally touches everyone. Brian Payne cites a study (2002) suggesting that one in three individuals is a victim of fraud every year. Taking this a step further, one could suggest that every individual in the United States is a potentially a victim of white-collar crime every three years.

## conspiracy

**LAWS AGAINST CRIMINAL** conspiracies were primarily enacted to combat organized crime. The crime of conspiracy is constituted by the agreement to act in concert with one or more persons to commit a crime. Agreement is the crime, and anyone consenting to participate can be criminally charged even if she did not carry out her part for the commission of the crime. Courts recognize people in a conspiratorial relationship have a much greater chance of successfully engaging in and covering-up more profitable and destructive offenses than a lone offender.

Many corporate crimes require a conspiratorial arrangement. Not only does the criminal conspiracy increase the odds of attaining an illegal goal, but it also brings the greater resources of a corporation to assist. Consequently white-collar crimes occurring in corporate or governmental organizations contain elements of criminal conspiracy. Classic examples are the Watergate scandal, the Heavy Electrical Equipment Price-Fixing Conspiracy, and savings and loans land-flip deals in the 1980s.

The need for collusion to commit many white-collar offenses is easily demonstrated. For example, to carry out land-flip deals between savings and loans in the 1980s, each institution traded the same piece of low-value real estate back and forth. With each transaction the “value” of the land increased creating evidence on paper of a higher selling price, and, therefore of higher value. After a few transactions the “paper value” of the land went from next-to-worthless to extremely high. Each savings and

loan official knew the property he authorized to purchase or sell was worthless. Once a high value was established by the inflated sale price, the property was used as collateral for a large loan executives had little concern about repaying. The scheme required officials in each institution to enter a prior agreement to engage in fraudulent sales.

An interesting aspect of criminal conspiracies is how well evidence of their existence is hidden. In that regard, the Heavy Electrical Equipment Price Fixing Conspiracy was a classic. Representatives from all companies that manufactured electrical equipment agreed before-hand which company would get a contract and what the price of various pieces of equipment would be. Following accepted practices, buyers submitted bids for expensive items such as generators and transformers to each company and the lowest bidder got the contract. Every company that bid was party to the conspiracy. The electrical-equipment companies designated which manufacturer among them would get a given contract by rigging bids in such a way as to leave little evidence of collusion. The arrangement allowed the conspirators to maintain an inflated price for all equipment for the benefit of every company.

#### PHASES OF THE MOON

The brilliance of the scheme was how bids were rigged. Before any bids were received, the conspirators agreed on equipment prices. Depending on what phase the moon was in on the day bids were asked for, the equipment companies determined which company would submit the lowest bid. The lowest bid was the agreed-upon price set for a particular piece of equipment. All other companies submitted higher bids. For example, on full-moon phases, one company got the job and on half-moons another, and so on. Over time, each received its share of contracts at the highest agreed-upon price no matter what was ordered. Conspirators did not have to talk with one another since each knew exactly how to bid in advance to further the common interest of maintaining an artificially high price.

Entering a conspiracy subjects one to criminal charges that cannot be mitigated by arguing one did not carry out her part of the plot, or had no knowledge of the whole scheme. Watergate is a classic example as each conspirator committed different acts to attain the common illegal goal. Some committed burglary, others obstructed justice, made illegal pay

offs, violated other people's civil rights, and quite a few committed perjury. All, however, were indicted together. In a criminal conspiracy, every party to it is equally culpable, knowing its objective is illegal.

Applying laws against criminal conspiracy can be problematic. Perhaps the greatest criticism is that relatively minor crimes make offenders open to indictment under conspiracy laws if cooperation is evident. The penalties for collusion can be much greater than those for the crime that is the object of the conspiracy.

The most effective application of conspiracy law has been in prosecuting organized crime when combined with the Racketeer Influenced and Corrupt Organizations Act (RICO). RICO statutes make prosecution of a criminal organization possible when different members are arrested at different times, but for the same offense, which is evidence of a corrupt organization engaged in a conspiracy with crime as its goal.

## consumer deaths

CONSUMER DEATHS are those suffered by people as a direct result of using a product they have purchased. When deaths as a result of tobacco- and

alcohol-related diseases as well as from automobile accidents are included, the number of deaths can annually be very high. One report from the Consumer Product Safety Commission listed 4,639 deaths in the United States from October 1999 to September 2000 resulting from household products such as home furnishing and fixtures, and household appliances, with the largest category relating to sports and recreational goods and at an estimated economic cost of more than \$330 billion. By contrast, the World Health Organization (WHO) estimates that 4.9 million people die annually as a result of tobacco use alcohol-related deaths (including drunk-driving incidents) amounted to 33,000 in the United Kingdom (UK) in 2000. Another cause of consumer deaths comes from guns, and WHO estimates in South Africa, for example, 12,000 people were killed by guns, with higher levels of danger in the gun-owner population. These statistics, as well as those in other countries of which they are representative, are frequently contested for political reasons or in attempts to reduce liability.

#### CAUSALITY AND LIABILITY

Key issues in the area of consumer deaths include those of causality, that is, did the product itself cause the death or was it a result of misuse or coincidental? Did the company producing the product exercise an appropriate duty of care in ensuring that its products were safe, and had no reason to believe that any dangers were attached to them?

The standards of proof required in courts of law relating to these questions varies from country to country and the litigation process is often intense, because of the emotive nature of the cases and because of the potentially high level of compensation involved. The degree of culpability of the product producers can vary according to the degree to which consumers are expected to understand risks, and to protect themselves accordingly. This creates something of a spectrum of possible cases: ranging from children who are poisoned the toys to deaths from overuse of illegally obtained narcotics, for which there is much less public sympathy.

Nevertheless, when the supplier of a product is negligent in determining whether or not risks are involved with the marketing of goods and services, then the supplier can be prosecuted in most states. Most cases, of course, fall somewhere between the two extremes.

When the drug thalidomide came on the market in 1958, for example, the dangers to the unborn fetus were not recognized during research, and when thousands of children were subsequently born with severe deformities, then subsequent legal discussion centered on the degree to which more care should have been taken to identify possible dangers.

When thalidomide subsequently began to be identified as having additional special medical properties, it was able to be marketed under certain circumstances with its risks properly noted. The energy drink Red Bull was linked to the deaths of three young people in Sweden and has subsequently been banned in several countries. Two of the three people involved had mixed the drink with vodka and the other was said to have drunk several bottles and exercised strenuously. These details have been sufficient to deflect investigations in most countries, since a small amount of risk is considered inherent in any unforeseen circumstance.

On a larger scale, this difficulty of proving liability has been evident in the case of tires for vehicles, and the extent to which accidents may be attributable to them. It is self-evident that there is always a risk attendant upon personal transportation and that driver error is likely to be the highest risk factor, whether to the driver or her passengers or other third parties. Flaws in tires (as in the Firestone case) and other parts of the automobile may be evident without them necessarily contributing significantly to the incidence of death or injury.

Nevertheless, safety experts stress the source of such flaws must be identified and appropriate measures adopted. In an era in which production may be divided between different business units or contracted out to another operator altogether, then it is of considerable importance to identify the source of the flaw, whether in the design process, the production process or some other stage of production.

These complications have made it difficult to secure convictions. Through a combination of imprecision of liability and lack of full legislative cover, in countries such as the United States, business has a strong influence in government, and pressure may be brought to bear to limit liability, despite the clear public interest in ensuring that corporate wrongdoing be prevented. The fragmentation of industries as a result of privatization also makes the maintenance of appropriately high level of safety standards more difficult; private compa-

nies may feel more pressure to show a short-term profit and hence defer investment costs in safety.

Even when appropriate legislation is introduced, it can be very difficult to secure convictions because of the problems of identifying the individuals directly responsible for the deaths. This has been the case when people are killed in transportation accidents, crowd trampling, or fire disasters.

## Consumer Product Safety Act

WHAT RESPONSIBILITY does a company have to inform existing and potential consumers of unsafe products? The Consumer Product Safety Act was enacted in 1972 as a response to perceptions that product liability laws did not sufficiently protect consumers from unsafe products. To implement the act, the Consumer Product Safety Commission was created. The Commission was made responsible for administering additional consumer protection laws, including the Federal Hazardous Substances Act and the Flammable Fabrics Act.

The commission has a broad jurisdiction over items specifically designated consumer products, which are defined as “any article or part produced for sale to a consumer for use in a household, in a school, or in recreation.” All consumer products

are subject to the act’s mandatory, minimum reporting requirements. Penalties for failing to comply with the act are in place, and include up to \$5,000 per product. Companies may also be subject to criminal penalties if they knowingly commit violations. The act requires that manufacturers, distributors, importers, and retailers immediately inform the commission if any product fails to comply with safety standards, contains a defect that could create a hazard, or creates unreasonable risk of serious injuries or death. If a product is the subject of at least three civil suits within a two-year period, companies are required to file a report with the commission. To protect consumers and avoid penalties, manufacturers must develop policies that enable them to comply with the act.

Estimates in the early 2000s indicated approximately 20 million Americans have suffered injuries from the use of unsafe products. Additionally, of the 20 million victims, 110,000 have been permanently disabled due to unsafe products, while another 30,000 have died. Many researchers studying white-collar or corporate crime have focused their interests on unsafe products in different types of industries. The existing research efforts have provided students in criminology and other fields with a great deal of information on unsafe products and related crimes against consumers.

The potential for unsafe products exists in all industries, although some have received more publicity than others. The automobile industry, particularly Ford Motor Company and General Motors, has been connected to many cases of unsafe products resulting in gross injuries and deaths of consumers. Criminologists have studied the famous Ford Pinto cases of the 1970s, in which the fuel systems burst in read-end collisions. Investigations revealed that Ford was aware of the potential problem during their pre-production stage of the Pinto. Ford estimated that it would cost only \$11 per automobile to fix the problem.

The company’s cost-benefit analysis determined that Ford could save \$87.5 million if they kept manufacturing cars that were expected to injure or kill consumers. Ford’s rational estimates later proved to be unreliable, as more crashes than they anticipated actually occurred, and many class-action lawsuits against the automaker were initiated. Judgments against Ford repeatedly took place, including a 1978 jury award of \$127.8 million to one teenage victim. Following this particular decision,

the Department of Transportation announced a recall of the Pintos.

## contractor fraud

HOME CONTRACTOR fraud refers to a range of illegal practices committed by contracting firms in repairs and renovations on residential dwellings and financial arrangements associated with this type of work. According to state consumer protection agencies, it ranks among the most common types of consumer fraud in the United States. The most common illegal acts include unnecessary repairs, misrepresentation, bill padding, defective workmanship and home-improvement loan fraud. Such actions generally fall under conventional legal definitions of property theft and fraud, that is, deliberate and deceitful practices intended to gain financial advantage.

Home contracting fraud has come under increasing scrutiny in recent years due to the substantial economic investment Americans make in home repairs. According to the Center for Housing Studies at Harvard University, every year 26 million Americans engage in home improvement projects on their homes, spending in total over \$100 billion. One million of these homeowners spend sums of over \$10,000 on large structural modifications. In

*Unscrupulous home contractors target the 26 million homeowners in America who remodel homes each year.*

addition, the expansion of consumer protection organizations and legislative and judicial initiatives at the state and federal level have drawn significant attention to home contractor fraud. The victims of fraudulent home-improvement work are often elderly and unsuspecting consumers unaware of their legal rights or deceived into unnecessary, overly expensive and often damaging repair work or upgrades on their homes.

According to the American Association of Retired Persons (AARP), certain groups such as older, minority, and lower income persons are more vulnerable to fraud, and are over-represented in cases of illegal home contracting practices. Senior citizens, in particular, are disproportionately represented among homeowners who have accumulated substantial home equity and therefore have much to lose from fraud. Since home repairs and upgrades are usually expensive, they offer prime opportunities for unscrupulous firms that exploit people they see as overly trusting and ignorant of their legal rights.

### THE CONTRACTORS

Consumer advocacy groups have painted a vivid portrait of the typical fraudulent contractor. Often, fraudulent contractors are small-scale and defraud a small number of clients for thousands of dollars. In some notable cases, home-contractor fraud has in-

volved dozens of home owners and much larger sums of money. Many so-called contractors are employees of larger contracting firms who “moonlight” or find work on the side. They are generally not licensed, bonded, or insured. Nor do they belong to a reputable professional association which abides by ethical codes and standards.

Such businesses are therefore often unable to properly obtain legally required building permits, protect clients from sub-contractor abuses, potential liens on homes, and other home-owner legal liabilities, nor provide health insurance and workers’ compensation for those employed on the job. Sometimes, contractors insist clients obtain home-improvement loans from third parties with which they are associated. They do not provide references from former clients, have no permanent offices or contact numbers, accept only cash, demand full payment up front and refuse to enter into a formal written agreement outlining the rights and responsibilities of each party. This suggests that they are a “fly-by-night” operation intent on defrauding clients. Unscrupulous contracting firms solicit door-to-door and offer extraordinary “too good to be true” discounts and guarantees. Consumer groups warn that any or all of the above are warning signals for contractor fraud.

## THE SCAMS

One of the most prevalent illegal acts in home contracting is outright theft of property and money. A supposed contractor knocks at a homeowners’ door offering cheap and rapid work. He claims he needs money for supplies immediately and offers not to charge for the work until the job is completed. After the client provides the money, he simply does not return with the supplies. Occasionally, such contractors begin work on the project before leaving to buy supplies. The homeowner is thus left with damages to the property as well as theft of money. Other typical complaints of this type involve work that was paid for, but never done or equipment that was purchased, but not delivered. Consumer groups state that this type of illegal practice constitutes the most common form of home contracting abuse.

Another illegal act consists of unnecessary or faulty repairs and cleaning done at exorbitant costs. Such contractors solicit clients door-to-door offering to provide a free inspection or cleaning of a part

*Fraud experts advise homeowners to avoid offers made over the phone or that sound too good to be true.*

of the house. Inevitably, costly repairs are found to be necessary. Clients generally have little knowledge of what is actually necessary and fraudulent contractors prey on their fears of potential damages in the event of bad weather or accident. Senior citizens’ organizations have noted that roof repairs and chimney cleaning are frequently the object of such swindles. Contractors claim that new materials or upgrades are needed to avoid dangerous consequences such as fire and structural damage. In the case of chimney repair, some questionable contractors have been known to intentionally damage furnaces, arguing that carbon dioxide is leaking and could lead to fatalities. They then strongly recommend exorbitantly expensive, on-the-spot replacement of “defective” materials. Frequently, the resulting work does not meet industry standards. Victims end up losing substantial sums of money for repair work that needs to be redone.

Another growing type of fraud involves contractors convincing homeowners to file claims with their insurance companies for damages to the home. The contractor approaches clients whose homes require repairs and claims that he can help them get the repairs done at no cost. In these cases, the contractor may create extra damage to certain parts of the home to inflate the insurance claim and then counsels the client to file a claim. The contractor produces a carefully crafted written agreement to perform all the repairs without charging the home-

owner the deductible. This written contract often does not include anything strictly illegal, yet what the homeowner did in filing the claim actually constitutes serious insurance fraud and she is liable in the event of an investigation by the insurance company. Insurance companies have been particularly diligent in recent years and have compiled lists of suspected contractors involved in these schemes.

Contractorfraud.net, a leading consumer rights organization on the internet, has also received numerous reports of fraudulent home-repair activities by groups of so-called travelers, especially in western states. Offering a "great deal" in roofing, painting, and asphalt repair services, it has been alleged they use defective materials and change the size and price of the job without agreement. Property owners who have requested payment by check have been accompanied by the contractors to the bank to cash checks immediately thereby preventing a stop-payment on the check.

Other defrauded clients have stated that they were physically intimidated by the contractors to pay for partial and poor quality services. Illegal schemes like this have affected both individual home owners and small businesses. In one case, a small business owner entered into a verbal agreement for a group of travelers to pave the parking lot of his business. The job was not completed nor satisfactory but the "contractors" demanded payment of \$10,000. The client felt physically threatened and ended up paying them \$1,000 just to leave the property.

Fraudulent home contracting has been particularly prevalent in the wake of natural disasters. Homeowners affected by floods, hurricanes, and tornadoes have been victim to a number of dubious practices. Homeowners in this situation are particularly vulnerable because they require immediate repairs for safety reasons. Numerous cases have arisen of shoddy and/or expensive work by disreputable home construction firms. After heavy storms damaged numerous properties in Mississippi, the state Emergency Management Agency received several reports of fraudulent home contracting schemes.

In a Florida case, a person was charged for impersonating a building inspector who showed up at several homes after a hurricane caused extensive damage to residential properties. The convicted man posed as a state official and ordered immediate repairs which were later done by his own company. In other cases, persons pretending to be govern-

ment officials demanded fees for processing emergency loans documents.

A relatively recent form of home-contracting fraud consists of illegal home-equity loan scams. Nationally, home equity fraud in the 1990s stripped the value from the homes of an estimated 100,000 people in 29 states. Homeowners requiring money for large-scale repairs are able to apply for loans based on the equity of their home. Numerous cases have arisen in which contractors go door-to-door offering to assist clients to acquire the loans, but end up performing poor quality, incomplete, and costly jobs. Worse yet, clients are saddled with expensive monthly payments, high interest rates, and exorbitant financial fees. "Balloon payment" home equity loans are particularly dangerous. These are loan arrangements in which monthly payments are manageable, but the large payment due at the end of the agreement is unaffordable. Sometimes, clients are swindled into offers of further loans to refinance the balloon payment, creating a vicious circle of debt. In many of these cases, the contractor is associated with the lender and receives a fee for finding prospective borrowers. The debt burden for clients has led to foreclosure on some homeowners' properties.

## GOVERNMENT FRAUD

Financial fraud has been especially persistent in the federally financed Title 1 home-improvement loan program. Since the mid-1980s, internal audits within the Department of Housing and Urban Development (HUD) have discovered extensive corruption by home contractors. Over half the applications for this program come from low-income families, many of them senior citizens. This 60-year old program allows contractors, as well as lending institutions, to initiate loan applications for clients ranging from under \$5,000 to a maximum of \$25,000 for home renovations. Home contractors advertise door-to-door or through newspaper advertisements, offering to help homeowners secure loans under Title 1.

Commonly, the contractors falsely advertise that loans have been pre-approved and fail to complete work, falsify work as completed, and/or coerce borrowers into claiming that work was completed. Other abuses include working with borrowers to falsify financial information such as income, assets and liabilities; securing loans for

homeowners who do not have the income to repay the loans; and falsifying loan documents to exceed their borrowing limits.

An extensive review of the program in 2002 by HUD highlighted widespread evidence of shoddy work, falsification of documents, over-priced work, and deceptive advertising by home contractors. In addition to the financial damages to home owners, the taxpayer also loses. Each time a homeowner defaults on the loan, HUD is responsible for paying lending institutions. From 1987 to 1996, HUD paid \$114 million in claims on contractor-originated loans. In 2002, HUD initiated a process to abolish the contractor-originated portion of the program due to extensive corruption and abuse by home contractors. New rules limited Title 1 loans to reputable lending institutions.

HUD also publicly named a number of contracting firms that it was prosecuting and penalizing for irregularities and illegal practices. It barred four Texas contractors from doing business with the federal government as a result of investigations. A further 10 contractors in Arkansas, Texas, New Jersey, and Missouri were prohibited for one year from participating in the Title 1 program and levied civil penalties of up to \$5,500.

Two more contractors in Alabama and Denver, Colorado, were barred from launching Title 1 loans. HUD has promised to extend its investigation to other states such as California, Pennsylvania, and Illinois where contractor-originated loans are prevalent.

## PROSECUTION

Until the 1960s, home-contracting fraud was routinely prosecuted under general legislation governing fraud, theft, and breaches of contract. Some illegal practices in home improvements are today prosecuted through legislation governing theft, that is, in the case of building materials or money stolen by contractors. Fraud has gradually come to be defined by courts as an intentional misrepresentation that was relied upon by the plaintiffs and caused them damages. The quality of evidence required to prove fraud, however, differs according to state.

Consumers may also rely on legislation governing contracts to sue contractors for breaching the terms of formal and informal agreements. Verbal agreements for contract work, for instance, may be legally cancelled in all states within three days if the

client notifies the contractor in writing. Yet it can be difficult to prove that an act of misrepresentation was intentional. Moreover, victims of fraud seldom admit it so many cases go unreported. Defrauded homeowners can also rely on general legal protections for all consumers encoded in federal and state legislation. Section 5 of the Federal Trade Commission Act states that “unfair or deceptive acts or practices in or affecting commerce” are illegal and state legislation closely follows these federal guidelines. Most states have passed explicit consumer protection acts (CPA), deceptive business practices statutes and/or home improvement contractor legislation. Others have established compulsory registries of firms engaged in home repairs that can be publicly accessed by consumers. Many CPAs allow plaintiffs to sue for damages and legal fees, but clear misrepresentation or deceit on the part of contractors and clear damages suffered by plaintiffs need to be established. In the absence of written contracts, clients who sue for damages need to provide substantial evidence to successfully sue contractors for compensation resulting from home repairs.

The state of Massachusetts’ Home Improvement Contractor Registration Law is a noteworthy example of state-based legislation to combat home-contracting fraud. It was passed in 1992 to reduce illegal practices and provide protection for homeowners. It provides for a state registry of approved contractors whose work and financial practices are guaranteed by the government. Contractors are required to display their license number on all advertisements, contracts, and permits. For jobs over \$1,000, a formal written contract is compulsory. Contractors are expressly forbidden from lending money or to act in concert with lending institutions in cases of home-equity loans. Contractors are not allowed to force clients to borrow from specific lenders if the home is used as collateral.

The legislation also provides for the inclusion of consumer cautions and special notifications such as detailed work plans, a completion schedule, and final cost and payment schedules in all contracts. It offers state-sponsored arbitration to resolve disputes arising between homeowners and contractors. Another important section of the legislation, the Residential Contractors Guaranty Fund, provides for financial compensation for consumers who have been awarded judgements against contractors and have not been paid.

A case from Alabama in 2001 illustrates a typical case of home contracting theft and the resulting legal action. Home contractor, Jack Davidson, entered into agreements with 17 homeowners in Shelby County, arguing that they would be reimbursed for what they paid him for home repairs through an existing nationwide class action settlement for Masonite siding. He solicited money from the clients up front, claiming that he would process their claims in the class action suit and refund their money.

Yet none of the clients qualified for any proposed damages from the class action suit, and Davidson had no connection whatsoever to the case. Moreover, he never conducted the repairs. In addition, Davidson also falsely claimed that he was a licensed and bonded contractor registered with the Better Business Bureau. Davidson was sentenced to prison for first-degree theft and ordered to repay \$247,000 to compensate his victims.

Consumer protection agencies such as contractorfraud.net and state-based Better Business Bureaus provide extensive information on avoiding such unscrupulous and illegal acts, and recommend courses of legal action for defrauded clients.

They generally recommend that homeowners avoid extraordinarily cheap offers; refuse telephone or door-to-door solicitations; carefully check contractors' references from former clients; consult the Better Business Bureau or state registries to confirm that the contractors are legitimate; solicit bids from several contractors; and, most importantly, enter into formal, written contracts, which detail all aspects of the work including costs and payment. In sum, buyer beware.

## Contra-Gate

WHILE THE arms-for-hostages deal with Iran (Iran-Gate) and the supply of military aid to the Nicaraguan Contras (Contra-Gate) are generally referred to under the umbrella term Iran-Contra, the two distinct events occurred on two separate continents. It was only when the idea of using the proceeds from the Iranian arms sales to provide aid to the Contras, after Congress passed the Boland Amendment banning such action, that the two distinct operations became connected. The cover-up that followed irrevocably tied the two events together in the minds of the American people. By the time all investigations into the Iran-Contra affair were completed, the total cost to the American people reached \$48.5 million

Iran-Contra is definitely one of the worst foreign policy fiascos in American history. While the administration of Ronald Reagan was involved in damage control, little was accomplished in the area of foreign policy. Even though Reagan was not removed from office, the popular president's reputation was tarnished; and he never quite recovered from the loss of public trust. Immediately after the Iran-Contra scandal broke in November 1986, Reagan's approval ratings fell by an unprecedented 21 percent. When Howard Baker replaced Donald Regan as chief of staff in February 1987, he agreed to accept the position only if he were allowed to conduct an investigation into affairs at the White House. Baker concluded that the president was not in control of the White House or of the executive branch.

#### IRAN-GATE

Until the Shah of Iran was deposed in early 1979, the United States shared an amicable relationship with this oil-producing Muslim country. However, when the Ayatollah Khomeini gained power, the United States became the "great satan" to his followers. In November 1979, 52 American hostages

were taken at the United States embassy in Tehran, the Iranian capital. They were held for 14 months. During this period, President Jimmy Carter banned all trade with Iran. In retaliation for Carter's briefly harboring the ailing Shah, the Iranians refused to release the hostages until Reagan became president at noon on January 20, 1981. Within minutes, the plane carrying the hostages left Iran for Germany. The Iranian government under Khomeini was well known for its aid to terrorist organizations and was thought to be responsible for the taking of additional American hostages on a number of occasions. The Reagan administration emphatically stated that the United States would not trade arms for hostages and would not concede to terrorist demands. In the spring of 1983, the State Department announced Operation Staunch, which was designed to use American influence to keep other countries from selling arms to Iran. Records show that as early as 1981, the Reagan administration was considering selling arms to Iran, even though the White House was well aware of the Iranian connection to the terrorist murder of 241 U.S. Marines in Beirut, Lebanon, and despite the fact that the Iranian government had sanctioned the taking of American hostages and had committed numerous acts of terrorism.

## CONTRA-GATE

On July 17, 1979, the regime of Anastasio Somoza collapsed in Nicaragua, and the National Liberation Front, a communist party known as the Sandinistas, seized power. In February 1981, the Reagan administration announced that it was suspending all aid to Nicaragua. However, Reagan's administration was committed to furthering conservative goals in Central American, and realization of those goals involved supporting rightist governments against leftist governments whenever possible. Reagan decided to increase military aid to El Salvador, Honduras, and Guatemala. His actions in Nicaragua, however, went beyond traditional military aid. Central Intelligence Agency (CIA) operatives were used to train anti-Sandinista or Contra guerrillas and were heavily involved in intelligence initiatives, including mining Nicaraguan harbors.

When Reagan announced that he would support the efforts of the Contras to unseat the controlling Sandinista regime, Democrats in Congress were outraged and pointed out that the human

rights records of the Contras was not much better than that of the Sandinistas. Beginning with an appropriation of \$19 million in 1982, the United States provided the Nicaraguan Contras with \$321.65 million. Approximately \$179 million was earmarked for nonmilitary purposes. The rest was used to fund the Contras' guerrilla activities. After Congress prohibited aid to the Contras, Reagan raised \$44 million from third-party countries and an additional \$10 million from private donors in the United States.

## THE PLAYERS

When Congress prohibited the use of the CIA and the Department of Defense in covert activities, the Reagan administration assigned the job to the National Security Council (NSC). On August 4, 1981, Marine Lieutenant Colonel Oliver North had joined the National Security Council. Two years later, North and his boss Robert "Bud" McFarlane had accompanied former secretary of state Henry Kissinger to Central America. Shortly thereafter, North was designated as "point man" to deal with Contra activities. By summer, Richard Secord had been added to the team. Secord and his partner Albert Hakim, an Iranian exile, created a company, Enterprise, to carry out the covert operations in Nicaragua. Over the 19 months of the war, Enterprise earned \$45 million. While \$15.2 million was used to pay for the arms that were sold, another \$16.5 million was used to fund the Contras. Secord and Hakim netted \$6.6 million from the deal. North reportedly set aside \$4,300 for his personal use.

By 1985, McFarlane reported that he had received authorization from Reagan to begin negotiating an arms-for-hostage deal with the moderates in Iran. The arms were to be channeled through Israel; and by August 20, the first 96 TOW missiles were shipped, followed by a second shipment of 408 TOW missiles on September 18.

Even though no hostages were released, an additional 1,000 TOW missiles were shipped to Iran on January 2, 1986, followed by a fourth shipment of 4,000 TOWs two weeks later and an additional 500 TOWs on February 17. In early October 1986, a C-123 aircraft carrying arms, uniforms, medicine, and other supplies was shot down in Nicaragua, providing a link to the CIA. At the end of the month, an additional 500 TOWs were shipped to Iran. In all,

the United States supplied Iran, the country that most Americans saw as a bitter enemy, with \$12 million in weapons and spare parts, violating arms export laws in the process. In the face of a Congressional ban on funding to the Nicaraguan Contras, millions of dollars had been placed in Swiss bank accounts for use by the Contras.

## THE SCANDAL

On November 3, 1986, *al-Shiraa*, a Lebanese weekly newspaper, broke the story that the United States had sold arms to Iran in exchange for hostages held in Lebanon. Countries around the world denounced the United States, calling the Reagan administration hypocritical for its claims that it would not trade arms for hostages or make concessions to terrorists. Within days, members of Congress were calling for an investigation into North's activities. A week later, CBS aired a report alleging a direct link between the White House and North's activities in Nicaragua.

In his first public statement after the scandal broke, Reagan insisted that *al-Shiraa's* report had "no foundation." This statement was followed on November 13 by the admission that the United States had sold arms to Iran, but Reagan insisted that the claim that arms were sold in exchange for hostages was "utterly false." On November 19, 1986, Reagan held what was surely the most disastrous press conference of his presidency, emphatically denying that a third country had been involved in the sale. He compounded his false statements by declaring that all the weapons that had been sold to Iran "could be put in one cargo plane." Twenty minutes later, the White House issued an official retraction of both statements. Investigators later learned that at this same time North, and his secretary Fawn Hall, were shredding and removing documents from his office as fast as they could. On November 22, Department of Justice officials found the "smoking gun," a memo in which North admitted that profits from Iranian arms sales had been used to fund the Contras.

Once the two stories broke, Attorney General Edwin Meese was told that he had three days to investigate the rumors and make an initial report. As more details surfaced, Meese was afraid that Reagan would be forced to resign from office like Richard Nixon, or even be impeached. Meese's investigation was criticized for being cursory since he took no

notes when he interviewed key witnesses and made no attempt to stop the destruction or removal of evidence. During the November 21 press conference, Reagan's advisers were afraid he would get himself in more trouble with the press and with the public, so the responsibility for damage control lay with Meese who insisted that the president had not authorized the arms sale and that he had not been "fully informed" about what was being done in his name. Meese did, however, acknowledge that the Iranian arms sales had funded the Contras. Within days, John Poindexter, who had replaced McFarlane as national security adviser, resigned from NSC and North was "relieved of his duties." McFarlane who swore that everything he did had been done on the president's behalf later tried to commit suicide. It soon became clear that North had been designated as the fall guy for Contra-Gate. Even so, the scandal raised a general alarm over whether the president was in control at the White House.

## THE INVESTIGATIONS

With Watergate still fresh in the minds of many Americans, the Reagan administration was wise enough to know consequences would be less devastating if the president appeared to cooperate with the investigation, and if he avoided being charged with covering up clandestine activities as Nixon had done.

Three separate investigations into the Iran-Contra scandal took place simultaneously. On November 26, 1986, Reagan appointed a special board, headed by former Texas Senator John Tower, to investigate the activities of the National Security Council staff. Congress also announced that it would open investigations; and in December 1986, a joint committee held closed hearings. Both Poindexter and North initially invoked their Fifth Amendment rights. Yet, because Congress wanted to know the truth, both North and Poindexter were finally granted immunity. On November 18, 1987, the Iran-Contra committee issued a scathing report of its investigation. Congress accused the Reagan administration of secrecy, deception, disregard for the law, pervasive dishonesty, and a "seriously flawed" policy-making process. The committee concluded that Reagan had allowed a "cabal of the zealots" to make major policy decisions. The report issued by the Tower Board was not much better. Tower charged the president with failing to provide

oversight and for being unaware of what was being done in his name. The president, in Tower's view, had failed in his constitutional duties. Tower concluded that North, a "fanciful freewheeler," had engineered the whole Contra-Gate scandal.

On December 19, 1986, Lawrence E. Walsh was named independent counsel and charged with investigating both the sale of arms to Iran and the diversion of funds to the Nicaraguan Contras. Ultimately, Walsh charged Poindexter, North, Secord and Hakim. All five were later indicted on charges that included conspiracy to defraud the United States, obstruction of justice, wire fraud, lying to Congress, and destroying and removing documents. Republicans reacted to Walsh's charges by demanding that he be investigated and accused him of scare tactics with witnesses. They also questioned the money Walsh spent on the investigation.

Poindexter was given immunity in return for testifying against North in the criminal trial. Throughout the investigation, North was pursued more diligently than other defendants. It is hard to imagine that a military officer who had been trained for years to obey his superiors and to act according to a certain chain of command would make decisions of international importance without the proper authorization. North's trial was delayed because of the 1988 presidential election; but on February 21, 1989, North was tried on 16 separate counts and found guilty on three charges dealing with lying to Congress, obstructing justice, and altering, removing, and destroying documents. He was given a three-year suspended sentence, ordered to pay a \$150,000 fine, and sentenced to 1200 hours of community service. Federal appeals courts in Washington, D.C. later overturned the convictions of North and Poindexter on the grounds that congressional immunity had tainted the special prosecutor's cases against them.

In July 1985, Elliott Abrams was sworn in as the assistant secretary for inter-American affairs and soon became involved in the covert operations in Nicaragua. On October 7, 1991, Abrams pled guilty to two counts of withholding information from the U.S. Congress. The following month, Abrams was sentenced to two years probation and given 100 hours of community service. In 1993, Abrams published his own version of the events in *Undue Process: A Story of How Political Differences Are Turned into Crimes*. The choice of book title is indicative of the way that most participants in the

Iran-Gate affair perceived their actions. They saw their legal troubles as a battle between conservatives and liberals rather than as a choice between obeying the laws or choosing to disregard them.

#### GEORGE H. W. BUSH

Even though it was common knowledge that Vice President George Bush, a former CIA director, sat in on all meetings dealing with foreign policy, everyone interviewed in the Iran-Contra affair lost their memories when they were asked if the Vice President had attended a meeting where arms sales to Iran or covert actions in Nicaragua were discussed. The loss of memory was convenient for Bush who planned to run for president in 1988. In the Oval Office, Bush was in an ideal place to put an end to the investigations that had carried over into his presidency. In November 1992, Bush lost the election to Democrat Bill Clinton who, it could be argued, was likely to pursue further investigations into Contra-Gate with enthusiasm. On Christmas Eve 1992, Bush pardoned six individuals who had either participated in the original Contra-Gate affair or who had been indicted for their parts in the coverup that took place in the scramble to save the Reagan presidency. In addition to McFarlane, Abrams, and former Secretary of Defense Caspar Weinberger, Bush handed down Christmas Eve pardons for Duane Clarridge, Alan Fiers, and Clair George who had been charged with withholding information from Congress. Information released after North's diaries were declassified in 1993, led researchers to conclude that the Contra-Gate covert activities were run partly out of the office of then Vice President Bush.

## Coolidge, Calvin (1872–1933)

CALVIN COOLIDGE, the self-effacing governor of Massachusetts, was elected vice president under Warren Harding in 1920. The Harding administration moved into the White House at the beginning of Prohibition, and was plagued by scandals, many still unresolved when Harding died in San Francisco at the end of a presidential tour to Alaska in the summer of 1923.

Whereas Harding had been the choice of the Republican Party bosses and Senate leaders, Coolidge won popular support from the floor of the Republican convention, despite party leaders. To the rank and file delegates, Coolidge seemed an honest, decent, intelligent-minded, and even energetic governor who had few connections with the "smoke-filled rooms and fat cat bankrolls" But in an age of machine politics, Coolidge himself had risen to prominence in Massachusetts under the aegis of the Massachusetts Republican machine. He later prided himself on being "unbought and unbossed." Harding had brought Ohio cronies to Washington, D.C. including his political mentor, party boss Harry Daugherty, whom Harding appointed attorney general. In the midst of Prohibition, alcohol-fueled White House poker evenings were notorious. Corruption brewed in Daugherty's Department of Justice, the Bureau of Investigation, and the Treasury Department.

Charles R. Forbes, director of the Veterans Bureau under Harding, had been caught selling sup-

plies, worth hundreds of millions of dollars, that the government had allocated for the military and veterans' hospitals to private contractors. Harding allowed Forbes to leave the country to escape prosecution, but his general counsel at the Veterans Bureau, Charles Cranmer committed suicide while under investigation, as did Jess Smith, a key member of the Ohio gang and assistant and roommate to Harding's long-time friend, Attorney General Daugherty, after Harding discovered evidence that he had been engaged in influence peddling.

In addition, there were the lingering effects of the Teapot Dome scandal, which focused on Harding's secretary of the interior, former New Mexico Senator Albert B. Fall. The new president appointed two special counsels to investigate the Teapot Dome scandal. Fall was accused of leasing Naval Petroleum Reserves in California and at Teapot Dome, Wyoming, to oilmen Harry Sinclair and Edward Doheny, receiving \$400,000 dollars in return. Prior to the complete unraveling, Fall had gone through what became a common revolving door to a highly paid position with Sinclair's oil company.

Realizing that most of the scandals emerged from the office of the attorney general, Coolidge moved carefully, but finally found an excuse to have Daugherty resign when he refused to provide Justice Department documents requested by a Congressional investigating committee. Thus, through deft political maneuvering, Coolidge had largely defused the Harding scandals in time for the presidential campaign of 1924. Fall, finally convicted of bribery, went to jail, as did Forbes (who had returned to face his own investigation and prosecution). Daugherty was formally censured by the Senate, although his criminal involvement was never conclusive.

Coolidge was nominated to the Republican ticket on his own account, and was easily elected in a three-way race with Democrat John W. Davis and Robert M. La Follette running as a Progressive. Americans were satisfied with Coolidge's pledge of a "return to normalcy."

During his second term, Coolidge presided over a period of rising stock markets and seemingly rising prosperity. He was not a bold man, and this fit his philosophy of limited government interference. He strenuously resisted providing federal relief following the devastating floods on the Mississippi in 1927, which had left 1.5 million people homeless. He reasoned that the Congressional bill provided too

much support to “the railroads and the banks and the individuals that might have invested in levee bonds.” Coolidge continued to resist but finally acquiesced to the creation of what is now the Federal Emergency Management Administration (FEMA), and an important role for the U.S. Army Corps of Engineers in future flood control projects. All in all, it was not what Coolidge did, but what he failed to do, which branded him as a friend of business. He curbed the Federal Trade Commission with pro-business appointments. Under his administration, the hard-fought-for Interstate Commerce Commission languished. His efforts to lower taxes focused on reducing the burden on business and capital, relying on his multi-millionaire Treasury Secretary Andrew Mellon, an industrialist. The final bill actually increased corporate tax rates, but eliminated the gift tax and halved the estate tax.

Coolidge announced that he would not seek another term. As he left office, *The Nation* wrote: “To the businessmen who wanted a moratorium on reform and newfangled ideas and wished to get the government out of business, he has been a god-send.” The author continued to accuse him of “complete surrender of the regulatory powers of the government to the interests to be regulated.”

## copyright infringement

A FORM of intellectual property theft, copyright infringement occurs when one party copies another party’s copyrighted material without first obtaining permission. Major challenges for those seeking to enforce laws protecting copyright holders extend from the fact that laws have, over time, become insufficient for conviction within the new global envi-

ronment. Further, the penalties have typically been proven to be an insufficient means of deterring would-be violators. According to legal scholars, (Barr, et al.) this form of intellectual property theft has become so common that civil damages are considered part of the cost of doing business.

Copyright violators pose significant costs to rights holders by cheapening the cost of their product on the open market. Those seeking to hold violators of the law accountable have often encountered challenges posed by questions surrounding the types of material that may be copyrighted, and the flexibility of how illicit use of another’s material is defined. Rapid technological advances and widespread internet usage have introduced new dilemmas for parties seeking to impose penalties upon violators of copyright laws. Recent legislative changes have resulted in a broader definition of material that may be copyrighted, a broader interpretation of infringement, and the introduction of stricter penalties for violating the law.

### COPYRIGHT CRACKDOWN

In the early 2000s, there has been an intense escalation in efforts to crackdown on copyright infringement. However, as the U.S. Constitution granted Congress power over copyright legislation, it attests that this is not a new problem: 1897 marks the year when criminal copyright infringement, as separate from a civil violation, was first introduced into federal law.

Legal scholars (Barr, et al.) detail the evolution of copyright infringement laws and corresponding defensive and offensive strategies used in criminal cases. Conviction on the grounds of criminal infringement is contingent upon the prosecutor’s ability to show that the defendant willfully violated the law and did so for profit. The Copyright Act of 1976 eased the burden on the prosecutor by requiring that she prove that the infringement had been willful and undertaken for “commercial advantage” or “private financial gain” rather than “for profit” alone. Congress increased the penalties for criminal infringement in 1982. In 1992, Congress enacted the Copyright Felony Act in response to mounting complaints extending from piracy of computer software.

This was not the first time that Congress had legislated within the area of copyright infringement due to software piracy. The Copyright Act of 1976

was amended in 1980 to extend protection to software. Yet, software piracy continued to become increasingly widespread, posing difficult challenges to enforcement, and cut into the profits of manufacturers. Scholars who approach this issue from a sociological perspective explain that many people who copy and distribute software are unaware that they are even engaging in an illegal activity. Much of the confusion of what constitutes an illegal use of software lies in the fact that distributors themselves have passed on free trial copies to potential buyers.

The hypothetical scenario that sociologists Anne Christensen and Martha M. Eining present in their study is all too real and familiar. An office worker makes copies of a program licensed for only one computer in her workplace so that she may use it at home to increase her own efficiency. Copies are also passed on to his friends. However, under licensing agreements, the software company actually retains ownership and therefore the right to limit subsequent duplication. Users agree to this arrangement when they open the package and accept the terms when they install the software package on their computers.

Thus, the 1992 Copyright Felony Act broadened protection beyond copyrighted audiovisual materials to include all copyrighted works and lowered the monetary threshold required to bring a criminal, rather than a civil, conviction. In order to achieve a criminal conviction, the burden falls upon the prosecutor to prove the existence of four elements were at work at the time of the defendant's alleged violation of copyright laws. First, that a valid copyright exists must be established.

A copyright is valid only if a certificate of registration has been issued within 5 years of the first appearance of the work. Second, it must be shown that the defendant has access to the work in question and that the copy is substantially similar. The challenge posed here lies in the standards that are used to establish what constitutes substantial similarity. Courts apply different standards in this regard, with some comparing the replicated version in its entirety against the original, and others that separate the copyright-protected components from unprotected components.

Third, the prosecution must show that the defendant intended to violate the law. And finally, it must be shown that the violation was for financial gain or violated the minimum threshold. A threshold violation is established if it can be shown that

the value of the total amount of goods copied and distributed is in excess of \$1,000.

The defense of the accused party is contingent upon ability to establish "first sale," "fair use," or "*scenes a faire*." First sale doctrine asserts that the author of any copyrighted material relinquishes control over subsequent distribution once the first sale of the product has been made. However, first sale does not recognize the right of the purchaser to reproduce and distribute additional copies. This defense is most successfully applied, however, in cases where copies have been imported into the United States.

The establishment of fair use is more vague because the defense must balance the underlying "good" intentions for the reproduction and distribution of copyrighted material against the overall harm that has been done. Questions of whether or not the material was used for educational or non-profit purposes may be examined to determine fair use. *Scenes a faire* may be argued when it can be established that the material in question is so integral to the production of a work falling into a particular category, that no works may be produced without using that same element.

## BREACH OF ETHICS

Copyright infringement represents a breach of ethics through the impact that it has on the community, broadly defined. Copyrighted material represents the intellectual property, often of an individual developer who does not reap the full value of her product through sales on the open market. It has been argued that the savings that accrue to copyright violators are passed on to consumers making legitimate purchases by vendors who estimate the costs of pirated material. Pirated products, such as software, cannot be updated. Entities providing services that are contingent upon pirated products therefore place clients at risk. Individuals using pirated materials within a business environment expose the company as a whole to legal action.

## INTERNET FILE SHARING

Cases of copyright infringement that have captured media attention involve suits brought by the recording industry against internet file-sharers, and a rise in the incidence of publishers suing copy shops lo-

cated near the campuses of major universities. The recording industry filed 261 lawsuits against consumers who shared music over the internet. File-sharing networks, such as Napster, allowed millions of people to trade and download files of copyrighted music free of charge. The magnitude of internet file-sharing poses a threat to recording companies that lose the competitive advantage they have enjoyed over production and distribution.

In an unprecedented move, the recording industry decided to sue a sample of people who had made 1,000 songs or more accessible in folders housed on major file-sharing services. This move represents an effort to stigmatize an activity that an estimated 60 million Americans engage in by labeling it as a criminal activity. It is a strong message to the public. However, it has been pointed out that the recording industry risks alienating the public; increasingly, unmasked offenders have been teens and college students.

In 2003, a crackdown focused on businesses that copy and sell course-packs to college students without first getting permission from publishers. Copy shops in both Los Angeles, California, and Indiana number among those sued in a lawsuit coordinated by the Copyright Clearance Center for copying journal articles and excerpts from books, and then selling the compiled packet without obtaining permission and without paying royalties for that privilege.

## corporate criminal liability

THE CORE QUESTION is this: Can a corporation commit a crime? Some insist that the answer should be no. They argue that a corporation is an inanimate entity. It has no mind, no will, and no power to act except through the behavior of people who are in charge of it and those who work for it.

But the answer in the law that prevails in the United States is yes. A corporation may be convicted in a criminal court for acts that violate the penal law of the jurisdiction in which it is tried. The guilty corporation may be punished in a variety of ways: it can be made to surrender the license that allows it to carry on its business; it can be forced into bankruptcy; it can be placed on probation, and, as happens much more usually, it can be fined. The crimes that a corporation may commit include murder as well as offenses of omission, such as the failure to install safety precautions in a factory. A corporation presumably cannot be convicted for rape, and it cannot be imprisoned.

The current legal rules regarding corporate criminal liability came into being after earlier debate about the propriety of criminally punishing a corporate entity. A major argument was that a corporation lacked the required *mens rea* (that is, a guilty mind) that is usually essential for a determination of criminal guilt. John Marshall, an early chief justice of the U.S. Supreme Court, noted that a corporation is "invisible, intangible, and existing only in the contemplation of law."

But arguments opposing inflicting criminal liability on corporations fell piecemeal over the years. Probably the most significant reason was that corporations were more readily identifiable than the humans within them who might have been responsible for criminal behavior. Second, the economic power accumulated by the corporate world seemed to demand that reins be imposed on it to restrain free-wheeling and destructive acts. Also, not insignificantly, corporations typically have deep pockets, that is, a good deal of money from which the state, by means of criminal convictions, can obtain recompense for financial or other harm or costs inflicted by corporate wrongdoing.

#### HISTORY OF LIABILITY

The principle that a corporation can be accountable for the crimes of its agents arose in church courts in

medieval times. The church responded to alleged heresy in corporate bodies, most notably monasteries, by excommunicating them. In the 13th century, however, Pope Innocent IV reversed that trend on the theological ground that church organizations did not possess a soul: they were *persona ficta*, that is, fictitious persons.

In England, financial responsibility first came to be placed on boroughs, regarded as corporate entities since they were chartered by the king, for such matters as failure to keep a bridge in repair.

American courts first placed corporations into a criminal law context in the 1908 *New York Central Railroad* case (212 U.S. 481), an occurrence duplicated in England not long after in *Moussell Brothers* (2 King's Bench 836). In time, the federal legal system and all of the American states came to regard corporations as fair game for criminal prosecution.

Foreign jurisdictions deemed it legally impermissible to charge a corporation under the criminal law until much more recently, but they too increasingly have been falling in line with the Anglo-American doctrine. In 1998, for instance, the Council of Europe recommended that members should consider changing their criminal codes to include corporate criminal liability, and that they should attach four elements to their definition of the offense: 1) the offender's act should be related to his or her employment; 2) liability should attach even if the person who committed the criminal act cannot be identified; 3) the enterprise can be exonerated if "all necessary steps" had been taken to inhibit the behavior; and 4) corporate criminal liability should be imposed in addition to individual criminal liability.

Some scholars believe that the idea of corporate criminal liability was sloppily superimposed on a structure of criminal law that had been built with human behavior in mind, and that a distinctive body of law ought to be established that deals exclusively with corporate wrongdoing. But such a change is unlikely unless a particularly striking situation develops that highlights the inadequacy of the jerry-built laws and court decisions that define corporate criminal liability today.

It is uncertain whether the laws proscribing various forms of activity that are charged against corporations as crimes are effective in preventing such behavior. Research conducted on this subject remains woefully weak. Sally Simpson has observed that the question has never been explored with the use of satisfactory scientific approaches and that

the conclusions that have been published are far from reliable as guides to policy.

The U.S. Sentencing Commission provided the most important recent additions to the debate about corporate criminal liability when it issued guidelines for the judicial disposition of convicted corporate criminals. Penalties were made much stiffer, although the commission was forced by industry lobbyists to back down from its initial attempt to impose even tougher sentences. Penalties under the guidelines may be reduced by cooperation with the enforcement agencies and by demonstration of programs aimed to head off an offense before it occurs. Such mitigation, however, is not permitted if the crime was committed by a senior employee with managerial authority.

A 1995 report indicated that all but a few of the companies sentenced under the new guidelines had been in business 10 or fewer years, and that 97 percent were privately held or controlled by a small group of shareholders. It may be that the debate on corporate criminal liability, which tends to visualize the culprits as being the large and powerful Fortune 500 organizations, is dealing with an issue that is far from the reality of what actually happens. The recent outbreak of cases involving giant corporate business, exemplified by the Enron and Arthur Andersen scandals, may herald a shift in enforcement priorities.

## LIABILITY DEBATES

In the precincts of criminological social science, the major intellectual dispute concerns attempts to construct theoretical explanations for corporate criminal liability. A debate between Donald Cressey, who declared that such explanations are impossible, and John Braithwaite and Brent Fisse, who argued the opposite viewpoint, ended in what many non-combatants considered a draw.

Cressey maintained that it is self-defeating to try to apply social psychological theorizing to corporations because such work "is based on the erroneous assumption that organizations think and act, thus saddling theoretical criminologists with the impossible task of finding the cause of crimes committed by fictitious persons."

"It is time," Cressey insisted, "for criminologists to put their common sense to work when confronting reports that a corporation or other organization has committed a crime." He grants

that it is possible to locate correlations between structural variables, such as a corporation's financial condition and its involvement in criminal actions, but he argues that it is not possible to go beyond such statistical relationships to statements regarding causation.

For Braithwaite and Fisse, a theory need not depend upon what they call "moral personhood," that is, on human beings acting as individuals. They note that the Great Depression can be explained theoretically without any need to find humans who might be said to have caused it. The essence of the Braithwaite-Fisse position is that what corporations do is a composite of individual actions and can be sensibly interpreted as an additive process, exemplified, for instance, by corporate documents. A corporation may engage in a criminal act that no single individual in the organization would personally endorse but which, as a group, employees actually or passively allowed to take place. The analogy is to a lynching mob that carries out acts that no member of the crowd would do alone.

The development of the doctrine of corporate criminal liability has been the result almost totally of expedience rather than reliance on sound empirical information. This is not to say that what has resulted is necessarily wrong or ought to be jettisoned, though many believe otherwise. It is to say that the concept of corporate criminal liability has not been accorded sufficient research attention that could resolve nagging and very important issues. We do not surely know, for example, whether charging a corporation rather than an individual or charging both together dilutes the deterrent force of the penalty or makes no difference. Often prosecutors will ease up on individuals if their corporate employer admits guilt and provides information that could aid in a civil suit by those who were exploited. Is that a good or a self-defeating tactic in regard to deterrence of the wrongdoer and those who might contemplate doing the same thing or another corporate crime? These are matters that await attention by those concerned about the concept of corporate criminal liability.

## corporate dumping

THE PRESENCE of various types of toxic substances in our environment has become increasingly widespread—a fact that former President Jimmy Carter once called "one of the grimmest discoveries of the modern era." Chemical sales in the United States exceed a \$112 billion per year, with as many as 70,000 chemical substances used in commerce. There is no clear-cut definition of what a hazardous waste crime includes, but one definition of a hazardous waste crime is: any act that violates a hazardous waste statute.

The Resource Conservation and Recovery Act (RCRA) of 1976 is the main statute that outlines the various types of activities that are regulated and punishable. Under RCRA, the Environmental Protection Agency (EPA) has defined hazardous waste as any solid waste, or combination of solid wastes, that because of its quantity, concentration, or physical, chemical or infectious characteristics may: cause, or significantly contribute to an increase in mortality or an increase in serious, irreversible or incapacitating reversible illness; or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported or disposed of, or otherwise managed. (42 U.S.C. '6903 (1983 ed., supp. 1991).

While hazardous waste crimes vary according to local industry or population type, similar methods of operation are used regardless of the type of waste or material involved. One widespread practice involves criminal activity by a generator, transporter, broker, or treatment, storage, and disposal facility. For example, a generator may act alone or conspire with others to illegally dispose hazardous waste, either by on-site disposal or by removal and disposal at unauthorized points. Often, an unlicensed transporter will contact unwitting (or uneducated) generators and convince them that a low-cost disposal strategy is possible. The transporter may conspire with a known treatment, storage, and disposal facility or dispose of the wastes after falsifying the manifests. A less common practice, but one seen in several states, is to rent a truck, fill it with hazardous waste, and then abandon the vehicle.

Perhaps the most common form of illegal disposal of hazardous waste is midnight dumping. In a typical midnight dumping scenario, wastes are disposed of in the nearest isolated area. Agents of generating companies can directly commit these offenses or criminally conspire with waste transporters or treaters who, for a percentage of the legitimate treatment cost, will illegally dump the wastes. In some instances hazardous waste generators are the victims of fraud committed by midnight dumpers; payment is rendered by the generator to the treater for services that are never performed.

### COCKTAILING

Three other common types of hazardous waste crimes include cocktailing, paying illegal tipping fees, and the forging of manifests. Cocktailing occurs when someone mixes hazardous waste with nonhazardous waste in small quantities so that it will pass for a nonhazardous waste. Once the hazardous waste is mixed in 55-gallon drums, county and state landfills should not accept the waste, but many landfills have been caught accepting the waste if the transporter pays the landfill employee a tipping fee to look the other way and/or classify the incoming waste as non-hazardous.

Every shipment of hazardous waste must be accompanied by a manifest. Forging manifests is also common and is mainly done either by the generator or the transporter. Transporters may illegally dispose of some of the waste, then change the amount

of hazardous waste that is shown as properly disposed of on the manifest. This practice allows the generators to have a copy of a legal manifest to show to the regulators while giving the transporters more money because the difference is made up by the illegal disposal of some of the waste.

### EXTENT OF WASTE CRIME

Estimating the extent of hazardous waste crime is conceptually and practically very difficult. To begin, national estimates of hazardous waste generation are highly uncertain. A second obstacle is the various and conflicting definitions of hazardous waste that exist between the federal, state, and local level environmental agencies. Not only are there varying definitions, but there are new chemicals being produced each year that may or may not be considered hazardous according to the different standards. A third obstacle to obtaining accurate estimates of hazardous waste generation is the difficulty in identifying the universe of hazardous waste generators, treatment, storage and disposal facilities, and those who transport the waste.

As of 2003, the EPA estimated that there were 302,283 known organizations handling hazardous waste in America. This does not include many of the small organizations that have not been identified, including the thousands of hazardous-waste producing auto repair shops, dry cleaners, and photo-processing businesses operating in the United States. The major problem of illegal hazardous waste handling and disposal is suggested to be worse among these smaller nonregistered organizations. Lastly, it is also hard to estimate the actual amount of illegally disposed hazardous waste since there are numerous places to dump it without discovery. Even if the illegally disposed hazardous waste is found, it is nearly impossible to identify how, when, and by whom it was dumped. In order to stop the illegal disposal of hazardous waste, it is imperative to understand who is responsible and what motivates the offender(s).

Who are the perpetrators of these crimes? This is a good question, but unfortunately one that has not been subject to much research. There are different types of hazardous waste criminals, and their methods of operation can be very different as well. There are also a variety of reasons why people commit hazardous waste crime. Some people may accidentally, negligently, or unknowingly violate a

hazardous waste law. Others may face a financial crisis in their businesses and be motivated to reduce their operating costs by illegally disposing of their waste. Basic greed is another motivator, and some may intentionally plan to pollute for profit. Some hazardous waste criminals are even business associates or members of organized crime.

It is much easier to identify the victims of hazardous waste crime than the perpetrators, but even this can be extremely complicated. America's vast industrialization has resulted in enormous quantities of all sorts of waste. Hazardous wastes crimes have the potential to cause serious harm to both the public and the environment.

Since the discovery of the infamous Love Canal hazardous waste dump site in the 1970s, the problem and study of hazardous waste has received a great deal of attention by the public and the media. This attention has mostly focused on the possible health effects the illegally disposed waste has had on human life. An estimated 100 billion tons of hazardous waste are produced in the United States, with a majority of it being disposed of in an unsound manner.

## THE HUMAN COST

It is very difficult to estimate the human costs of illegal behavior against the environment. Not only is it hard to find the exact cause of environmentally related health problems, but the ultimate source of existing pollutants can be just as difficult to identify. The common absence of a "smoking gun" in hazardous waste cases complicates the task for prosecutors. While the immediate, short-term effects of hazardous waste crime are often hard to detect, the long-term damage can be very severe. Illegally disposed hazardous wastes can cause serious harm to the environment and human health through contamination of water, air pollution, fires and explosions, poisoning via food chain contamination, and direct human contact.

Hazardous waste pollution has deadly consequences. The dumping of hazardous wastes in lakes, rivers, and streams has a significant effect on the aquatic life residing there. One example of a catastrophic "accidental" disposal of waste occurred in Spruce Creek, Pennsylvania. A pipe from a cattle barn leading to a large manure storage lagoon burst. The contents, high in ammonia, poured into a feeder stream that led to Spruce Creek and killed

approximately 11,640 fish. Contamination of fish can directly impact people. Due to heavily polluted waters in many areas across the United States, citizens have been warned not to eat any of the fish drawn from the polluted waterways.

One of the worst cases of illegal dumping involves a Hooker Chemical plant operating in White Lake, Michigan. Hooker was dumping barrels of hazardous chemicals on company property, which apparently leaked into White Lake, killing scores of fish. During the investigation, 20,000 barrels of toxic chemicals were found. White Lake was found so contaminated that residents were warned not to eat the fish or drink the water. In fact, many of the residents suffered birth defects, sterility, and cancer.

This, by no means, is an isolated incident. There are parts of the United States that are so well known for their high level of hazardous waste contamination that they have been given nicknames like "Cancer Alley."

## corporate raiding

CORPORATE RAIDING refers to two different types of behavior. The first is the situation in which

a company hires away employees of interest from a competing company. Typically, the hiring company is interested in the knowledge and proprietary information that the employee has about the products, and/or financial situation of the company they are leaving. For example, Company A is a software development company, which approaches Mr. G who is a software writer for Company B, a competing software development firm. Company A agrees to pay Mr. G twice his salary at company B if he will move his projects to Company A. While not criminally illegal, this type of corporate raiding may be considered immoral or unethical, as well as civilly liable behavior. News reports suggest that this type of corporate raiding is becoming more common as companies seek newer and better products to boost lagging corporate profits.

The second type of corporate raiding was very popular in the 1980s and 1990s era of corporate mergers and acquisitions. This type of corporate raiding involved investors buying controlling interest in corporations. The raid could constitute a friendly takeover, in which the officers and board of the raided corporation agreed to the merger. The other type of raid was called a hostile takeover, in which the officers and board of the raided corporation would fight the takeover.

## corruption

THE GREEK PHILOSOPHER Plato (427–347 B.C.E.) believed that democracies were the "fairest" and "most beautiful" of all forms of constitutional government. However, as discussed at length in his classic work, *The Republic*, Plato also believed that a government ruled by the people would ultimately break down, because jealousy over one another's respective functions within the society, and improper decision making by an uneducated public would

yield chaos, subsequently giving way to a desire for order and stability achievable only through despotism. Similarly, the Roman historian Polybius (c. 200–118 B.C.E.) noted that the "... desire for luxury, bribery for the sake of political power, and the substitution of eagerness for wealth ..." in lieu of wise governance, results in corruption. For our purposes, corruption can be defined as wrongfully using one's influence to procure some benefit for oneself or another person.

Both Plato and Polybius saw corruption as inevitable in nearly every form of constitutional system. Polybius produced a number of important writings pertaining to mixed constitutional forms of governance in an effort to curtail corruption. In fact, history scholar Marshall Davies Lloyd, in his article, "Polybius and the Founding Fathers: the Separation of Powers," goes so far as to attribute America's system of checks and balances (that is, executive, legislative, and judicial branches) to Polybius' works. Yet Plato and Polybius also espouse a certain order to life, and corruption is merely an accepted part of it.

The beliefs of these ancient Greek and Roman scholars are comparable to the values shared in many other cultures. For example, bribery has long been accepted in India as a way of life. In April 2002, a law enforcement officer in Punjab sought to secure a government position for his daughter—hoping that placing her in this job would give him access to increased levels of graft. He attempted to coax the officials who recorded the entrance exam scores into raising her final grade by providing them with a \$100,000 bribe.

Unfortunately (for the police officer and his daughter), he attempted to pay the exam administrators with counterfeit currency and was subsequently arrested. Another example is Mexico, where the public frequently provides government officials with *mordida*—which literally translates into English as "the bite," but more accurately refers to a bribe.

Even within the United States, the "honest graft" era of Boss Tweed and Tammany Hall, in which \$75 to \$200 million was swindled from New York City between 1865 and 1871, or the mayoralty of Boston's James Michael Curley, who was able to build a 17-room home complete with a mahogany stairway and crystal chandelier on a small public servant's salary, are spoken of to this day with a form of renegade reverence.

## THE EARLY REFORMERS

Offenses such as bribery, receiving kickbacks, or exerting undue influence over others have likely existed throughout recorded history. Such acts are not exclusive to Europe, Asia, and the developing nations of the world. More than 100 years ago, many activists within the United States, particularly those who had been previously involved with the Abolitionist movement of the Civil War era began to call for the reformation of government policies and procedures in the areas of public employment, code enforcement, and education.

Joseph Rue's "comparative study of spelling performance by 33,000 students in 1897" was at least, in part, an effort to assess the effectiveness of those employed as public school teachers. The ranks of the public service, including those persons employed in education, engineering, law enforcement, and public health were rife with employees lacking legitimate qualifications or simply functioning as a conduit for graft. Thus was born what authors Frank Anechiarico and James B. Jacobs refer to as the anti-patronage vision of corruption control. Through the development of a merit-based civil service system, the reformers hoped to curtail the spoils system that had become pervasive in public-employee hiring, particularly at the local level.

Prior to the passage of the Federal Civil Service Act of 1883, it was not uncommon for city jobs to be awarded in exchange for cash, gifts, or rendering other services at the ward or district level. New York's subsequent implementation of a civil service program—the first such system in the nation—was designed to provide a mechanism through which "comparative merit or achievement [would govern] each individual's selection and progress in the service, and in which the conditions and rewards of performance contribute to the competency and continuity of the service," explain authors Frank Anechiarico and James B. Jacobs.

Such a system was also desirable because many of those persons employed as safety monitors for food products and medicines had failed to adequately protect public health. Upton Sinclair, an author and social activist wrote his 1904 book, *The Jungle*, about rampant abuses in the meat-processing industry.

Borne from the anti-patronage movement was the establishment of a Progressive vision of corruption control within the United States. Spanning

from approximately 1900 to 1933, the focus of the Progressive movement was to separate public administration from party politics, and to protect the masses from corporate abuses by restoring public trust in those acting in positions of power. One of the earliest reformers was Theodore Roosevelt. During Roosevelt's term as president of the United States (1901-08), he strived to eliminate the spoils system that had become pervasive in public office and to reintroduce competition into the marketplace. In 1903, he tasked Congress with the formation of a Department of Commerce and Labor and a Bureau of Corporations to protect the public against unscrupulous business practices.

In 1906, in response to Sinclair's concerns about the safety of America's meat supply documented in *The Jungle*, coupled with issues pertaining to the quality of drugs being manufactured, and the highly exaggerated claims proffered by the producers of health tonics, salves, and potions, Congress enacted the Pure Food and Drug Act. This act specified that any meat products sold in interstate commerce had to be inspected by federal regulators. Roosevelt's enforcement of the Sherman Antitrust Act against the major railroad operators, United States Steel Corporation, and Standard Oil Company yielded victories for the American public both in terms of value and choice of services.

Succeeding Roosevelt, President William Howard Taft continued to strive for reduced corporate influence in government and fair market competition, resulting in more than 80 antitrust actions being filed during his tenure. Most notably, in 1911, American tobacco was deemed to be a monopoly. Later that same year, "the court ruled that John D. Rockefeller's Standard Oil should be broken up into 33 companies," author Kathryn Rubenstein notes.

Immediately following Taft, President Woodrow Wilson continued the fight to curtail the links between private entities and government policies. Among Wilson's greatest successes was the passage of the Federal Trade Commission Act of September 26, 1914. The act established the Federal Trade Commission, which was comprised of five commissioners—not more than three of whom could be from the same political party. The terms of office for each commissioner were also staggered, thus reducing the likelihood of widespread political influence. Commissioners were prohibited from being involved in any other corporation or busi-

ness. The United States's subsequent foray into World War I brought Wilson new challenges, among them were efforts to curtail corruption in the wartime economy.

Unfortunately, progress in corruption control present during the administrations of presidents Roosevelt, Taft, and Wilson came to a grinding halt during the sordid term of Warren G. Harding (1921–23) and the tepid tenure of Calvin “Silent Cal” Coolidge (1923–29). Harding was an ardent supporter of big business. His campaign promise of “less government in business and more business in government” coupled with his entourage referred to as the Ohio gang—a large number of who were ultimately incarcerated—did not reflect positively on the presidency. Harding was also implicated in two sex scandals. The first involved Carrie Phillips, a German sympathizer during the World War I who attempted to blackmail the president. The second incident involved Nan Britton, 30 years younger than Harding, who alleged that they had conceived an illegitimate child together in a closet of the U.S. Senate prior to Harding's run for the presidency in 1920. Yet it was Harding's connection to the infamous Teapot Dome scandal for which he is best remembered in the annals of government corruption.

#### EFFORTS AT CORRUPTION CONTROL

In 1921, Albert B. Fall, Harding's secretary of the interior, successfully lobbied Secretary of the Navy Edwin Denby to turn over control of the nation's government-owned oil reserves to him. In exchange for \$400,000 in personal compensation, Fall then surreptitiously set up leases with the Mammoth Oil Company owned by Harry Sinclair and Edward Doheny's Pan American Petroleum Company.

Shortly thereafter, Fall's new lavish lifestyle came under public scrutiny. A subsequent investigation yielded lawsuits against the government for illegally obtained contracts. In 1927, “the Supreme Court ruled that the oil leases had been corruptly obtained and invalidated the Elk Hills lease in February of that year and the Teapot Dome lease in October of that same year,” Jimmy Zeck explains. Management of the oil reserves was again returned to the Department of the Navy. In 1929, Fall was found guilty of bribery and sentenced to one year in prison and a \$100,000 fine. Sinclair received a short jail sentence for contempt of court and obstruction of justice. Doheny was acquitted of

bribery charges in 1930. Despite the fact that Harding was never linked financially to the scandal, the incident seriously damaged his ability to effectively govern, and impugned his character and personal integrity even after vacating the presidency.

Succeeding Harding, Coolidge was forced to carry the political baggage of scandals that rocked the former office of the chief executive. When he finally managed to shed off some of the stigma of the Harding administration, Coolidge's efforts at policymaking were heavily geared toward the reduction of taxes and empowerment of business. The majority of Coolidge's appointees did little to bridge the gap between corporate wealth and government corruption. Overproduction of foodstuffs and commodities, overexpansion of credit and soaring levels of personal and corporate debt, coupled with Coolidge's “say nothing” approach to governance ultimately led to an economy on the verge of collapse.

Opting not to run for re-election in 1928, Coolidge bestowed upon Herbert Hoover an unenviable place in American history—the opportunity to largely serve as the fall guy for the stock market crash of October 1929, and the worldwide Great Depression swirling around it. This is unfortunate because Hoover made several lasting and important contributions to corruption control. For example, Hoover served as the Food Administrator during World War I, and worked hard to curtail fraud and abuse in the distribution of foodstuffs, both within the United States and on the war front in Europe. He also served admirably as Harding's secretary of commerce, and called for an investigation of the banking industry, and tighter regulations on how funds could be invested.

Hoover created the Reconstruction Finance Corporation (RFC), which made loans to a variety of businesses and allowed for government scrutiny of the recipients. He reorganized the formerly corrupt Bureau of Investigation in 1924 into what ultimately became the Federal Bureau of Investigation (1935). Lastly, Hoover's establishment of the U.S. Bureau of Prisons helped to professionalize corrections-oriented occupations, ensure humane treatment of offenders, and curtail corruption in America's justice system.

Franklin D. Roosevelt's 1933 election as president of the United States ushered in dramatic changes in the way in which government operated—differences that can still be felt to this day from the

social reform policies emanating from his New Deal programs. Unlike the staunchly pro-business policies of the Harding and Coolidge administrations, or the more *laissez-faire*, or hands-off economic approach touted by his predecessor, Hoover, Roosevelt enacted "... an unprecedented program of government-industry cooperation ..." historian George Burson explains. Yet Roosevelt was much less a progressive than his fifth cousin and former president, Theodore Roosevelt. He saw his mandate within the New Deal to energize private enterprise, and worked to pass a myriad of legislation. Roosevelt's expansion and restructuring of the executive branch during the New Deal, coupled with the infusion of presidential activism created a tone that would remain part of American politics through the administrations of Harry S Truman, Dwight D. Eisenhower, John F. Kennedy, and Lyndon B. Johnson.

As the 1950s and 1960s progressed, and America's fascination with the space race and Cold War escalated, so too did the belief that social problems could be solved through scientific solutions. The Johnson administration's War on Poverty—part of the Great Society vision—was in many respects an extension of Roosevelt's New Deal. The War on Poverty created large-scale public programs in "... federal health, housing, employment, services integration, community planning, urban renewal, welfare, family programs ... [etc.]," explains author Michael Quinn Patton. Along with these new programs came Congressional mandates to evaluate the efficacy of appropriated expenditures. The U.S. General Accounting Office, which had previously focused predominantly on comprehensive accounting, also saw its role expanded to include more analytical and investigative activities.

#### RICHARD NIXON

From his earliest days as president, Richard M. Nixon sought to dismantle Johnson's Great Society vision, particularly the War on Poverty, which had burgeoned since its inception in 1964. His administration also sought to curb abuses in employee labor (for example, high-risk industries such as chemical manufacturing, electroplating, shipbuilding, and construction), which ultimately led to the enactment of the Occupational Safety and Health Act of 1970. The Nixon administration also engaged in some high-profile antitrust actions, includ-

ing *Ford Motor Company v. U.S.* (405 U.S. 596) in 1972, *U.S. v. Falstaff Brewing Company*—at the time the fourth largest brewery in America (410 U.S. 526), and pushed for curbing TV and radio advertising promoting cigarette use (1969) and requiring cigarette health warnings in print media (1972).

Ironically, the ultimate cause of Nixon's failure as president was probably his obsession with control. While he successfully enacted a host of laws and regulations aimed at monitoring the health, safety, and fiscal performance of corporations, he also "...sought, with little subtlety, to circumvent legislative constraint," J. D. Aberbach and B. A. Rockman explain in their book, *In the Web of Politics*.

For example, Nixon was unhappy with the non-partisan, civil service orientation of the Bureau of the Budget—an agency that had been specifically designed to serve as a resource available to the chief executive. In 1970, he restructured this organization into the Office of Management and Budget (OMB).

In doing so, Nixon dramatically altered the orientation of the Bureau of the Budget from a neutral support organization into a tool to be used by the president to monitor agencies in the executive branch and keep senior cabinet officials in check. The approach is consistent with the panoptic vision of corruption control, which relies on "a comprehensive system of administrative/criminal laws... enforced by law enforcement agencies using a full array of investigative tools, including covert operations," according to Anechiarico and Jacobs. Nixon masked his desire for a centralized, tightly controlled executive through a program that he dubbed the Quality of Life Review (QLR). Using his newly reorganized Office of Management and Budget, he was initially successful in keeping agency heads from leaking information on the administration's plans under threat of QLR review.

Nixon had hoped to make sweeping and powerful consolidations of federal law enforcement, investigative, and intelligence functions, and sought to curtail the activities of the Federal Bureau of Investigation to limit its investigative authority in matters pertaining to the Oval Office.

Ironically, the June 17, 1972 Democratic National Committee (DNC) Headquarters break-in (Watergate) perpetrated by members of Nixon's reelection committee actually resulted in a broadening of the FBI's powers to investigate misconduct on the part of senior elected officials, including the

president, and led to enacting the Independent Counsel Act in 1978.

## JIMMY CARTER

Without question, no president in U.S. history has done more to foster and expand the panoptic vision of corruption control (that is, left unchecked, government officials will engage in corrupt and illegal activities) than James Earl Carter, Jr. A former naval officer and agricultural businessman, Carter went on to serve as the governor of Georgia from 1971-75. During his tenure in this position, Carter implemented a financial management system referred to as zero-based budgeting, designed to require state program managers to justify each and every cent that would be expended on public projects (a modified form of zero-based budget was also used during the Carter presidency, but it met with such resistance from both executive branch managers and Congress that it was ultimately abandoned). He also enacted Georgia's first "sunshine" law, which allowed the public to participate in a variety of government meetings, particularly when policy issues were to be discussed.

Yet Carter's most pronounced reforms in public administration occurred in 1978, while he served as the 39th president of the United States. He advocated passage of the 1978 Civil Service Reform Act, which served a dual role as "enhanc[ing] the responsiveness of the higher civil service by allowing individuals to be transferred to other jobs ... to broaden their perspectives or to make better use of their talents ... [and] to provide incentives for recalcitrant or difficult individuals to leave the civil service," according to Aberbach and Rockman. The Civil Service Reform Act (CSRA) of 1978 also established a new tier of federal employees, referred to as the Senior Executive Service, designed to hold top executive branch agency managers and administrators "accountable for individual and organizational performance," explains the Office of Personnel Management.

Carter's belief in the panoptic vision of corruption control led to the passage of the Inspector General Act of 1978. Inspectors general (IGs), are non-partisan, independent managers who examine programs in which federal monies have been expended. Specifically, IGs are concerned with issues of waste, fraud, and abuse. Cabinet-level IGs are nominated by the president with the advice and

consent of the U.S. Senate. Inspectors general can also be appointed to serve at individual agencies within the executive branch. The head of the respective agency can make such appointments. Cabinet-level IGs can only be removed by the president.

To fulfill their responsibilities, each office of the inspector general retains criminal investigators, auditors, program analysts, information technology specialists, and support personnel. IG findings can be used in the criminal prosecution of corrupt officials, to assist agency heads or cabinet-level officials in determining if an employee disciplinary action is warranted, and to aid Congress in determining future funding for executive branch programs based on their relative effectiveness and efficiency. In order to enhance the likelihood that incidents of waste, fraud, and abuse will be reported to IG Offices, both the 1978 Civil Service Reform Act and the Inspector General Act include whistleblower protection provisions for those employees who report illicit activities. Whistleblower protections for federal workers and government contractors were further enhanced in 1989 and 1994, when the definition of reportable activities was broadened, and remedies for reprisal against whistleblowers were expanded.

The Office of the Special Counsel (OSC), which is also an independent federal investigative and prosecutorial agency, further protects workers from reprisal if they have reported acts of waste, fraud, and abuse. One of the most important facets of the Inspector General Act was that its authority applied not only to federal agencies, but also to the myriad of programs funded with federal monies. Accordingly, state and municipal projects funded through government grants also began to see the influence of Carter's policies, including audits and investigations conducted by the federal inspectors general, largely in the areas of housing, health and human services, education, and environmental protection.

## THE REAGAN-BUSH YEARS

In the slightly more than 100 years that America has wrestled with various corruption control strategies (that is, anti-patronage, progressive, scientific administration, and panoptic) no period was as wanting of efforts to curtail such acts as the 12 years that Ronald Reagan and George H. W. Bush served as chief executives. The Reagan and Bush administra-

tions were rife with scandals, and correspondingly deficient in their efforts to combat them. Summarizing the research of Shelley Ross in their 1998 book, *White-Collar Deviance*, authors David R. Simon and Frank E. Hagan conclude the following about the Reagan years: “Between 1980-88 over 200 Reaganites came under either ethical or criminal investigation, the greatest number of scandals in any administration in American history.” Scholars Stephen M. Rosoff, Henry N. Pontell, and Robert Tillman keenly observe that “one of President Carter’s last official acts was the issuance of an executive order toughening the notification requirements for companies wishing to export products whose use is restricted in the United States. One of President Reagan’s first official acts was the immediate revocation of the month-old Carter order.”

From Iran-Contra to Wedtech, to the collapse of the Bank of Credit and Commerce International (BCCI), and the savings and loan scandals, neither Reagan nor Bush effectively developed any significant corruption control policies. Like Nixon, Reagan used the Office of Management and Budget (OMB) as both carrot and stick to reward loyal administrators with substantial budgets, and punish those who disagreed with his policies by requiring that their agencies perform comprehensive cost-benefit analyses and functional program reviews to the satisfaction of OMB.

In many ways, the first Bush administration was more ambivalent than the Reagan White House. Bush complained publicly about being chided for lacking “that vision thing.” Were this not enough of a challenge, a soft, but steady rumbling of questions began to emerge about Bush’s three sons. John Ellis “Jeb” Bush of Florida had defaulted on a \$4.6 million loan from the Broward Savings and Loan, and both of his business partners had been involved in other savings and loan misuse schemes. Neil Bush, the director of the Silverado Savings & Loan, had made a series of bad loans in excess of \$100 million to two of his business partners. Ultimately, the Denver-based savings and loan failed, and the fall-out cost U.S. taxpayers more than \$1.3 billion. Lastly, in 1984, George W. Bush had managed to merge his failed Arbusto Limited with the Spectrum 7 Energy Corporation.

Ultimately, the company was blended into Harken Energy Corporation in 1986, and George W. Bush was given 212,000 shares of stock and a directorship with the Dallas-based corporation.

George W. Bush cashed out his stock at a 250-percent profit just weeks before severe corporate losses were announced.

#### “REINVENTING GOVERNMENT”

Many people equate corruption with President William J. Clinton. After all, there were such events as the Monica Lewinsky scandal, Whitewater, Travelgate, the Democratic National Committee donations, the Lincoln Bedroom debacle, and appointing Hillary Clinton as “Healthcare Czar.” In reality however, for all of the millions of dollars spent investigating these incidents, little actually came of them. Clinton did perjure himself for which he was ultimately fined and disbarred in Arkansas (similarly Nixon was disbarred in New York and former Vice-President Spiro Agnew lost his law license in Maryland); he did engage in “sexual relations” with Lewinsky—although he was not intimate with a German sympathizer during wartime nor did he allegedly sire a child in the Senate cloakroom as Harding had purportedly done) and Independent Counsel Robert Ray found insufficient evidence existed to support allegations that Mrs. Clinton had acted improperly by firing seven employees.

Similarly her participation in the health care reform-working group did not constitute nepotism on the part of the president. Perhaps the most important—and least investigated of the Clinton incidents involved “illegal campaign contributions... and the possible give-away of classified material to the Chinese Army (again, for campaign contributions),” according to Gary W. Potter and Michael D. Lyman. Yet neither political party wished to delve too deeply into this issue given the prevalence of questionable campaign funds in major federal elections. Clinton’s presidency was a hybrid of social activism, program review techniques, and fiscal restraint. Reinventing government, later referred to as the National Performance Review (NPR), was undertaken with the stated purpose of “cutting red tape, putting customers first, empowering employees to get results, and cutting back to basics,” explain Aberbach and Rockman. Elements of the NPR are similar to the progressive vision—hire good people, give them the flexibility to perform their jobs effectively in the best interest of their customers, and reward them based on merit.

However, Clinton also imposed panoptic styles of corruption control during his eight-year tenure

as president, such as strengthening protections for inspectors general from administrative allegations (Executive Order 12993 of March 21, 1996), and allowing the office of special counsel (OSC) greater investigative authority (for example, permitting the OSC to investigate whistleblower complaints filed by Federal Aviation Agency personnel, and extending whistleblower authority to military personnel). Lastly, the Clinton administration aggressively employed anti-patronage-era techniques by encouraging IGs and other investigative agencies to make widespread use of the False Claims Act to deter future acts of Medicare and Medicaid fraud.

While some of Clinton's ideas may have resulted in streamlining government operations such reforms may also have had adverse effects by eliminating crucial checks and balances in government purchasing prevalent in the scientific administration era. Similarly, NPR's objective of eliminating 272,900 federal jobs likely impacted the executive branch's ability to monitor contractors and detect fraud in government programs.

#### GEORGE W. BUSH

In 2003, the George W. Bush White House appeared to be leaning toward the panoptic vision. Based on his steadfast support for strict penalties for corporate fraudsters, Bush quietly repealed the majority of tough corporate penalties found in his SEC reform during the summer of 2002. Similarly, Bush pushed to ensure that the new Homeland Security Department would not include whistleblower protection provisions for its workers, and that personnel would serve as excepted-service employees, thus affording them far less protection than career federal employees. Lastly, Bush, as with all of the former presidents and Congresses in American history, has been unsuccessful in producing a unified definition of corruption, neither does one exist in the U.S. Criminal Code. Whatever methodology for corruption control a president selects, the cyclical nature of corruption, as accurately predicted by Greek and Roman philosophers more than 10 centuries ago, suggests that efforts to eliminate such crimes will likely prove elusive at best.

## Corvair

THE CHEVROLET CORVAIR was manufactured by General Motors (GM) beginning in 1959 with the release of a 1960 model. The Corvair was unique for its time in that it was small and lightweight, with an air-cooled and rear-mounted engine and a swing-axle independent rear suspension. The design of the car led some to state that the Chevrolet Corvair was an unsafe vehicle that was prone to over-steering and flipping.

At one point, Chevrolet was facing well over 100 lawsuits dealing with damages or injuries to owners of Corvairs. It was these court papers and depositions that would become the bulk of the re-

*The Chevrolet Corvair, produced by General Motors, drew public attention to automotive safety.*

search for a young, unknown attorney named Ralph Nader. In 1965, Nader released his research on automotive safety in the form of a book entitled *Unsafe at Any Speed*. Nader claimed that the Chevrolet Corvair was the epitome of automotive disregard for safety.

It is worth noting that the Corvair was not the only car that Nader criticized in his book. In fact, the Ford Mustang and all models of Cadillac were also criticized. It was the Corvair, however, that Nader devoted the majority of his book to, as evidence of the design flaw in the Corvair pointed to the large number of lawsuits pending against General Motors. These arguments were furthered when the 1964 and 1965 Corvairs were released with improved designs.

Still unsatisfied with General Motors' handling of the situation, Nader criticized the company for not recalling the more than 1 million automobiles that had been sold prior to the redesign of the car. Due to Nader's statements, many consumers developed the perception that GM was greedy and that its only concern was for profits.

Using the fame generated by his book and by his testimony before Congress on automotive safety, Nader became a well-known advocate for change in automotive safety and the Chevrolet Corvair became known as the car that was unsafe at any speed. Today, there are still Corvair-owner clubs and many who believe that the criticism generated by Nader was ridiculous, and that the car is as safe as any other car manufactured during the same time

period. Nader has apparently softened his stance, as he has even spoken at annual Corvair-owners meetings in recent years.

DELTA STATE UNIVERSITY

## counterfeiting

COUNTERFEITING HAS two branches: the forging of coins and the forging of banknotes or bills. As the history of coins begins much earlier than the production of banknotes or bills, the forging of coins has a longer tradition dating at least back to antiquity. The forging of coins needs some special knowledge of metals and the ways of crafting such materials, whereas the counterfeiting of banknotes or bills necessitates know-how about paper production (including watermarks) and about several forms of printing.

Very early in both coin and banknote history, measures were taken by the legitimate issuers of such items to protect these precious objects against forgery and fakes. Coins often have special corrugation or coinage of the edge, which dates from the time when coins had a value not only defined by their denomination, but by the actual content of precious metal. By doing so, the issuers prevented the clipping by shaving or trimming of the coins. Paper money is even more difficult to protect. Special care was soon taken with the paper, the printing process, the watermarks, and in more recent time, with the holograph. A special identification tool for the issuer is the individual code given to every banknote.

But as the techniques employed by the issuers of coins and banknotes progress, so do the counterfeiting skills of the forgers. Also, the quality of counterfeits helps the forger to delay or to compli-

cate its detection; the decisive factor is always the best way to get those counterfeits in circulation. The emergence of high quality laser printers and color photocopying machines has aggravated the problem of counterfeit banknotes of primitive or modest quality and large quantities. On the technical level there is a (sometimes overlapping) distinction between complete forgeries and falsifications, whereby the latter may signify that only a denomination of a real banknote was altered, or the raw materials and techniques of the legitimate production process of coins were illegally used to produce counterfeits.

### MOTIVES

The basic question for the study of counterfeiting is not how to detect forged coins and banknotes, but find the reason why people forge such items in the first place. Greed as a personal motive may be an explanation in some cases, but, in fact, when structuring the main motivations for counterfeiting one has to keep in mind criminal, social, political, and economic motives.

The main groups of counterfeiting motives could be defined as follows: Counterfeits by criminal individuals or groups (organized crime) damaging to the issuer and the innocent person who gets the forged item without knowledge; the issuer itself produces counterfeits of its own products to cheat the recipient (especially with coins of precious metals suddenly produced with less material, or of not-so-precious metals without announcing this deterioration to the recipient); “counterfeits” of regular money by local authorities to have sufficient numbers of coins and banknotes in circulation at a moment when the centralized, legitimate issuer, for whatever reasons, is not able to provide sufficient stocks of money to keep the economy running; counterfeits as a ruse of war against an enemy, whereby the authorities of one belligerent secretly produce the currency of the foe to undermine the economy of the enemy, or to pay for war needs on the markets of third countries; counterfeits of rare coins and banknotes, whereby the damage is not done to the former issuer, but to the modern collector of coins and banknotes or bills.

Counterfeits by criminal individuals or groups is not only the oldest form of counterfeiting, but most people, at least unknowingly, come in contact with these counterfeits at several occasions during

their lifetimes. The list of names of famous forgers is long: the German Karl Peglow and the Polish-born Frenchman Czeslaw Bojarski, to name only a few.

In a class by himself, is without a doubt, Arturo Alvez Reis, who did not forge money himself but tricked the famous British banknote printer, Waterlow, with forged orders to print Portuguese currencies for him. The printer thought Reis was executing an official order by the authorities in Portugal. Reis founded a bank to distribute these “official” counterfeits and nearly managed to buy the Bank of Portugal when the scandal broke in December 1924.

### ISSUERS

Counterfeits by an issuer producing fakes of its own products to cheat the recipients were common from antiquity well into the 19th century. Coins of precious metals were produced with less precious metal, or less valuable metals without announcing this deterioration to the recipient. This form of cheating was only possible as long as the value of coins was not so much determined by their denomination, but by the actual value of the precious metal of the coin. When the denomination was no longer officially equivalent to the value of the metal, this form of counterfeiting ceased.

One could argue that fraud became even easier for the issuer as it only had to issue larger quantities of coins or more often banknotes and bills, which had virtually no material value compared to their denomination. Inflation created by the issuer (which in modern times nearly exclusively is the state) allowed it to get rid of state debts at home and abroad. Although there were other reasons for the hyperinflation in Germany in the 1920s, the monetary chaos was partially produced by the state printing more and more increasingly worthless notes.

More sophisticated were cheating systems, for example, in former Eastern Bloc communist countries: The state had the monopoly for changing currencies within those countries, and to set an exchange rate fixing its own currency at a fantasy rate against Western currencies like the U.S. dollar or the German mark. Any currency trade by private persons without using the official exchange bureaus was prohibited. Foreign visitors and tourists were forced to buy such bad currencies at an unreasonable price (often enforced by a certain amount of

money which had to be exchanged for each day spent in those countries without the possibility of re-change after the visit, because the export of such Eastern currencies was prohibited).

For example, the official East German exchange rate for the East German mark was 1-to-1 for the West German mark, whereas with traders in West Berlin (seen as criminals by the East German authorities) the exchange rate ranged approximately from 3-to-1 to 15-to-1 or even more extreme. Citizens of Eastern Bloc countries were usually prohibited or restricted from owning Western currencies. This case illustrates that counterfeiting, in a broader sense, is possible without forging or faking a single coin, banknote or bill.

## CIRCULATION

A currency before the age of electronic cash had not only to be guaranteed in value by the precious metal or the issuer, but, what was sometimes even more important, it needed to be to be available in sufficient numbers of coins and banknotes in every place of the region of its official or unofficial circulation. The problem still arises in high-inflation countries today, where sometimes stamps are used for trade because of the lack of sufficient numbers of small denomination coins. In time of war or internal crises, local authorities, small businesses or even private persons often have produced money of their own, which may have infringed the issuing monopoly of a ruler or a state.

Usually those issues are clearly distinct from the regular issues, but in certain cases imitate those regular issues and are thereby not by intent, but *de facto* "counterfeits." It could be argued that the issuing of money by local authorities or individuals to have sufficient numbers of coins and banknotes in circulation at a moment when the centralized legitimate issuer is not able to provide sufficient stocks of money is a good thing, because it keeps the economy running without doing too much damage to a currency already in trouble.

The problem was a permanent one, for example, in early American history. In the colonial era, there was no general currency available except a mixture of European currencies (especially from Britain, Spain, and France) and of local issues of the colonies. This diversity in itself was an invitation for counterfeiters, because the knowledge of currency values required more than a basic education

*The U.S. Treasury authorized changes in the early 2000s to the design of banknotes to foil counterfeiters.*

of precious metals values. Although tough and harsh laws against counterfeiting were in place in the colonies, the necessary control and enforcement agencies usually were not available or insufficient. Personal greed and criminal activities were the motives for most counterfeiters in this period, but it could be argued in boom times, counterfeiting actually helped the development of the economy, otherwise a lack of coins and banknotes may have virtually halted trade. This was true only as long as the receiver of a counterfeit was able to pass it on either because of general acceptance of counterfeits as currency, or because of non-detection.

## RUSE OF WAR

Counterfeits, as a ruse of war or as an unconventional method of warfare, used against an enemy

involve one belligerent secretly producing the currency of the foe to undermine the economy of the enemy, and/or to pay for war needs on the markets of third countries. Frederick the Great of Prussia and Emperor Napoleon of France are reported to have ordered, on a large scale, such practices during their various campaigns. One case of peacetime counterfeiting is the attempt by extremist elements of the Hungarian government to forge French francs during the 1920s. The Soviet Union allegedly produced forged dollar bills at the same time, but the real story behind this suspicion still remains sketchy.

A more certain case happened during World War II, when the Nazis decided to produce forged foreign currency (especially British pound notes) on a large scale (Operation Andreas). By 1942, the production of forgeries was transferred to workshops constructed inside Sachsenhausen concentration camp to increase the output (Operation Bernhard, as the SS officer in charge was Bernhard Krueger). In Sachsenhausen, all sorts of Allied documents were forged, but especially British pound notes, and from late 1944, U.S. dollar bills. It seems that the forgeries were first intended as leaflets for air-dropping over Britain, but later were used for financing Nazi foreign intelligence operations. At the end of the war, a large quantity of forged banknotes was dropped into Lake Toplitz in Austria. Several diving expeditions recovered remains from the lake in the Alps during the past 50 years. During the early Cold War, the Soviet Union and the United States accused each other of secretly continuing the Nazi forgery project. It may be that only the North Koreans, in fact, engaged in such an operation; forged dollar bills have been linked on several occasions to North Korean diplomatic officers.

## COLLECTORS

A special case of counterfeiting is the forgery of rare coins and banknotes to the detriment of the collector of such items. Collecting all sorts of things became fashionable during the Enlightenment period, and soon the supply of sought-after rare coins from antiquity (especially Greek and some Roman coins) could not fulfill the demand. One case was the forging of rare German coins from the 1950s, which happened in the 1970s. In this case, persons employed at the Karlsruhe mint (at that time one of the four West German mints),

on the order of an official of the federal ministry of finance, re-used production tools to make unofficial new editions, and sold them with the intention to deceive collectors. Sometimes the value of fakes of high quality and by famous forgers surpasses the value of the real thing. It must be pointed out that not all reproductions of ancient coins in the 18th and 19th centuries were intended as fakes. Many were produced and sold as reproductions, so the customer knew exactly what was being bought. In the process of reselling, this knowledge sometimes vanished by neglect or intent, whereby the reproductions suddenly functioned as counterfeits to deceive collectors.

Apart from the protective measures described above, the issuers of currency always tried to prevent forgeries by the threat of punishments. From antiquity to early modern times in many countries, the death penalty was the customary punishment to deter potential forgers. Today, harsh prison sentences are a regular conclusion of criminal law. In most countries, the police, in combination with experts of the national bank or the issuing authority, are in charge to investigate and to prepare prosecution. The rationale in most countries is the legal, sometimes constitutional, bond between the right to issue currency and the sovereignty of the state.

In the United States, this was fixed by the Legal Tender Act of 1862 and, consequently, the Secret Service as an agency of the Department of the Treasury was founded in 1865 to fight against counterfeiting (after the William McKinley assassination in 1901, the duty to guard the president was added). It should be mentioned that most factors about counterfeits of coins or banknotes are applicable to postal stamps, duty or tax stamps, ration coupons in wartime, and other money substitutes. The age of electronic cash has opened up new ways of cheating, which may, in the long run, be more important than the traditional craft of counterfeiting. Also, the forgery of branded articles as a form of modern "currency" may well surpass the economic damage of money counterfeiting.

MANNHEIM UNIVERSITY, GERMANY

## credit card fraud

THE CREDIT CARD has been around since 1958 when the Bank of America issued BankAmericard, which was the first revolving-credit card with universal merchant acceptance. The card started in California but grew from there. In 1966, Bank of America expanded its bankcard program by forming the BankAmericard Service Corporation. This licensed banks outside of California allowing them to issue cards to their customers.

By 1969, most regional banks converted their independent programs to either BankAmericard or Master Charge (now known as Visa or MasterCard). By 1970, more than 1,400 banks offered one or the other credit card. Today, Visa has more than one billion cards in use. Adding another 500 million of MasterCard users brings the total to 1.5 billion credit cards used annually. Seventy-one percent of all credit cards in circulation worldwide are issued in the United States.

In the early 1970s, customers used a credit card through a slide machine, which processed the credit card number leaving a receipt for the merchant and a carbon copy for the customer. Today, credit cards are used electronically, and the information is processed in a matter of seconds. From the beginning of manual machines to the modern electronic processors, credit cards have been used fraudulently. Any person who, for obtaining anything of value with intent to defraud, uses a credit card that has been revoked, cancelled, reported lost or stolen commits credit card fraud. Using the credit card

number without possession of the actual card is also a form of credit card fraud. More recently, stealing a person's identity in order to receive a credit card is another more threatening form of credit card fraud, because it works in conjunction with identity theft. Credit card fraud is a problem that affects the entire consumer credit industry. It is one of the fastest growing types of fraud and one of the most difficult to prevent.

Credit cards are an integral part of the American economy and their use is increasing worldwide. The extensive use of credit cards, however, has its drawbacks. Credit card fraud is primary among these problems. Across the globe, credit card fraud losses to Visa and MasterCard alone have increased from \$110 million in 1980 to an estimated \$1.6 billion in 1995. At this rate of growth, it could grow to well over \$30 billion by 2005. Credit card fraud has and will continue to increase mainly because of the ease of committing it. The biggest victim of credit card fraud is the financial institution and bank card company, but individuals are also victimized, mainly through identity theft or bad credit ratings. While losses to Visa, MasterCard, Discover, American Express and the institution issuing a credit card mount, several schemes have been identified.

### DUMPSTER DIVING

One of the earliest ways of committing credit card fraud was either by stealing the card from someone's wallet or by "dumpster diving" for carbons. These two ways have decreased with the advent of computers and electronic processing of credit cards. Now, one of the simplest ways to obtain a person's account information or actual credit card is through postal theft. Many people put their mail in their mailbox and raise the flag letting the postal worker know that there is mail to be picked up. Unfortunately, this also is a telltale sign for a fraudster. At the end or beginning of each month, many customers mail their bills, including credit card payments. Any person who steals the mail may now have access to personal information, including credit card account numbers, credit limits, and banking information. The fraudster can use this information to obtain additional cards or create new accounts without the knowledge of the true owner.

Advance payment schemes are also prevalent. Federal consumer credit regulations require that credit card issuers credit a customer's account as

soon as payment is received. This is now possible instantaneously since most transactions are electronic. Using a counterfeit or stolen credit card or credit card number, a fraudster either makes an advance payment on the card or overpays an existing balance using a counterfeit check. Because the account is credited upon receipt of payment, cash advances can be immediately drawn against the credit card before the payment has cleared. A fraudster can clear millions of dollars this way and it will go undetected until the next bill arrives.

### COUNTERFEIT CARDS

The fastest growing type of credit card fraud is the counterfeiting of Visa and MasterCard. New technology has aided criminals, with relative ease, in the production of existing credit cards and the creation of fictitious cards. Fictitious cards are more advantageous because there is no person truly responsible for the account. The credit card companies will notice that the account is not being paid and they will attempt to contact the account holder, but no one will exist.

The internet has helped this scheme to grow and some organized criminal groups are becoming very efficient at this activity. Counterfeiters sell the magnetic strips or the technology to duplicate the information from a valid credit card. These magnetic strips contain all the information a fraudster needs: names, account numbers, credit limits, plus other identifying information. Using a computer system and the right equipment, a counterfeiter can create a fraudulent credit card with ease.

Many financial institutions have also benefited from new technology in the creation of security features. Holograms were the first to be created as a fraud deterrent, but this does not stop fraudulent spending over the internet or in situations where there is no "gatekeeper." A store clerk is supposed to know that the credit card is fraudulent, but with so many banks and other financial institutions in the credit card industry, it is impossible for a clerk to know which cards are fraudulent.

Clerks are supposed to check the signature on the back of the credit card, but most do not even conduct this simple task, let alone examine the hologram or other safety features. With the increase of shopping by mail over the telephone or the internet, fraud has increased exponentially. There is no clerk to check the credit card in these transactions.

This creates an almost anonymous atmosphere where using fraudulent cards or numbers is easy.

One of the problems surrounding credit card fraud is the ambivalence of the consumer. Credit card agencies advertise a zero liability for credit card fraud. In some cases, a \$50 fee may be incurred, but this may also be waived. If someone's credit card is lost or stolen and it is reported, then the customer is not responsible for any fraudulent charges. It is relatively easy to know if your card has been lost or stolen; you are no longer in possession of it. However, if your credit card number has been stolen and duplicated, this is not apparent until a bill arrives with the fraudulent charges. Some criminals will even go as far as to change the mailing address on the card to avoid being caught by the consumer, thus extending the time the card may be used. Many criminals, though, will simply use the number to apply for a new credit card, one that is attached to your name, although you would be unaware of its existence.

It is true that a person may have little if any liability if his or her credit card or number is used illegally, but what most of the television commercials and credit card institutions fail to tell consumers is the hassle that is related to having your credit card used fraudulently. When a credit card is issued in someone's name, this appears on his or her credit report. If that credit card is then used fraudulently, this also appears on the credit report and this has some very serious consequences, especially if the card holder is completely unaware that an account has been opened.

Collection agencies and creditors will be looking for payment, thus looking for someone to make those payments. Most people do not even realize that there are other accounts opened in their names until they are ready to make a large purchase, like a car or house for example. A routine credit check is done and consumers are surprised to be turned down for a car loan or mortgage because of their "bad" credit. If this does occur, then it is the consumer's responsibility to clean his or her credit report, even if he or she can prove he or she never made any of the suspect charges.

The Fair Credit Billing Act (FCBS) established procedures for resolving billing errors on credit card accounts. It is the consumer's responsibility to contact the credit agencies in order to take advantage of the law's consumer protections. In many instances, it takes years for the credit agencies to

investigate the fraudulent activity; in the meantime, the car loan or mortgage may be delayed or outright denied. One of the best preventive techniques to keep a credit record safe and clean is by contacting the three credit agencies and reviewing credit reports on an annual basis. (The three agencies are: Equifax Credit Information Services, Experia, and Trans Union.)

## Crédit Lyonnais

THE FRENCH banking giant's bailout of California-based Executive Life Insurance Company (ELIC) was called "superb" by state officials in 1991, but by 1999 investigations revealed a scheme by which the bank profited through concealed ownership. Like many 1980s investors looking for dramatic gains, ELIC had invested heavily in junk bonds: high-yield, high-risk bonds issued by companies that are likely to default. Using junk bonds to fund corporate takeovers and restructuring had fueled the rise of investment house Drexel Burnham Lambert, which sold ELIC much of its portfolio. After Drexel Burnham collapsed, so did ELIC's investments, resulting in the largest insurance company failure ever.

California Insurance Commissioner John Garamendi chose Crédit Lyonnais's offer over that of a San Francisco-based group because the French company promised a four-cents-on-the-dollar higher payout to ELIC's policyholders. The gist of the deal was that Altus Finance, an investment house in

which Crédit Lyonnais was the majority owner, bought ELIC's junk bond portfolio for \$3.25 billion. A French insurance consortium, Mutuelle Assurance Artisan de France (MAAF), invested \$300 million in ELIC and assumed management of the company. A few other ELIC assets were sold. Garamendi touted the new insurance company, called Aurora National Life, as "one of the best-capitalized and safest insurance companies in America."

Less than four years later, it seemed that buying ELIC's junk bond portfolio had been one of Crédit Lyonnais' few wise moves. After Altus Finance posted substantial losses in 1993, the French government provided a \$4.4 billion bail-out of the state-owned bank. This was not sufficient to reverse a trend of losses caused by reckless investments. Beneficiaries of Crédit Lyonnais' generosity included Italian investor Giancarlo Paretto, whose default on loans to buy Metro Goldwyn Mayer studios left the bank with a \$2.5 billion investment in Hollywood, and a two-year deadline to divest it. The bailout ultimately reached \$20 billion.

In 1999, an anonymous whistleblower forwarded to San Francisco attorney Gary Fontana documents showing that the rescue of ELIC had involved illegal "parking" agreements that allowed Crédit Lyonnais to profit at the expense of policyholders. The trail was complicated. Under the Glass-Steagall Act, a foreign bank could not own an insurance company. Although it was known in 1991 that Crédit Lyonnais financed MAAF's acquisition of ELIC, the bank had signed agreements that it would neither own nor run Aurora National Life. However, MAAF had agreed to act as a front for Altus Finance, the Crédit Lyonnais subsidiary that bought the junk bond portfolio. By separating the two deals, Altus not only circumvented the law but also was able to keep hundreds of millions of dollars in profits from the rebounding junk bond portfolio, rather than sharing the bounty with Aurora policyholders.

Near the end of 1992, maturing bonds meant that Crédit Lyonnais would own a controlling share in several U.S. companies. Forced by law to own no more than a 25 percent stake in any U.S. company, Crédit Lyonnais sold the ELIC junk bond portfolio to Artemis, a company it had formed with one of its largest debtors, multimillionaire François Pinault. Crédit Lyonnais owned 40 percent of Artemis and had lent the company \$2 million so that it could buy the portfolio. In essence, Crédit

Lyonnais was funding its sales to itself. Artemis also received all of Crédit Lyonnais' parked shares in Aurora and, when the parking agreements expired, bought the insurance company.

In October 2003, the French government rejected a tentative settlement with U.S. prosecutors for \$585 million. Prosecutors hinted at criminal charges against former Crédit Lyonnais chief executive Jean Peyrelevade and demanded extradition of four senior executives from Crédit Lyonnais and Artemis. While French president Jacques Chirac urged a diplomatic solution, Crédit Agricole, the new owner of Crédit Lyonnais, called for a settlement as preferable to a possibly more public grand jury hearing.

Since Crédit Lyonnais had been privatized and Glass-Steagall repealed, the *Financial Times* mused that the rejected settlement would have meant "French taxpayers' money is being used to pay a fine to the U.S. government for a deal done by a bank, no longer state-owned, 12 years after it allegedly broke a law that no longer exists." The situation remained unresolved in early 2004, as does a class action suit by ELIC policyholders.

## Cressey, Donald (1919–1987)

DONALD CRESSEY is perhaps known most for his seminal work on organized crime, *Theft of the Nation: Structure and Operation of Organized Crime in America* (1969), based on his consultancy to the

President's Commission on Law Enforcement and Administration of Justice during 1966–67. His best-known work in white-collar crime was *Other People's Money: A Study in the Social Psychology of Embezzlement* (1953), which, as a dissertation under Edwin Sutherland at Indiana University, tested Sutherland's hypothesis that differential association was a viable explanation for white-collar crime.

Cressey's embezzlement study was based on 133 federally convicted "financial trust violators," finding that they could not be called "white-collar criminals" according to Sutherland's definitional criterion of respectability, and that differential association was not a meaningful explanation of embezzlers' involvement in crime. Embezzlers did not learn from significant others definitions favorable to embezzlement (although they did learn such definitions from co-workers), nor did embezzlers learn the specific techniques for committing the crime, which is another postulate of differential association.

Instead, when faced with financial problems, embezzlers needed to self-portray their embezzlement as nonharmful, now known as neutralization, particularly by some variation of the following statement: "I am only borrowing the money" (even though I don't know how or when it will be repaid). Cressey used analytic induction in *Other People's Money*, which involves deriving a commonly occurring precursor in all cases he studied (neutralizing the wrongfulness of embezzlement when faced with financial problems). Cressey's use of analytic induction has been seen as the study's major methodological flaw, because there may have been a tendency to force interpretation of facts to fit the common observation. Other researchers have since found that a financial problem is not a necessary impetus to embezzlement, nor is the process of neutralization.

Cressey's most notable contribution to the study of corporate crime is his insistence that the term anthropomorphizes because it attributes criminality to organizations rather than to individuals who commit crime on the organization's behalf. This reductionist position is a harsh critique against criminologists who assert that organizations commit crime independent of their employees. In particular, it was a critique of Sutherland's monograph *White-Collar Crime* (1949).

Although Sutherland defined white-collar crime in terms of illegal actions committed by respectable persons in the course of their occupation,

he actually studied the crime rates of corporations, not live persons.

## THE TEXTBOOK

After Sutherland's death in 1950, Cressey continued his mentor's original text, *Principles of Criminology*, which popularized differential association to young scholars in the field. The text spanned a total of 11 editions and almost 70 years (1924–92), an tremendous longevity for a social science textbook (David Luckinbill co-authored the last edition with Sutherland and Cressey). Cressey also co-authored several editions of another popular textbook (with James William Coleman), *Social Problems*. In 1982, he resurrected Donald Clemmer's classic 1939 work, *The Prison Community*, and wrote *Justice by Consent* (with Arthur Rosett, 1976) on plea bargaining, and *Criminal Organization: Its Elementary Forms* (1972).

The Donald Cressey Award is given by the National Council on Crime and Delinquency for outstanding academic contributions to criminology which promote programs and policies that are fair, humane, effective, and economically sound. The Cressey Award is given by the Association of Certified Fraud Examiners for lifetime achievement in the detection and deterrence of fraud.

## crime seriousness

**STUDIES OF CRIME** seriousness have existed since at least 1964. Those studies generally found that respondents perceive crimes of violence to be more severe than property crimes. Also, most of those surveys have found that there is consensus between different populations on ratings of crime seriousness. Most of these studies have looked at citizens' perceptions of severity of crimes, without a clear definition of what is meant by crime seriousness or severity. Generally, the only concept common to all definitions of crime seriousness has been the idea of perceptions of crimes. Furthermore, many of these studies place a greater emphasis on traditional core offenses, such as murder, robbery, and assault, than on white-collar offenses, and crimes committed by corporations.

Those studies that have compared white-collar and corporate offenses with traditional crimes and, so called victimless crimes, have found mixed results. Some studies have found that respondents assume that all crimes are, on average, of similar seriousness. Other studies, such as one of prosecuting attorneys, have found that white-collar crimes are not perceived to be nearly as serious as traditional street crimes. This lack of seriousness associated with white-collar and corporate offenses may be the result of a couple of related reasons. Until recently, white-collar crimes were rarely the fodder of news reports, in favor of more traditional street crime, particularly violent crimes. The second reason for this may be that many people have not considered the severe consequences of white-collar and corporate crimes.

If citizens were to consider the cost or consequences of white-collar crimes, their perceptions of the seriousness of such crimes might be much higher. This suggested outcome is demonstrated in a 2001 study by Sean Rosenmerkel, in which he surveyed 268 college students on their perceptions of the seriousness of the traditional street crimes versus white-collar crimes. He found that traditional violent crimes were rated as more serious than white-collar crimes. White-collar crimes were perceived as being more severe than traditional property crimes. The same trend proved true for respondents' perceptions of the wrongfulness and harmfulness of the different types of crimes. Given media attention to high profile white-collar crimes it may not be surprising that the respondents per-

ceived white-collar crimes to be more serious, harmful, and wrong than property crimes.

James F. Short, Jr. and Laura Schragger, have noted that there are three costs or consequences of white-collar crime. The first consequence is the financial cost of white-collar crime. In 1987, the FBI estimated the annual cost of white-collar crimes to be as high as \$200 billion dollars. Since the media has begun to report on large white-collar crimes, it appears that the FBI's previous estimate may at best represent a small part of the financial costs of white-collar crimes.

The second consequence of white-collar crime is the physical or human costs. The FBI *Uniform Crime Report* shows that there were 16,204 murders in the United States in 2002. Deaths from white-collar crimes are probably higher than that if one takes into account such things as unsafe products, tainted foods, unnecessary surgeries, and work-related deaths.

The third consequence is the social cost of white-collar crime. In American society, citizens look to rich and powerful persons for role models, as well as to corporations for moral support.

## critical theory

CRITICAL THEORY GENERALLY refers to the social theory with Marxist roots, that questions tradition and the status quo, explores and analyzes the origins of social inequality in capitalist societies and advocate radical social change. In criminology, it is an approach to the study of crime, which locates the

principal sources of crime in the structure of class inequality in society.

Drawing particularly on the work of Karl Marx and his collaborator Friedrich Engels, a primary tenet of critical theory of crime is that capitalism and economic inequality produce crimes. To explain white-collar and corporate crime, critical theorists argue that the problem is not that the individual persons who own and manage business organizations are immoral. Critical theory has adopted a structural explanation instead that focuses on the nature of society itself. A capitalist society in particular has been viewed as a fundamental source of inspiration for such crimes.

The capitalist system rests upon the systematic exploitation of the lower class and therefore encourages a level of impersonality and irresponsibility that is conducive to white-collar and corporate crime. One of the most dangerous conditions creating the propensity to white-collar and corporate crime is the need for capitalism to dehumanize people, transform many objects of human environment into commodities, and create false needs.

Critical theory suggests that crime is a rational or inevitable response to an economic system that generates competitiveness, greed, and egoism. Corporations specifically, with their emphasis on maximizing profit and minimizing cost to survive, will routinely violate antitrust laws, labor laws, worker safety laws, consumer protection laws, tax laws, currency regulations, environmental protection laws, trade laws, and conflict-of-interest laws.

Critical theory says honest capitalists cannot survive long in a real competitive system. The capitalist corporation houses and protects white-collar and corporate criminals. Doctors, lawyers, accountants, professors, and other decent professionals will violate the trust of the office or job they hold to satisfy their drive for private accumulation. One cannot explain white-collar and corporate crime in the terms of biological determination, differential association, or control theory. It is the nature and dynamics of capitalism that drives the rich and the powerful to commit crime on an everyday basis.

#### THE INSTRUMENTALIST PERSPECTIVE

Critical theory has also examined the process of legislation and enforcement against crime. The central idea of critical theory is that the law is political and it is not neutral or value-free. The law reflects

the structure of the power relationships of the society. Critical theorists are, however, divided by the extent to which the state protects the interests of capital. An instrumentalist critical perspective on law and regulation advances the view that, in a capitalist society, law is the direct instrument of capital, which reflects the rich and powerful class's control over the state and is intended to favor the interests of that class. Capital and the state elite are in fact one and the same. The wealthy and the powerful manipulate the definition of what is widely considered criminal in order to maintain their domination in society. For example, occupational safety laws and environmental protection laws are absent or weakly enforced, to promote the interests of business.

According to the instrumentalist critical view, the law in a capitalist society simply helps promote white-collar and corporate crimes. The modern corporation is a device by which those who benefit from its illegal activities may escape justice. The most successful corporations, those that accumulate the most are those that are the most criminal and the most adept at growing above the law. Such crimes, therefore, can be obliterated only by abolishing the private ownership of property and transforming the capitalist into a socialist society, where people live in egalitarian and cooperative relationships with each other. In such a society there is simply no need for criminal law.

The instrumentalist perspective, however, has been under attack for its oversimplified explanation of the relationship between the state and capital. It overstates the degree of homogeneity in the capitalist class and ignores the diversity of interests among the class.

#### THE STRUCTURALIST PERSPECTIVE

An alternative structuralist critical perspective argues that the state is structurally dependent on capital, but relatively independent from capital under certain circumstances. According to this perspective, in a capitalist society, law is used by the state to maintain the long-term interests of the capitalist system and control members of any class that poses a threat to its existence, rather than to advance the specific, immediate interests of capitalist elites and organizations. In this view, not all white-collar crimes would be punished. Only those that constitute a threat to the existing political order are pun-

ished by law, because doing so helps sustain the system and legitimates the state in the eyes of its citizens.

According to the structuralist view, the state is limited by capital in that it is responsible to secure the political, social, and economic conditions under which the capitalist class can profitably operate. Law ultimately reinforces capitalist values and serves capitalist needs of exploitation. Business has generally had disproportionate influence over the law-making process and enforcement.

Much of the critical theoretical work today is less concerned with the causes of crime than with how criminality is socially defined along lines of class, gender, and ethnicity. Crime and law are seen as a reflection of inequality in a capitalist society. Since the early 1980s, a number of new perspectives have emerged under the umbrella of critical theory. These perspectives include left realism, peacemaking criminology, feminist perspectives, and post-modernist criminology. Attempts to apply these perspectives to the analysis of white-collar and corporate crime, however, are at a very early stage.

## Cuba

LITTLE IS KNOWN about the nature and scope of white-collar crime in Cuba due to the closed nature of the communist society. However, there is considerable information on the role of American organ-

ized crime in Cuba and its association with white-collar crime in the years preceding the Cuban Revolution.

Ties between the American underworld and pre-communist Cuba began during Prohibition (1920–33), when Cuban sugar and rum were exported by mob-controlled syndicates to the United States. Cuba was also used as an international meeting place for Mafia-linked criminals. In December 1946, the heads of the American crime families met in Havana to settle their disputes and to plan for the future. The meeting was called by two of America's most influential mobsters: Meyer Lansky and Charles Luciano, who had just been exiled to Italy by the U.S. government. The purpose of the meeting was to reassert Luciano's dominance over American criminal operations.

Legend has it that it was at this meeting that the heads of New York's five Mafia families also agreed to increase their involvement in heroin trafficking. After the meeting, Luciano attempted to stay in Cuba, but the Cuban government forced him to return to Italy at the urging of the U.S. government.

#### ORGANIZED CRIME'S HEYDAY

The most active period for American organized crime in Cuba was the 1950s. Lansky, the entrepreneurial mastermind behind the American Mafia in the first half of the century, nurtured a strong relationship with Cuba's corrupt dictator Fulgencio Batista and was rewarded with the opportunity to open and operate hotel casinos in Havana. Lansky had taken over the gambling tables of Havana's Montmartre Club in the mid 1930s, and soon after Batista assumed power in 1952, he invited Lansky to expand his operations and even serve as a government adviser to help clean-up the many crooked games of chance and fraud operating in Cuban casinos. This invitation spurred a tidal wave of American mob investment in and control over legalized gaming in Cuba.

In the face of increased law enforcement scrutiny in America and buoyed by the unfettered support extended by Batista, Lansky and Luciano, along with Frank Costello and Santo Trafficante, Jr., viewed the Caribbean island as an ideal sanctuary within which they could expand their gambling empires. In his 1976 self-published book, *The Mafia Conspiracy*, John Scarne estimated that during the 1950s, the American Mafia indirectly controlled no

less than 19 casinos in Cuba. In return, Batista and his associates were compensated with millions of dollars in bribes as well as a percentage of the revenues of the mob-run hotel-casinos.

In effect, the Mafia's major white-collar criminality was not gambling activities, but rather the bribing and corruption of the Cuban Batista government. A crime that not only led to the end of Batista, but also to the rise of the anti-corruption Cuban Revolution.

Soon after the Cuban Revolution, communist leader Fidel Castro made it clear that American investors were no longer welcome in Cuba; he shut down most of the mob-operated casinos, proclaiming that the gangsters behind them were the ultimate, crooked metaphor of the American capitalist system. In 1959, Castro even briefly jailed Florida mob boss Trafficante, who had financial interests in Havana casinos since 1946.

Trafficante was later, allegedly, involved in a CIA plot to assassinate Castro, and according to his testimony before a Congressional committee in 1975, he recruited several other underworld figures for this purpose in the early 1960s. However, Sam Giancana, the long-time head of the Chicago Mafia, as well as some in the U.S. law enforcement community, believed that Trafficante had never intended to assassinate Castro, and instead began cooperating with the Cuban leader to kill U.S. President John F. Kennedy. Trafficante was called before a House of Representatives committee in 1978 to answer questions about a sworn statement by Jose Aleman that Trafficante told him, "Kennedy's gonna get hit."

One of the many conspiracy theories used to explain Kennedy's assassination in 1963 was that it was a coordinated effort between Castro and the American Mafia, stemming from their mutual hatred of Kennedy and his anti-organized crime crusading brother Robert, who was the attorney general in the Kennedy administration.

#### THE BAY OF PIGS

When Castro expelled American gangsters in the late 1950s and early 1960s, many of their Cuban associates fled to the United States, including those involved in Cuba's cocaine trade. They eventually settled in New York, New Jersey, and greater Miami which soon become central locations for the importation and distribution of cocaine from Colombia during the 1960s and 1970s.

Many of the Cubans who fled with the Batista loyalists were organized by the CIA in an effort to dislodge Castro by invading Cuba with a small force at the Bay of Pigs, a secluded inlet on the Cuban coast. Due to lack of military air support and proper planning, the invasion force was quickly repelled by Castro's troops, resulting in an unmitigated political disaster for Kennedy.

After the Bay of Pigs debacle in 1961, members of the CIA-organized Cuban exile army were expected to disband and go into lawful businesses. However, as author Donald Goddard points out, "They had no lawful business." At first, the Cuban exiles imported only enough cocaine to satisfy members of their own expatriate community in the United States. However, by the mid-1960s, the market had expanded far beyond the Cuban community, which resulted in a dramatic increase in the quantities imported into the United States.

Until the early 1970s, the importation of cocaine (as well as marijuana and Quaaludes) into America was largely a Cuban operation, but by the late 1970, the Cubans remaining in the cocaine business had become subordinate to Colombians. While the location of Cuba between the United States and the cocaine-producing countries of South America continues to make Cuba a logical trans-shipment point for traffickers, according to an international narcotics control strategy report prepared by the U.S. State Department, Cuba is "not a major transit country for drugs coming to the United States." However, in 1989, Cuban General Arnaldo Ochoa Sanchez and several other officers in the country's Ministry of the Interior were arrested on charges of drug-trafficking. The so-called LaGuardia Group headed by Ochoa began trafficking in 1987. A key question was whether this activity was authorized at the highest levels of the Cuban government. Trial evidence and press reports indicate that higher authorities in Cuba did not authorize drug-trafficking; rather, the LaGuardia Group's cocaine trafficking activities was based on ambition and a misguided desire to obtain as much hard currency for Cuba as possible.

STEPHEN SCHNEIDER, PH.D.  
RYERSON UNIVERSITY, CANADA

## Cullen, Francis T. (1951–)

FRANCIS CULLEN, distinguished research professor in the department of criminal justice at the University of Cincinnati, is a prolific and widely read scholar. As of 2003, he had published over 170 works covering crime and deviance theory, corrections, white-collar crime, public opinion, and sexual victimization. He is the recipient of the Outstanding Scholarship Award from the Crime and Delinquency Division of the Society for the Study of Social Problems and has served as president of the Academy of Criminal Justice Sciences and the American Society of Criminology.

Having experienced the public and political unrest of the 1960s, social context and consequences have played a major role in shaping Cullen's career. Cullen attended an inner-city Boston, Massachusetts, high school during a time when racial equality dominated public and political agendas. He began his studies in urban education at Columbia University in 1974. His deviance and social-structure course with Richard Cloward, who later became his mentor, and the influence of Robert Merton inspired much of his subsequent work. He received his Ph.D. in 1979 in sociology and education from Columbia University. His dissertation, *Rethinking Crime and Deviance Theory: The Emergence of a Structuring Tradition*, was published in 1984.

Cullen's contributions to the study of white-collar crime and criminology emphasize the role of social context and public policy. His case study (with Willaim Maakestad and Gary Cavender) of

the corporate misdeeds in the Ford Pinto case focused attention on the process and difficulties of prosecuting white-collar crime under criminal law.

### FLAMING PINTOS

The Pinto case erupted in 1978 when the automobile was found to engulf in flames after being rear-ended. In one case, two passengers trapped in the car died. The fires were caused by the location of the gas tank and Ford's decision not to fix the defect, based on a cost-benefit analysis, came from an insider whistleblower's complaint. Ford Motor Company was brought within the realm of criminal law when the state of Indiana charged the company with reckless homicide, though the jury voted for an acquittal.

The case presented by Cullen further fueled public and academic interests in corporate unlawfulness, and the usefulness of the case-study method for explaining and understanding white-collar crime. His 1998 book (with Michael Benson) represented a major contribution to the means and methods of prosecuting white-collar criminals. *Combating Corporate Crime* explores the role of the judicial system and the efforts by local prosecutors to control fraud and ensure accountability for corporate misconduct.

## currency fraud

CURRENCY fraud is the production or manufacturing of paper money and coins, without the right

to do so, replicating currency already circulating within the economy with the purpose of deceiving and defrauding, or genuine paper currency which has been altered to increase its face value. One of the first episodes in American history involving the production of fraudulent paper currency occurred during the American Revolution. In 1775, the Continental Congress issued \$242 million in Continental currency to finance the Revolutionary War. The British, however, were able to replicate this currency and began distributing it throughout the American colonies.

As a result, the currency issued by the Continental Congress rapidly depreciated and was soon deemed worthless giving rise to the phrase "not worth a Continental." Subsequently, the Founding Fathers were compelled to declare the production of fraudulent currency a crime. Therefore, they bestowed upon Congress the power to punish such an act by means of the Counterfeiting Clause contained within Article 1, Section 8, of the U.S. Constitution. According to the Counterfeiting Clause, "Congress shall have power ... to provide for the punishment of counterfeiting the securities and current coin of the United States."

The production and circulation of fraudulent currency became a severe problem in the United States during the Civil War. At this time, there were approximately 1,600 state-chartered and unregulated banks each of which designed, issued, and printed their own banknotes. These notes were easily replicated and over 30,000 different varieties were in circulation, which led to massive confusion and bank failures throughout the country. To address this problem, Congress standardized American banknotes in 1863 by issuing a single national currency. These national bank notes, commonly referred to as greenbacks, contained complex designs and were printed on a high-quality cotton and linen paper authorized by the U.S. government.

This newly established national currency curtailed the fraudulent replication of paper notes only briefly and shortly thereafter, fraudulent currency flooded the economy once again. Consequently on July 5, 1865, the Secret Service was established as part of the Department of the Treasury, with the sole mission of protecting the integrity of U.S. currency. Within 10 years, the production of fraudulent currency was curtailed.

In 1913, Congress passed the Federal Reserve Act establishing the nation's Federal Reserve Sys-

tem, which authorized Federal Reserve banks to issue Federal Reserve banknotes. The following year, the banks began to issue the Federal Reserve banknote, and since its inception, the design of U.S. States currency has remained largely unchanged. The Bureau of Printing and Engraving, a branch of the Department of the Treasury responsible for production of U.S. security documents, has relied entirely on special inks, paper, and a printing process once thought to make the fraudulent production of currency extremely difficult, if not impossible, through a process called intaglio printing. Intaglio printing utilizes a very costly and powerful press that forces ink to penetrate the distinctive, high-quality paper that consists of 75 percent cotton and 25 percent linen, embedded with red and blue fibers, which has been manufactured exclusively by Crane Paper in Massachusetts since 1879.

Intaglio printing uses an estimated 20 tons of pressure per square inch, stretching the paper's cotton and linen fibers, and causing the green and black ink to penetrate below the paper's surface. The end result is a paper note containing fine lines and intricate detail, which has made it very difficult to duplicate.

Subsequently, those engaging in the production of fraudulent paper notes have been forced to use a more common cotton and linen paper and offset printing presses, resulting in the loss of intricate detail as well as a poor quality of print. Once printed, the fraudulent paper notes are placed in a washing machine in order to give the look, feel, and appearance of a genuine paper note that has been in circulation for quite sometime. In some instances, bills of lower denominations have been bleached removing the ink from the paper and reprinted as a bill of higher value. A simpler and more common form of currency fraud is the raised note. The raised note is genuine paper currency, which has been altered in an attempt to increase its face value. This process involves gluing numerals from notes of higher denominations to the corners of notes of lower denominations, such as using a \$1 bill to make \$100 banknote.

The 20th century, however, has ushered in remarkable advances in computer and photographic technology making it possible for people, without any sophisticated training to easily replicate and manufacture fraudulent currency. Those engaging in the production of fraudulent currency have now added digital scanners, advanced full-color copiers,

ink jet printers, laser printers, and advanced graphics software to their arsenal. These technologies have allowed those engaging in the production of fraudulent currency to produce high-quality fraudulent bank notes.

## CURRENCY REDESIGN

As a result, in March 1996, the Department of the Treasury released into circulation newly designed U.S. currency for the first time in over 70 years containing the most advanced security features available. The most obvious change in design is the much larger, off-centered portrait, incorporating more detail making it easier to detect fraudulent bills. Moving the portrait off-center allowed for the inclusion of a watermark depicting the same person shown in the portrait. This feature prevents someone from bleaching the ink off bills of lower denominations and reprinting them as a bill of higher value.

Furthermore, the numerals on the lower, right-hand corner of the bill have been printed in optically variable ink, which changes in color from green to black when viewed from different angles. Moreover, a nylon security thread imprinted with the value of the note is now located in a different position on each denomination thereby making it virtually impossible to bleach bills of lower denominations with the hopes of producing a bill of higher face value.

Others around the world, however, have refined the production of fraudulent U.S. currency into an art. As a result, the Secret Service's mission has become global. In 2002 for example, the Secret Service seized \$86 billion in Colombia. The Secret Service and Colombian law enforcement agents discovered a metal plate in the middle of a banana plantation covering a hole that led to an eight-foot tunnel, which in turn led to a narrow passageway. Once inside, the agents discovered a 12-by-15-foot room that housed a state-of-the-art printing press, negatives, and ink. An investigation revealed that the printing press was used to manufacture approximately \$20 million in fraudulent U.S. currency that had entered into world circulation over a 10-year period.

According to the Secret Service, those involved in the production of fraudulent currency in Colombia have used advanced techniques including burning images of genuine currency onto metal printing

plates. Paper, once used for the production of Venezuelan bonds and closely resembling the paper used by the U.S. Bureau of Printing and Engraving, is then passed through a printing press eight to 10 times, producing a fraudulent paper note that feels and looks like genuine U.S. currency. The difference, however, is that fraudulent currency created and manufactured in Colombia has the watermark and security strip printed on, rather than imbedded within the paper itself.

The Department of the Treasury has made it much more difficult to manufacture fraudulent currency by employing the most advanced security features available. Even if technology could replicate each security feature, there is no single counterfeiting machine that could replicate all features simultaneously. Even those considered expert in the production of fraudulent currency and possessing state-of-the-art technology, such as the Colombian operations, are unable to produce an exact replica of a U.S. Federal Reserve banknote.

## cyberstalking

THE TERM *cyberstalking* is generally considered to refer to the act of harassing or threatening an individual through the use of the internet and elec-

tronic or computer communications. The most commonly employed communication method used in the commission of this act is e-mail. However, there is a growing belief that instant messaging is seeing an increased use in cyber stalking in the early 2000s. For a victim to prove cyberstalking, she must be capable of proving that the messages were threatening and inflicted fear upon her life.

If the message is such that a reasonably prudent person would not believe that the sender was, in fact, threatening the victim, then there is no case for alleging cyberstalking. Distinguishing between the presence of a threatening message and one that is designed to merely aggravate a recipient is not always an easy task.

This statement, however, should not be construed as indicating that multiple messages are required. Contrary to popular belief, it is possible for the first, or even only, electronic message to be considered threatening, and thereby result in the individual committing an act of cyberstalking. Cyberstalking is considered a dangerous crime because many times the stalker will transcend the virtual world and begin stalking a victim in the physical world.

In much the same manner as traditional stalkers, it is believed that many cyberstalkers select their victims by first becoming acquainted with the individual in a social setting. The major distinction between a physical-realm stalker and the stalker in cyberspace is that many times the victims and the stalkers can easily come from different locations around the world.

The very nature of cyberspace, with its anonymity and worldwide access, lends itself to the development of international victims, as well as victims of opportunity, or victims who are not acquainted with the stalker. At any given time on the internet, there are hundreds of thousands of topic-centered chat rooms in operation that allow individuals, who have never met face-to-face, to converse as if they are long-lost friends. The level of anonymity in these chat rooms has been shown to lead some individuals to make statements and commit acts they would never have considered if the discussions had taken place in the real world.

The exact extent of cyberstalking is currently unknown, as data concerning the breadth of the problem is lacking. Few victims may understand that electronic harassment is illegal, and even worse many law enforcement agencies have yet to fully

begin investigating reports of this crime. In addition, statutes criminalizing cyberstalking have only recently been put into place, with California being one of the first states to criminalize the behavior, and several states yet to criminalize electronic harassment and stalking.

Further, federal statutes have been criticized for their failure to account for situations in which cyberstalkers post misleading information about a victim, and then use unknowing individuals to assist in the harassment of a victim. There is hope for future research concerning this issue, as more law enforcement agencies have begun to seriously investigate the crime and an improvement in the current

records are sure to create valuable research opportunities.

## **daisy chains**

A DAISY CHAIN IS the terminology used to describe a series of businesses that are connected together for purposes of a business transaction. Normally, the transactions involved are either criminal or fraudulent activities, and the businesses are “chained” together in an attempt to make investigating the criminal activities of the companies difficult.

Investigators devote endless time and energy to locating a company at the end of a daisy chain, only to discover that by the time the end of the chain is located, the corporation that has chained the companies together may have removed the final company in an attempt to hide the activities.

The use of daisy chains is perhaps best exemplified in the transactions of oil and fuel companies. The oil industry is controlled by legislation that mandates the pricing of oil. Therefore, no one company can obtain the same profit that could arise in a free market, because no one company is allowed to sell oil at the maximum price that the general public will pay.

Daisy chains attempt to increase profits by aligning companies that will sell the oil to each other. The first company will obtain the oil at the average market price of the commodity. Company number one will then sell the oil to company num-

ber two in a manner that maximizes its allowable profits. Company number two will then operate in the same manner, selling the oil to a third company and maximizing its profits in the process.

This process continues throughout the daisy chain until such time as each company involved has maximized its profits. Once everyone has profited, the oil is then sold to a legitimate company that is not a part of the daisy chain. This company is then forced to pay a significantly higher price for a product. Thus, each of the companies in the daisy chain maximizes its profits at the cost of the end purchaser.

The use of a daisy chain in fuel-fraud schemes is often linked to the activities of organized crime groups such as the Russian Mafia. These entities employ daisy chains to falsify state and federal tax forms involving the sale of fuel. Several companies are established, as is a “burn company.” The burn company is nothing more than a company that exists only on paper. When investigators begin to close in on the criminal activity, the burn company is destroyed.

Because the company exists only on paper, there is no record of assets and the trail dissolves. Through the use of these falsified companies, organized crime groups can make as much as 50 cents per gallon, costs that are saved from not paying the federal and state taxes. With these savings it is pos-

sible for operators of the daisy chain to sell fuel at a lower price than their competitors. By undercutting the prices of legitimate fuel retailers, the organized crime group forces their competitors out of business. The former competitors can be bought out and the fuel prices can be increased.

Daisy chains have also been linked to the activities of stock traders and investment firms, but their use is primarily linked to fraudulent activities that involve the sale of commodities like that of fuel and oil. The very nature of daisy chain schemes make the investigation and prosecution of operators difficult, and leads to a need for better training and awareness among those in the criminal justice field who encounter such operations, awareness that is sure to be increasing every passing day.

## Daiwa Bank

THE DAIWA BANK SCANDAL received significant media coverage in both the United States and Japan. On September 25, 1995, Daiwa Bank, one of Japan's largest banks with offices worldwide, admitted that Toshihide Iguchi, the head of bond trading in the bank's New York City branch had misappropriated \$1.1 billion of customer securities over a period of 10 years to conceal trading losses. On October 9, 1995, Daiwa officials made the additional disclosure that it had concealed more losses in excess of \$97 million dollars that had been shifted to a corporate shell in the Cayman Islands between 1984 and 1987.

On November 2, 1995, the U.S. Federal Reserve announced the closing of the bank's American operations. The bank was required to provide federal regulators with status reports every 5 days over the 90-day period within which it was required to termi-

nate and withdraw all operations from the United States for three years.

The severity of the penalties originally faced by Daiwa Bank (expulsion and a 24-count federal indictment carrying \$1.5 to \$4.4 billion in fines if convicted, rather than fines alone) was attributed to the fact that the bank was not more forthcoming with disclosure of its losses. The bank did not inform the powerful Japanese Ministry of Finance until August 8, 1995, and the ministry did not, in turn, inform U.S. regulators until September 15, 1995. By these actions, both the bank and the ministry showed a disregard for U.S. law, resulting in a breach of trust between governments. Fortunately, the bank had enough money to cover the losses.

The Daiwa Bank fiasco was not a problem particular to the Japanese institutional and cultural context. Rather, Daiwa Bank underscored how lenient internal controls and regulatory scrutiny had created conditions that contributed to similar scandals threatening the viability of top financial institutions around the world.

In banking circles, it is widely accepted that employees have incentives to breach management controls and compliance procedures. Banks need to respond by adopting internal controls and submitting to regulatory oversight in an effort to locate violators before the firm is exposed to billions of dollars in risk.

Prompt and immediate disclosure and cooperation with regulators has been recommended as the most immediate remedy to the ongoing problem of employees finding loopholes in the management controls and compliance procedures. Doing so not only protects a firm from the accumulation of higher losses in the long-term, but a prompt response enables a firm to establish a credible track record. U.S.-based traders such as Prudential Securities and Salomon Brothers, have, upon report of major infractions, been allowed to continue business with payment of substantial fines.

Although these firms were found guilty of infractions varying from failure to inform investors of the extent of risk associated with their purchased investments to concealment of losses, immediate disclosure allowed them to preserve their reputations.

## Dalkon Shield

THE DALKON SHIELD was a defective intrauterine birth control device manufactured and sold by the A. H. Robins Co. of Richmond, Virginia, from January 1971 through June 1974. It cost \$3, but caused numerous injuries, including miscarriages, loss of female organs, and infertility. Like other intrauterine devices, the Dalkon Shield was designed to be inserted inside the uterus, where it usually prevented pregnancy by making it difficult for a fertilized egg to attach itself to the wall of the womb. Robins sold 4.5 million Dalkon Shields around the world, including 2.8 million in the United States.

The Dalkon Shield appeared on the market just after the sexual revolution of the 1960s. Women, whether married or not, were no longer bound by compulsory images of motherhood, yet there was no 100-percent effective birth control method yet developed. The "pill" required a woman to remember to take it on a daily basis. There were also the various health concerns and adverse effects of the pill to contend with. The Dalkon Shield was touted as being a safer and more effective method of birth control than the pill.

When the Dalkon Shield was marketed, there were no required tests by the Food and Drug Administration (FDA) for the manufacturing of medical devices to prove that they were safe and/or effective. Only one small study was performed on the Dalkon Shield, after it was sold worldwide. The testing of the Shield is a clear-cut case of conflict of interest. The inventor of the Shield was the person who tested it. Moreover, if that was not bad enough, he was heavily invested in the product. He was entitled to a percentage of the profits from its sale. Before A. H. Robins purchased the rights to the Shield, executives were informed that the tests

may not have been adequate, but they ignored the warnings.

The device was defective. It had a major design flaw. The device had a nylon tail that hung through the opening of the uterus for doctors to check to make sure the device was still in proper place. The tail, however, allowed bacteria to travel up the device's wick and into the womb causing infection, which sometimes resulted in sterility. The Shield was not a very effective birth control device, yet A. H. Robins promoted it as the most effective form of birth control on the market. They advertised it as having a 1.1 percent failure rate. This was false because approximately 5 percent of the women using the Shield actually became pregnant.

The women who became pregnant suffered miscarriages and other reproductive system problems, like PID (pelvic inflammatory disease). Twenty women died from complications associated with the Dalkon Shield. The death rate may be higher, especially in Third World countries where statistics are not collected. The women who wore the device were not the only victims. Hundreds of children were born with injuries inflicted by the Dalkon Shield because it was not removed during pregnancy. Children were born with blindness, cerebral palsy, and mental retardation.

Despite the fact that A. H. Robins had early indications of these problems, they neither voluntarily warned women nor withdrew the Dalkon Shield from the market because the product was highly profitable. They did not even order more testing of the product. In fact, the company launched one of the most aggressive promotional campaigns in its history.

Even with knowledge that the Dalkon Shield was prone to pelvic infections, A. H. Robins promoted the Shield widely to doctors and general practitioners. They also advertised that the Dalkon Shield could be safely left inside the women for up to five years, even though medical evidence stated that the longer the Shield was in place the greater the risk of infection and complications.

As more and more reports of infections, pregnancies, and miscarriages were reported, the FDA investigated the Dalkon Shield. After much stonewalling by the company, the FDA halted distribution of the product in 1974. To completely protect Shield users, health experts said a complete recall should have been ordered. However, the FDA ordered a voluntary suspension of sales instead.

Since A. H. Robins was not ordered to recall the product, they did nothing to warn the thousands of women who were already users of the dangerous product. It was not until 10 years later, in 1984, that the company undertook a massive media campaign to inform the women wearing the Dalkon Shield, in the United States, to have them removed at A. H. Robins's cost. This was done only after Robins' liability insurer, Aetna, canceled their policy because they discovered that Robins had failed to disclose relevant information and, in some cases, provided false and misleading information to doctors and women.

Many of the injuries from the Dalkon Shield happened to women between 1974 when A. H. Robins stopped marketing it in North America and 1984, when the company finally wrote to physicians and sponsored a media campaign aimed at reaching women to recommend its removal. However, A. H. Robins continued to sell the Shield abroad.

#### LITIGATION AND SETTLEMENT

Lawsuits were filed not long after the Shield was on the market. During pre-trial discovery in many of the cases, documents retrieved from Robins showed that the company definitely knew about the device's proclivity to cause life-threatening pelvic infections. They were aware of this and withheld the information and, in some cases, evidence was destroyed.

Early on, the Dalkon Shield did undergo some design changes. These were never tested. The designers added copper to the mold so the device would show up easier on x-rays, and it was also thought to be an enhancement to its effectiveness. Adding copper to the device would mean that the FDA should have given pre-market approval for the device because the copper would have a medical effect. A. H. Robins did not want to have to get FDA approval. That would require more rigorous testing and the Shield might never had made it to the market. In order to avoid such testing, A. H. Robins told the FDA that the Dalkon Shield contained less copper than it actually did.

A. H. Robins officials deliberately adopted a defense strategy of dragging out any case. This was done to make it expensive and difficult for the injured women and their attorneys to file suit. If the case did go to court, A. H. Robins' attorneys, in some cases, personally attacked the women plaintiffs by insinuating that their sexual and hygiene

habits, rather than the Dalkon Shield, were responsible for their injuries. The attorneys said the number of sexual encounters and partners caused pelvic infections and this was the cause of their problems, not the Dalkon Shield.

Two top executives were found guilty of criminal contempt. Flooded with lawsuits, Robins sought bankruptcy protection from litigation in 1985. A bankruptcy filing automatically halts all litigation against a company, and the women injured by the Dalkon Shield were converted to creditors instead of plaintiffs.

There were over 300,000 Dalkon Shield claims filed in the bankruptcy court. The Dalkon Shield Claimants Trust was established in 1989. A \$2.3 billion trust was set up by American Home Products Corp., a Madison, New Jersey-based company that bought A. H. Robins. During the 1990s, the Dalkon Shield Claimants Trust paid out nearly \$3 billion to more than 200,000 women who had used the intrauterine contraceptive device, making it one of the most successful settlements for claimants of mass tort litigation.

The average claimant represented by a lawyer got about \$21,000. However, most of the women did not receive much compensation, only about \$725. The largest payment was more than \$2.2 million to the family of a severely deformed girl born after being conceived while her mother was using a Dalkon Shield.

Today, pre-market testing requirements exist for medical devices because of the Dalkon Shield catastrophe. The Food, Drug, and Cosmetic Act of 1938 placed medical devices under federal control, but they were not subjected to pre-market review until 1976. The Medical Device Amendment of 1976 was enacted in direct response to the Dalkon Shield fiasco.

## day fines

DAY FINES ARE ALSO commonly known as structured fines and refer to monetary fines that are calculated on the basis of a convicted individual's financial status. Originally used in Europe, day fines differ from traditional, pre-established fines in that they are calculated using a two-step mathematical formula. The first step of calculation involves the individual's offense being rated on an established scale using the gravity of the offense as a basis for consideration. The second step involves multiplying the number of units from step one by a percentage of the offender's daily income. Along with daily income, the number of dependents living with the offender is considered, as is any additional financial considerations deemed important by the court.

Sweden developed the day fine system in the 1920s, and its success led to its adoption by West Germany in the early 1970s. After day fines used in West Germany led to a 90-percent decrease in sentences of less than six months, the United States elected to attempt the use of the sanction in 1988. Richmond County, Virginia, under the guidance of the Vera Institute of Justice, successfully employed the sanction for one year and found that judges were more likely to use day fines than short jail sentences. Additionally, fine amounts increased by a significant amount and collection rates in the court system rose to 85 percent.

The use of day fines has received mixed support in the criminal justice system, with supporters arguing that the system is effective because it deters financially secure individuals from committing crimes and, at the same time, provides financial revenues for the court. The deterrence argument stems from the belief that traditional fines, which are equal regardless of social class, do not inflict sufficient harm on a wealthy defendant. Therefore, a

wealthy defendant may commit a crime because she realizes she is capable of paying the fine without losing a significant amount of income. Under the day fine system, this same individual may reconsider her desire to commit a criminal act because she fears the financial result of the act.

Day fines also prevent the already over-burdened criminal justice system from having to deal with offenders who pose less of a risk to the public. Instead of the justice system paying for a supervised release or treatment program, the offender is instead paying the court for her mistakes. The only true criticism of the system is that the method of calculation leads some to argue that offenders could hide their income for purposes of avoiding high day fines, a problem that is believed to be correctable with proper management and training in the application of day fines.

## debt restructuring fraud

DEBT RESTRUCTURING fraud is a method whereby an individual or an officer of a corporation with outstanding debt obligations knowingly and fraudulently conceals or transfers assets belonging to the estate of the debtor, prior to a Chapter 11 bankruptcy filing, with the intent to defraud creditors and avoid legitimate debts.

Debt restructuring fraud, referred to as fraudulent transfer or concealment, is defined within the bankruptcy fraud statute, codified at 18 U.S.C. §152, and states, "A person who in a personal capacity or as an agent or officer of any person or corporation, in contemplation of a case under Title 11 by or against the person or any other person or corporation, or with intent to defeat the provisions of

*The prospect of business failure can lead executives to attempt various forms of debt restructuring fraud.*

Title 11, knowingly and fraudulently transfers or conceals any of his property or the property of such other person or corporation shall be fined not more than \$250,000 or imprisoned not more than five years, or both.”

Generally, 18 U.S.C. §152 requires that the fraudulent transfer and concealment of assets by the debtor occur knowingly and fraudulently. Precise definitions of “knowingly” and “fraudulently” are provided within 18 U.S.C. §152. Accordingly, the term “knowingly” means, “the defendant is aware of his or her act or failure to act and that his or her conduct is undertaken voluntarily and intentionally and not because of mistake or accident or other innocent reason.” The term “fraudulent” means, “the conduct was willful and done voluntarily and intentionally and with the intent to deceive, cheat, or defraud. An intent to defraud is accompanied, ordinarily, by a desire or purpose to bring about some gain or benefit to oneself or to cause some loss to some person.”

In order to sustain a conviction under 18 U.S.C. §152, the government must prove beyond a reasonable doubt that the defendant “knowingly and fraudulently, concealed from an officer or the creditors, in a Title 11 case, property belonging to the estate of the debtor.”

In many cases involving debt restructuring fraud, business owners blatantly transfer corporate assets prior to a bankruptcy filing for their own personal benefit. Examples of obvious fraudulent transfers include: transfer of corporate funds to pay the owner’s personal debts; transfers to third parties who in turn provide insiders with significant gains; and cash transfers directly to the owner of the corporation for no legitimate business purpose or activity.

## CHAPTER 11 TRICKS

For example, a business owner files a Chapter 11 bankruptcy because his company is facing a severe cash shortage. Just prior to filing for bankruptcy, the business owner transfers large sums of cash and other company assets to family members and other business interests in which he controls, thereby concealing and protecting his assets from sale or liquidation. Business owners have also taken more extreme measures when financial failure appears forthcoming, such as large retroactive raises, large bonuses, and redemption of company stock.

Although the majority of fraud in bankruptcy proceedings consists of the concealing or transfer of assets, there are a number of schemes designed primarily to maximize company profits prior to a bankruptcy filing, including bust-outs, bleed-outs, and parallel entities. According to the Federal Bureau of Investigation, the bust-out is one of the more common bankruptcy crimes involving the fraudulent restructuring of debts. A bust-out involves the creation of a business that is designed to fail from its very inception. Typically, an operator of a bust-out will open a business and establish a solid credit rating with large consumer goods manufacturers.

Eventually, the operator will purchase merchandise on credit. Once obtained, the merchandise is either sold for cash or transferred to business associates. A bankruptcy is then filed, leaving creditors without any recourse for collection. According to the Department of Justice, following a bust-out, “records are destroyed, fires are set, and robberies are faked in an effort to disguise what actually took place.”

A bleed-out is similar to a bust-out, except it involves depleting the assets of an existing company over a relatively long period of time. A bleed-out typically involves a stable company with very liquid

assets, such as a large pension or profit-sharing fund that is acquired through a leveraged buyout, often by a corporate raider. Once acquired, the company continues to operate until all available assets are depleted. Once all the assets of the company have been depleted, a Chapter 11 bankruptcy is filed allowing those raiding the company to complete their scheme.

Lastly, when a long-standing company experiences financial difficulties, business owners may create a second business, or a parallel entity, which mirrors the first business, prior to or immediately after a bankruptcy filing. Once a Chapter 11 bankruptcy has been filed, the business owners continue to operate their original business until they have successfully transferred all "inventory, receivables, customers, and good will" to the newly established company, explains the Department of Justice. In some instances, business owners will continue obtaining goods as their original business, and then transfer them to their parallel entity without any intent on ever repaying creditors.

The bankruptcy system was created to provide a forum in which creditors and debtors could compromise settlements in ways satisfactory to both and help provide a fresh start to those with a demonstrated financial need. The bankruptcy system, however, has been manipulated and its integrity comprised. According to the Federal Bureau of Investigation, "the wider acceptance of bankruptcy in the United States has led to a 500 percent rise in bankruptcy filings since 1973. By 1995, 250 fraudulent bankruptcies were being filed daily."

As a result in October 1995, a time when bankruptcy cases were beginning to approach one million per a year, Attorney General Janet Reno issued a memorandum stating, "The potential for fraud and abuse in a system involving such enormous amounts of money and complex financial transactions is great." As a result, the Department of Justice made the prosecution of bankruptcy cases involving fraud a top priority launching Operation Total Disclosure, which focused on the prosecution of bankruptcy cases involving defendants who illegally concealed assets, filed fraudulent bankruptcy petitions, or otherwise abused the bankruptcy system. On February 29, 1996, Reno announced the indictment of 127 defendants under Operation Total Disclosure for their involvement in bankruptcy crimes between December 1995 and February 1996. Based upon the success of Operation

Total Disclosure, the Department of Justice will continue the intensified prosecution of bankruptcy cases involving fraud.

## defective products

ACCORDING TO CONSUMER groups and the government agencies that are responsible for protecting Americans from defective products, more than 23 million defective products are likely being used by consumers in the United States alone. These products are considered defective because they have the potential to seriously injure or kill the users. The word "defective" is generally understood to mean imperfect or faulty.

The true extent of injuries and deaths that can be attributed to defective products cannot be reliably known, but experts agree that far more people are injured and killed from defective products each year than from all street crimes combined. Murder kills approximately 16,000 people per year and violent street crimes cause physical injuries to less than 1 million. The most common violent street crime is assault, which typically does not lead to any serious injury requiring hospital treatment.

It is known that even though more than 1,000 products are recalled each year, more than 20,000

people in the United States are killed annually by defective products. This number is understood to represent the minimum killed by defective products, for it excludes the 440,000 who die each year from tobacco-related illnesses, the more than 100,000 who die from adverse reactions to legal and approved drugs, the approximately 90,000 who die from eating high-fat diets (including large amounts of fast food products), and the 60,000 who die each year due to toxic chemicals.

An estimated 30 million Americans are injured by defective products, as well. For example, nearly 200,000 children require emergency-room care for toy-related injuries, and more than 2 million people suffer from serious reactions related to approved drugs. The Centers for Disease Control and Prevention (CDC) estimates that food-borne diseases, caused by pathogens such as listeria, salmonella, and toxoplasma, lead to more than 75 million illnesses, 325,000 hospitalizations, and 5,000 deaths every year in the United States. The total cost to American society attributable to injuries, deaths, and property damage caused by defective products is estimated to be more than \$500 billion every year. The direct costs of all street crimes combined is thought to be less than \$20 billion per year.

#### TYPES OF DEFECTIVE PRODUCTS

Consumer protection agencies, such as Consumers Union, provide information on recently recalled products. The frequency with which products are recalled is simply stunning, and includes hundreds of cars, sports utility vehicles (SUVs), trucks and vans, and children's toys, dozens of appliances, lawn products, car seats, electronic devices, home improvement and home furnishing products, as well as several types of foods and beverages, drugs and health products, some household products such as automatic garage-door openers, and ironically, some safety products such as gun-trigger locks, carbon-monoxide and smoke detectors. Some defective products even involve those aimed at protecting police such as some bullet-proof vests, as well as some devices meant to protect society from criminals, such as electronic monitoring bracelets.

Tobacco use is the leading cause of preventable death in the United States, making cigarettes the most commonly recognized defective product in the United States, if not the world. Simply stated, cigarettes, a delivery device for the addictive drug of

nicotine, contain thousands of chemicals and more than 40 known and suspected carcinogens. Cigarettes are considered defective products by many because they kill and cause illness when used properly.

Studies of tobacco activities and internal documents of tobacco companies show that major tobacco corporations purposely misled the public and Congress for more than 40 years about the dangers of smoking cigarettes; they intentionally marketed to children and adolescents through product advertisements in magazines and on television; they increased the addictiveness of their products through adding nicotine and chemicals that heightened the effects of nicotine; they attacked and attempted to discredit anti-smoking advocates and whistleblowers; they lied under oath to Congress when asked about the addictiveness of their products; they financially coerced companies making smoking-cessation products; and they even intentionally funded and produced faulty science through their own Tobacco Institute to cloud the significant issues. While all this was going on, hundreds of thousands of Americans died every year from using the defective products manufactured and sold by tobacco companies.

In the late 1990s, major tobacco companies entered into a financial agreement with states to pay hundreds of billions of dollars in compensatory damages to states over dozens of years. The money was to be used for various purposes, including preventing youth smoking; in reality, the money has been used by states for various costs completely unrelated to smoking as they struggle with large deficits. Tobacco companies subsequently raised their prices and passed the costs on to their customers. Civil juries in some states have found tobacco companies liable for reckless disregard for human life, outrageous conduct, negligence, misrepresentation of the facts, fraud, and even selling a defective product.

Although food may be considered nature's products, the processing of food is definitely a corporate activity that can introduce defects into nature's supply. As for specific kinds of foods, meat was considered very unsafe before the 1970s despite several federal laws requiring safety and inspection standards. Even today, meat inspectors are understaffed and meat plants are only rarely inspected. In the late 1990s, the federal government declared that *e. coli* bacteria was an epidemic because it was so

widespread in the nation's meat. Part of the reason bacterial infections of meat are so common is because of how the meat is processed. Meat-packing plants run at a very fast and unsafe speed, increasing the risk of disease spreading from fecal matter and stomach contents of the animals to the carcasses. The speed of the assembly line also contributes to thousands of injuries of employees every year.

Automobiles are frequently found to be defective in one of two ways: first, there are design defects that are discovered by corporations and not fixed; second, corporations routinely resist safety devices until forced to adopt them by public demand. Examples of the latter include resisting putting in safety windshields and air bags. Yet, the most well-known case of a defective product involved a car that was known by its manufacturer to be defective but was not recalled to save the company money.

#### DEFECTIVE EXAMPLES

Perhaps the most well-known case of a defective product is the Ford Pinto. This automobile was manufactured in the 1970s despite the findings of pre-crash tests which showed that Ford knew of ruptured fuel lines being caused by rear-end collisions. Ford learned that it would cost \$11 per car to fix the automobiles but calculated that it could save \$87.5 million by not fixing the cars. This was based on the assumption that hundreds of people would be killed and injured and thousands of cars burned at minimal costs to the company. Ford underestimated the prevalence of the crashes and the size of the civil judgments against it.

More recently, the Firestone fiasco, as it has been called, led to dozens of deaths as consumers died when their Ford Explorers rolled over after their under-inflated Firestone tires exploded. Ford Explorers, like other SUVs with a high center of gravity, are prone to rollovers, whereas Firestone tires when under-inflated are prone to tread separation. The combination lead to deadly results. As claims were being investigated by the National Highway Traffic Safety Administration (NHTSA) and as a recall finally was issued and slowly implemented, deaths continued to occur.

Chief executive officers of both Ford and Firestone denied any wrongdoing or fault, and each pointed the finger at the other. Firestone tires on Ford Explorers were replaced in more than 10 other

countries almost two years earlier than in the United States, and the Ford Explorer was subsequently redesigned for "a smoother ride."

Internal company documents show that executives were aware of the problems and kept them secret, and that it took years for the problems to finally come to light. This is typical in defective products cases, including other automobiles such as General Motors (GM) approved conversion vans that become deadly when steel roofs are removed.

Other automobile deficiencies include defective seat belts and seat-belt buckles in some GM and Ford cars; faulty back-door latches in Chrysler minivans that open when struck from the rear or side and cause passengers to be thrown out on to the street; and GM side gas tanks located on the side of trucks outside of the protective frame that easily rupture when struck from the side. This latter product has caused more fatalities than any other defective vehicle.

In 1992, NHTSA asked GM to voluntarily recall pickup trucks with such gas tanks. GM refused and the Department of Transportation secretary found in 1994 that GM knew about the defect since the 1970s. GM entered into a deal with the Department of Justice to avoid a recall and has paid hundreds of millions in settlements to victims instead. Thousands of these vehicles are still on the road.

Another well-known case of a defective product is the Dalkon Shield, an intrauterine birth-control device inserted in millions of women in the 1970s. This device was dangerous because it allowed bacteria to enter the uterus, causing spontaneous and septic abortions, birth defects, and even deaths of women. The company which manufactured the product knew about it yet did not repair the product, replace it, or stop advertising it to women.

Another well-known device implanted in women is the silicone breast implant. The Food and Drug Administration (FDA) stated that the safety of these products was unknown even though they were already being used. Documents show that scientists worried about the safety of these products, and that the manufacturer had evidence of the ruptures that allow silicone to leak into the body causing serious illness long before such ruptures were widespread in the 1990s.

Similar claims were verified against the makers of the Rely tampon in the 1980s, which was found to lead to toxic shock in women who used them. Toxic shock produces fever, rashes, skin peeling,

low blood pressure, respiratory distress, shock, and even death.

With the exception of Ford, which was acquitted at trial in the Pinto case, the makers of each of the above products were ordered by courts to pay billions of dollars to compensate victims. No one went to jail or prison.

#### EFFORTS TO PREVENT AND CONTROL

The Consumer Product Safety Commission (CPSC) is an independent federal regulatory agency that conducts research on products to determine which are hazardous. The CPSC also develops voluntary standards with industry, issues and enforces mandatory standards for product safety, bans consumer products that are proven unsafe, and informs consumers of product safety recalls and issues. It was created by Congress in 1972 to protect the public "against unreasonable risks of injuries associated with consumer products."

In 2003, the CPSC employed only 480 employees, which were responsible for monitoring the safety of more than 15,000 kinds of consumer products. Like most regulatory agencies, the CPSC has fewer employees and less money than in the past, because of deregulation of businesses by Congress in the 1980s.

The agency does not test products, nor recommend products, nor investigate any claims with regard to automobiles and vehicles, tires, boats, alcohol, tobacco, firearms, food, drugs, cosmetics, pesticides, or medical devices (these are the domain of other regulatory agencies, including the NHTSA, the U.S. Coast Guard, the FDA, and the Bureau of Alcohol, Tobacco, and Firearms (ATF)). The CPSC also does not investigate false advertising, fraud, or poor product quality unrelated to safety (this is the domain of the Federal Trade Commission, FTC) or claims dealing with work-related incidents (this is the domain of the Occupational Safety and Health Administration, OSHA).

The CPSC has more than 300 voluntary standards to be followed by business, plus about 50 mandatory regulations, and has a Disclosure Rule which requires that product manufacturers report defective products as soon as they are discovered if they pose threats to consumers. The key point is that most of their safety standards are voluntary and corporations are essentially allowed to police themselves.

NHTSA is part of the U.S. Department of Transportation and was created in 1970. It is the agency charged with reducing deaths, injuries, and economic losses resulting from motor vehicle crashes. NHTSA sets and enforces safety performance standards for motor vehicles and automobile equipment, and it investigates safety defects in motor vehicles. This agency also provides consumer information on motor vehicle safety topics, grants funds for state and local governments to assist them with conducting local highway safety programs, sets and enforces fuel economy standards, promotes the use of safety belts, child safety seats, and air bags, and conducts research on driver behavior and traffic to suggest safety improvements.

The FDA was created under a different name in the early 1900s and became known as the FDA in 1930. Its main responsibilities include ensuring the safety of food, cosmetics, medicine and medical devices, and some products such as microwave ovens. It also oversees feed and drugs for pets and farm animals. In 2003, the FDA employed more than 9,000 employees who were responsible for visiting more than 16,000 facilities annually.

Like NHTSA, the FDA operates mainly by voluntary recalls, but it also can, by court-order, force defective products from the market. The specific products it regulates include biologics (such as blood supply), cosmetics, radiation-emitting products (such as microwaves), and food products (except for meat and poultry which are regulated by the Food and Safety Inspection Service of the U.S. Department of Agriculture).

#### WORTHLESS OR DEFECTIVE

Thousands of products which claim effectiveness for numerous ailments are sold over the counter and contain statements such as "these claims have not been evaluated by the FDA." One may wonder how many of these products have any worth at all. Such products are not typically considered defective except that they do not work as advertised. According to scholars, worthless products cost Americans approximately \$25 billion per year.

There are, in fact, entire industries built on fraudulent claims (for example, products that remove the appearance of cellulite and wrinkles, enlarge the penis, whiten the teeth, produce rapid weight loss, etc.). Some of these products have been shown to be not only ineffective but dangerous.

Regulatory agencies in the United States are understaffed and have great difficulty regulating the products within their jurisdictions. Essentially, regulatory agencies, such as the FDA, operate under the assumption of *caveat emptor*, or let the buyer beware. The burden rests on the consumer to avoid being injured or killed by defective products.

Because of deregulation by government of businesses that manufacture most products consumed, the sheer volume and variety of defective products is alarming. Manufacturers and distributors of these products also play significant roles. One example concerns the Ford Pinto. Ford executives met with President Richard Nixon in the early 1970s and asked the president not to issue an upgrade to the fuel tank standard that would have caused Ford to redesign its car. NHTSA didn't issue the new standard until 1974, and only after it was pressured from Congress, and the new rule did not take effect until 1977.

Congress has passed legislation aimed at strengthening reporting requirements of corporations to regulatory agencies, but since there is no corporate police force, the American people are counting on the corporations to be honest in policing themselves.

#### CLAIMS MAKING BY MANUFACTURERS

Corporations that make consumer products have claimed in court that complying with federal product standards ought to provide a valid defense to criminal and civil charges related to claims of defective products; that is, businesses consistently claim that meeting minimum standards for product safety is sufficient.

Generally, this claim has been rejected, although companies have put pressure on Congress to accept so-called tort-reform legislation which would make it harder for injured plaintiffs to prove their cases because of such a defense. In fact, dozens of legal drugs, cars, trucks, SUVs, automobile safety features, and other products, meet federal safety standards but are still unreasonably dangerous. This is, in part, due to the fact that many product safety standards are outdated and minimal to begin with.

In the case of the Ford Pinto, it complied with minimal federal standards for safety (which dealt with front crashes) but was recalled after standards were expanded to rear crashes. The Ford Capri, sold at the same time in Europe, was designed to pass a

higher level of protection than the Ford Pinto. Its gas tank was located above the rear axle for years before American regulations required this placement in the Ford Pinto.

Ironically, modern studies of automobile collisions show that there are still minimal standards for post-collision fires and for impact resistance at some crash angles; automobile manufacturers know about these risks and work diligently to resist making changes to their cars. Hundreds of people die and thousands are injured every year in automobile crashes that could be prevented by tougher crash standards that are resisted by almost all automobile designers and manufacturers.

It has been alleged that other products, including some intended for the most vulnerable consumers such as children's safety seats, are defectively designed, shoddily manufactured, and inadequately tested by regulatory agencies. Similar claims have been made against some baby cribs. Such products produce thousands of deaths and hundreds of thousands of injuries annually in the United States.

As with the Ford Pinto, in many alleged cases of defective products, we consistently see attempts by corporations to withhold information from the public and to minimize potential harms posed by their products. It is also common for corporations to arrange secret settlements with victims that prevent other consumers from protecting themselves against defective products, and to delay payments when settlements are reached.

The dangers of defective products cannot be understated. Often, even after a recall, products end up back in the hands of additional consumers because they are resold by unknowing customers rather than being destroyed.

## defense industry fraud

THE DEFENSE INDUSTRY comprises the development, production and sale of weapons and weapons-support systems. In some cases, components or substances that are not themselves weapons may be classified as being part of the defense industry if it is believed that they may be used in the creation of weapons. The defense industry is characterized by oligopolistic conditions, in which a small number of large firms compete for a small number of orders from governments. Success in the industry relies upon, to a considerable extent, economies of scale from research and development departments, large-scale production facilities and good network contacts with relevant government officials, both domestically and internationally.

Many overseas sales are characterized by corruption and bribery and Transparency International has listed defense, along with the public works and construction industry, as being the sectors in which bribery is most rife. The very high value of products also provides an incentive for dishonesty, and the scale of the industry means that it retains a degree of momentum that is unlikely to be stopped by the pressure of external forces. That momentum was apparent at the Defense Systems and Equipment International (DSEi) exhibition which continued in London during, and for several days after, the September 11, 2001, terrorist attacks against the United States.

### VARIETY OF FRAUDS

Incidences of fraud in the defense industry fall into the following categories:

*Illegal sale or supply of arms.* Illegal sales include arms-producing equipment to states under sanctions or otherwise in contravention of international trade laws. Well-known examples of this include the export sale by the United Kingdom (UK) company Churchill Matrix of components designed to create a Super Gun for Saddam Hussein's regime in

Iraq; similarly, the Iran-Contra affair involved the complex exchange of arms for hostages in Iran and Nicaragua, which remains an operation in which the culpability of various members of President George W. Bush's cabinet remained contested.

*Bribery.* This kind of activity involves bribing officials to make arms purchases which are uncompetitive or else unnecessary. Repeats of sales in the Persian Gulf by UK firms reveals that bribery is considered an essential aspect of doing business in this industry. The notorious Al Yamamah arms sale has been the subject of a number of lurid allegations, including bribery, the provision of prostitutes, and other immoral and illegal inducements. This is not the only example, as related deals, some with the alleged involvement of senior politicians of the UK government, also featured bribery and diversion of public moneys together with the unnecessary purchase of arms equipment.

*False records.* This kind of defense industry fraud involves government officials purchasing in ways that enrich themselves rather than in the public interest, or else falsifying public records to hide the extent of arms purchases. This occurs in countries, such as Myanmar, in which the military government is faced with numerous allegations of human rights abuses and wishes to conceal its need to keep the populace in a state of fear.

*Collusion.* Too-close relationships between buyers and suppliers lead to accusations of collusion and purchase of influence. In the defense industry, this danger is especially prevalent in that the need for joint development of new products, as well as specialized strategic and weapons knowledge, makes the transfer of personnel between industry and government a common phenomenon. This relationship has intensified in the United States in the second half of the 20th century, and has come to be known as the military-industrial complex.

*Unlicensed trading.* This form of criminality involves the illegal trading in weapons by unlicensed people and organizations. Particularly in places close to war zones, areas with porous borders or in which previous militaristic regimes have been displaced, there may be large numbers of weapons in circulation and these may come under the control of criminal gangs who require them for their own activities, or who may trade them with terrorists, rebels or other groups willing to use violence to achieve their aims. Thailand, for example, is, unfortunately, an ideally placed country for an illegal

arms trade featuring materiel from Cambodia, Myanmar, Laos and with equipment still available from the U.S.-led war in Vietnam.

*Irrationality.* Illogical and possibly illegal purchasing procedures can result in needless expenditure on goods and services. This has become particularly well-known as a result of exposures about activities within the U.S. government's Pentagon, which controls military expenditure, although the greater freedom of information in the United States probably hides the fact that such abuses occur in most countries. Problems with Pentagon purchasing policies became well-known as a result of Ernest Fitzgerald's book *The Pentagonists*, in which it was revealed that government would pay as much as 1000 percent mark-ups on simple items of equipment as a result of irrational policies.

Additional concerns relevant to the defense industry, but not directly related to fraud, include the unsafe testing of arms and the expropriation of territory both domestically and internationally to acquire testing grounds; the lobbying of governments by arms industry representatives with a view to persuade them to abrogate international agreements that might save civilian life (for example, land mines) or otherwise becoming unduly involved in the political process; making products knowing that they may not conform to standards of international law, and more general abuse issues.

## THE LEGAL SITUATION

The defense industry, and weapons-trading generally, are regulated by a number of international laws. These include, in the case of the transfer of arms with the knowledge that they may subsequently be used in ways not damaging to humanitarian practices or serious violations of international human rights, Chapter VII of the United Nations Charter, Common Article 1 of the 1949 Geneva Convention, and Draft Articles of the International Law Commission.

In the event of the misuse of weapons by private individuals when the state has failed to exercise due diligence, relevant regulations are applied by the European Court of Human Rights, Article 6 of the International Covenant on Civil and Political Rights, and Article 3 of the Universal Declaration of Human Rights.

Unfortunately, as of early 2004, it appeared that the world generally is moving away from multilater-

alism and the observance of global legal agreements. The withdrawal of the United States from a number of important international treaties, the collapse of World Trade Organization talks, and international tensions arising from the War on Terrorism, among other developments, suggest that the ability of individuals or of governments to apply the international legal system to regulate the defense industry will not be stronger in the future.

In the United States, the defense industry has realized these difficulties and have taken steps to reduce improper practices. In 1985, President Ronald Reagan appointed David Packard, chair of the Hewlett-Packard Corporation and a former deputy secretary, to chair the independent Commission on Defense Management. The commission was charged with reviewing procurement, budgeting and operating procedures within the U.S. defense system, and with making recommendations for improvements to that system.

The commission preferred to recommend a system of self-regulation rather than governmental control, which was a finding consistent with the conservative ideology of the Reagan administration. Defense contractors were, therefore, required to develop and implement codes of ethics that addressed the issues of the industry.

Defense contractors met subsequently and adopted industry standards that covered such issues as codes of ethics, internal reporting of possible wrongdoing procedures, self-governance mechanisms and responsibility to the public. This came to be known as the DII (Defense Industry Initiative) Principles. Inevitably, the DII Principles have been examined in court and modifications have been made. They have also been refined through a series of forums and workshops at which leading defense industry executives have been in attendance.

Further, the appointment of Packard and the acceptance that self-regulation would provide an adequate means of ensuring the industry remained appropriately controlled have been widely criticized as representing the surrender of authority from government to industry.

## FUTURE PROSPECTS

The changing nature of foreign policy means that weapons and weapon systems sold today, in what appears to be good business practice, can become unfortunate or even criminally negligent tomorrow.

For example, British troops came under fire from French Exocet missiles in the Falklands War, missiles sold to Britain's enemy, Argentina, a few years before. Another, more forceful example, is the American arming of Muslim extremists in Afghanistan to resist Soviet troops who had invaded. This policy appeared less coherent when the extremists then formed the Taliban government in Afghanistan which helped to enable the rise al-Qaeda terrorists. Moreover, attempts to enforce an ethical foreign policy can founder as a result of the need to sustain jobs, skills and competencies in a high value-added industry of considerable strategic importance.

It appears that future advanced weapons systems will continue to be increasingly capital- and research-intensive. This continuing development in the military-industrial complex is likely to represent a continuing trend concentrating production into a small number of advanced firms, possibly with cross-border governmental support, as in the case of the European Union, and rivaled by new and emerging regional groupings.

## differential association

DEVELOPED BY criminologist Edwin H. Sutherland, differential association theory has been one of the most long-lasting sociological and criminological theories of our time. Sutherland described his differential association theory in his book, *Principles of Criminology*, published in 1939.

The theory's popularity, in part, stems from its simplicity and straightforwardness. In particular, his views on the causes of crime can be found in the nine propositions he described:

1. Criminal behavior is learned
2. Criminal behavior is learned in interaction with other persons in a process of communication
3. The principal part of the learning of criminal behavior occurs within intimate personal groups
4. Learning criminal behavior includes learning the techniques of committing the crime, which are sometimes very complicated and sometimes very simple, and learning the specific direction of motives, drives, rationalizations, and attitudes
5. The specific direction of motives and drives is learned from perceptions of various aspects of the legal code as being favorable or unfavorable
6. A person becomes criminal when he or she perceives more favorable than unfavorable consequences to violating the law
7. Differential associations may vary in frequency, duration, priority, and intensity.
8. The process of learning criminal behavior by association with criminal and anti-criminal patterns involves all of the mechanisms involved in any other learning
9. While criminal behavior is an expression of general needs and values, it is not excused by those general needs and values since non-criminal behavior is also an expression of the same needs and values.

Differential association theory suggests that criminal behavior is learned through the process of communication in small groups. Sutherland noted that individuals need to learn strategies to commit crime and reasons to commit crime. With this assumption as a framework, Sutherland argued that individuals will learn definitions of laws as favorable or unfavorable. Those who think laws are fair will be more prone to abide by the laws, while those

who see them as unfair will be less prone to engage in appropriate acts.

In addition to one's perceptions about laws, Sutherland also pointed out that the same learning process that is used to learn conventional behavior is used to learn criminal behavior. For example, individuals use the same process to learn how to use a computer for their job that computer criminals use to learn how to use a computer to perpetrate a crime. He also believed that criminal behavior is not caused by needs or values, because all behavior stems from needs and values.

Although Sutherland developed his theory to explain all criminal behavior, he took several opportunities to illustrate how his theory explains white-collar crime. Consider the following comments from Sutherland (1983):

White-collar criminals, like professional thieves, are seldom recruited from juvenile delinquents. As a part of the process of learning practical business, a young man with idealism and thoughtfulness for others is inducted into white-collar crime. In many cases, he is ordered by managers to do things he regards as unethical or illegal, while in other cases he learned from those who have the same rank as his own how they make a success. He learns specific techniques of violating the law, together with definitions of situations in which those techniques may be used.

Elsewhere, Sutherland quoted a shoe salesperson who learned the rationale for selling misfitting shoes from his manager: "[The manager told the salesperson] my job is to move out shoes and I have you to assist in this. I am perfectly glad to fit a person with a pair of shoes if we have his size, but I am willing to misfit him if it is necessary in order to sell him a pair of shoes. I expect you to do the same. If you do not like this, someone else can have your job. While you are working for me, I expect you to have no scruples how you sell your shoes."

This quote from Sutherland epitomizes his theory. The salesperson learned how to commit the misdeed and why to commit the misdeed. Sutherland's theory has withstood the test of time and the scrutiny of sociologists and criminologists. Several tests have supported the assumptions of the theory, but the fact that it is difficult to test the specific assumptions set forth by Sutherland has been levied

as one of the common criticisms of differential association theory. Still, the research and policy implications that have evolved out of his theory is a testament to the theory's importance and strength.

## direct-mail fraud

**ALSO KNOWN AS** direct marketing, direct mail is a form of advertising in which companies send large numbers of printed mailers, generally numbering in the millions per campaign, through the U.S. Postal Service or another mailing venue to potential customers. Direct-mail fraud results when a deceptive or misleading offer is sent to consumers via a mass mailing that causes the consumer to remit money for a product or a service with unwarranted or false expectations.

In a 1999 United States General Accounting Office report, the Federal Trade Commission (FTC) defined mailed material as deceptive, "if the material included a representation or practice or if the material omitted information that caused a consumer to be misled and eventually suffer some loss or injury, despite the fact that the consumer behaved reasonably under the circumstances."

In recent years, the scope of understanding of direct-mail fraud has expanded to encompass other methods of mass mailing, such as faxes and bulk mailing using e-mail addresses, also known as spamming. The practice of using fax for mass mailing is closely related to direct mail in its potential for fraud and other problems; only the venue for distributing the mailing is different. But mass mailing to e-mail accounts is exponentially more hazardous when the claims in the e-mail are in some way deceptive or misleading, because of the great numbers

of people that can be reached in a short period of time, and the speed at which these kinds of false claims can have an effect.

Statistics about direct-mail fraud and its impact on consumers reveal that it has a broad effect at all levels of contemporary American society; indeed it might be argued that it is the most likely form of business fraud to have a measurably damaging effect on consumers. Consumer concerns and complaints are usually submitted to the FTC and/or the Postal Inspection Service of the U.S. Postal Service. Both organizations are active in combating direct-mail fraud; the FTC is responsible for fair trade practices and the Postal Service is usually the vehicle for the fraud.

### PROJECT MAILBOX

In yearly investigations of direct-mail fraud, dubbed "Project Mailbox" and which began in 1997, an oversight organization formed from the FTC, the Postal Inspection Service, the Securities and Exchange Commission (SEC) and the National Association of Attorneys General (NAAG) identified the greatest number of illegal activities as deriving from deceptive sweepstakes and prize promotions, with travel, investment, and various other scams following in that order.

In 1999, at the behest of the U.S. Senate, the General Accounting Office launched an investigation of deceptive mailing practices. It conducted its own surveys as well as used the evidence collected by the FTC and the Postal Inspection Service. The evidence strongly supported lawmakers and consumers' perception that direct-mail fraud was widespread, and suggested that its effects differed according to social or economic status. In the six months prior to the survey, 51 percent of those questioned had received a sweepstakes promotion or look-alike cashier's check that was misleading or deceptive.

The higher the education levels of the person surveyed, the more likely they were to assert that they had received deceptive mail. Of respondents with a college degree or higher, 62 percent indicated that they had received such mail, while 56 percent of respondents with some college education indicated that they had, and only 43 percent of respondents with high school education or less believed that they had received deceptive mail. Similar variations in response were reported by those with

different income levels, with respondents having higher income more likely to report that they had received a deceptive or misleading mail offer.

### SWEEPSTAKES

The majority of instances of direct-mail fraud occur with sweepstakes offers. A sweepstakes is a promotion that a consumer may enter through the mail in hopes of winning a prize, which is usually money. The use of direct-mail sweepstakes offers is a legitimate business marketing practice; it is intended to generate publicity and excitement about a product.

For example, magazine subscriptions are often touted using sweepstakes. By law, purchase of the product associated with the sweepstakes offer is not necessary to enter the contest. Though there are legitimate sweepstakes offers from organizations that do award prizes, lawmakers and consumers have strenuously objected in the past to the wording of the mailings even of these legitimate contests. It is not always made clear in the advertising material what the odds of winning the contest are, and that purchase of the products advertised does not increase the odds of winning.

The letter may indicate, for example, that the consumer has "already won," though the "winner" will discover only after reading the small print that this is not actually the case. The mailed material may also suggest that the consumer pay an extra fee for "expedited processing," and indicate that "winners usually do buy" the product advertised. The deception is in the implication that either of these tactics will increase the consumer's chances of winning the contest, which they will not.

In addition to such misleading language, the direct-mail sweepstakes industry is plagued by small, fly-by-night companies that engage in fraudulent and deceptive business practices. For example, companies may claim to be running a contest but do not in the end, after collecting entries and money actually, offer any prizes. In many of these sweepstakes offers, the information provided regarding the product to be purchased is also deceptive.

A common product is a "cash folio." This product description is misleading, because the product is in reality a coupon book that likely will have very little cash value for consumers who may not need the items that can be redeemed with the coupons. In addition, the coupons require even more outlay of

money by the consumer. Consumers who purchase these cash folios likely are motivated not by the attractiveness of the product, but rather by deceptive language in the mailing that implies that purchase of the coupon book will increase the odds of winning the sweepstakes. These sweepstakes companies may also use a number of different names to promote the same contest. For example, customers may receive three different mailings under three separate corporation names, and are misled into thinking that they are entering three separate contests when it is, in reality, only one contest with only one set of prizes.

### UNCLAIMED PROPERTY

Charging consumers for otherwise free government services is another common variety of fraud perpetrated through direct mail. A consumer may receive a mailing that lists for the return address a seemingly official name, such as “State Property Division.” The inside material then describes “unclaimed property” belonging to the recipient that can be retrieved for a fee. This claim is misleading both in the implication that the company is somehow official or a governmental unit, and second in its claim that money must be sent to retrieve unclaimed property, because state governments do not charge for this service. These government look-alike mailings are often targeted toward the elderly, because this demographic may be easily confused by government-alike company names.

Direct-mail fraudsters also take advantage of the intimidation many elderly consumers feel when navigating the bureaucracy of government programs, such as Social Security, and suggest in their direct-mail material another route for reaching government offices that seems simpler. For example, a mailing may suggest that the consumer call to obtain Social Security information using a 900 number, and not reveal that a call to a 900 number is a very expensive toll call or that the government would never charge to make this information available to consumers.

### SCHEMES AND SCAMS

One kind of direct-mail fraud incites further fraud. Ever-popular envelope-stuffing schemes advertise that consumers may work at home and have the freedom of being their own boss. Interested cus-

tomers remit a fee to the company allegedly for equipment; it is usually very expensive. In these fraudulent offers, it is implied that the consumer can then stuff envelopes at his or her leisure and sell them to companies. But it is often the case that dishonest companies send nothing in return for the customer’s fee, or simply send instructions for beginning an envelope-stuffing business. Alternately, the consumer may be sent material with instructions for how to send out more envelope-stuffing offers, perpetuating the direct-mail fraud by using unsuspecting consumers.

E-mail provides a convenient venue for the rapid dissemination of direct mail, and not surprisingly e-mail direct marketing, as with traditional direct-mail marketing, has been vulnerable to fraudulent offers and claims. One such direct-mail fraud was conducted under the name AOL Investment Snapshot—a name intended to suggest (falsely) that the company was tied to the legitimate company, America Online. The e-mail, an investment scam, recommended the purchase of particular penny stocks. The stocks were, as a result, driven higher in value in that day’s trading, and the stock promoter who sent the e-mail benefited by selling his stocks.

The speed with which direct e-mail marketing may have an effect has its danger in the rapidity in which fraudulent activity can be executed. For example, an e-mail sent under a disguised name may send a stock price soaring, during which time the promoter sells her stock and cashes out. The fraud need not take more than a couple of hours and is difficult to track. This kind of manipulation of stock prices for financial gain through direct e-mail marketing is prosecuted by the SEC, which is responsible for ensuring the integrity of financial markets.

Other deceptive practices involving direct mail include loan solicitations (“payday advances” that fail to clearly indicate membership fees, high cash-advance fees, and that advances can only be used for the business’s catalogue shopping); insurance scams; and offers to help consumers patent their inventions. Another common form of direct-mail fraud involves checks that look real, and that consumers mail in with a processing fee in the hopes of obtaining a real check. Vacation scams are another form of direct-mail fraud. In these cases, the customer is offered a free vacation, but when she contacts the company to redeem the vacation, she is

informed of fees generally totaling several hundred dollars, or it is revealed that attendance at a time-share sales presentation is required. And it is not just regular consumers who are victimized by direct-mail fraud: businesses can also be targets of fraud, for example with "Yellow Pages Invoices" that ask for payment to "renew" listings in business directories that are not distributed to the public or associated with the local telephone directory.

Companies that commit direct-mail fraud often target particularly vulnerable consumers, such as the elderly. Senior citizens may be less diligent or watchful about the kinds of programs in which they will participate, and may be more easily confused about misleading claims made in direct mailings. Direct-mail fraud is an exponential problem for victimized consumers, because once they purchase a product through a fraudulent sweepstakes offer or otherwise send money as a result of a deceptive direct mail pitch, they are re-solicited again and again by the same company. The names and addresses of consumers who have been shown to be receptive to mail sweepstakes or other offers are also sold to other direct-mail companies.

## OVERSIGHT AND PROSECUTION

It has been difficult in the past to prosecute businesses that engage in direct-mail fraud. One barrier is that jurisdiction usually belongs to individual states, and differing laws and regulations mean that investigation and prosecution practices are not uniform from state to state. Also, companies that engage in direct-mail fraud have strategies to avoid authorities. They may only set up a bare-bones operation so that they can close up at the first sign of investigation; move from state to state to avoid prosecution by attorneys general in particular states; and operate different mailboxes in different jurisdictions.

By the time a consumer files a complaint against a company that has perpetrated direct-mail fraud, the company will likely be in another state and operating under another name. Direct-mail fraud is also difficult to prosecute because it requires consumer complaints, often by consumers who must admit that they have been taken in by misleading or deceptive claims.

Direct-mail businesses have an industry oversight group that works to educate businesses about criminal activity, the Direct Marketing Association.

It is a nonprofit trade organization, established in 1917, meant to advise its members on practices in the direct-marketing business. Because fraudulent offers taint the reputation of all direct-mailers, it is crucial to the business of the legitimate companies that they eradicate fraud. The DMA recently issued nine guidelines for e-mail marketing to attempt to improve the integrity, accuracy, and reputation of this much-maligned practice.

In February 1999 the NAAG met to strategize how to combat sweepstakes fraud. The NAAG recommended the following voluntary guidelines for the direct-mail sweepstakes industry: 1) the odds of winning must be clearly disclosed; 2) there should be no implication that purchase of a product increases the chances for winning; 3) there must be a simple and uniform way to enter the contests both for consumers who purchase products and those who do not.

The FTC has focused on education of consumers, using catchy slogans such as "Catch the Bandit in the Mailbox" to help alert consumers to potential fraud. In July 1998, the FTC named a Dirty Dozen, twelve scams that were disseminated to the public using bulk e-mail. The fraudulent activities described in the FTC's Dirty Dozen were not necessarily new; rather it was the venue that was new and the number of consumers that could be reached and deceived by these scams in a short time. In addition, the FTC established a toll-free hotline (1-877-FTC-HELP), and used its website ([www.ftc.gov](http://www.ftc.gov)) to make information available to the public about deceptive mailings.

Various states have also undertaken measures to protect consumers from direct-mail fraud. The Colorado Sweepstakes and Contests Law, passed in 2000, mandates that sweepstakes companies reveal the odds of winning and prohibits them from indicating that the recipient is specially selected or has already won a prize.

These educational and enforcement initiatives culminated in federal intervention. Congress took action against direct-mail fraud in 1999 with the passage of the Deceptive Mail Prevention and Enforcement Act. It prohibits mailings that use names that suggest that the company is associated with the U.S. government or Postal Service or otherwise misrepresent the true identity of the mailer, as well as mailers that mislead the consumer by suggesting that government services will be affected by purchase of a product. It also has particular disclosure

requirements for sweepstakes offers, contests, and look-alike cashiers' checks. Broader authority was given to the U.S. Postal Service to stop deceptive mail and to pursue offenders.

The Free Speech Coalition (FSC) objected to this legislation on behalf of businesses that use direct mail with fair and honest business practices, particularly nonprofit organizations that rely heavily on direct mail for fundraising. The FSC registered concern that the new legislation increases too dramatically the enforcement power of the Postal Service. The FSC notes that it allows the Postal Service to use its own discretion to determine which mass mailing material is appropriate, and to immediately stop any item that it deems inappropriate. If mistakes are made by the Postal Service with regard to legitimate mail being stopped, the damage will have already been caused to the business of the organization. The FSC also claims that the new legislation will deny direct mailers due process by allowing the Postal Service (itself a business) to levy fines.

Also a problem, according to the FSC, is the intervention of the federal government at all in a business that is already heavily regulated by states and local governments. Direct-mail organizations argue that prosecution of fraud within their industry must be done at a level that targets only companies that engage in dishonest practices, without destroying or unnecessarily limiting the direct mail advertising of legitimate companies.

## Domhoff, G. William (1936–)

G. WILLIAM Domhoff is a retired research professor at the University of California, Santa Cruz, who continues to write about his interests in both psychology and sociology. In psychology, his focus is the scientific study of dreams. However, this prolific social scientist's most prominent contribution can be found in sociology, specifically in the area of the power structure in the United States.

Domhoff's perspectives about power relations in society can be traced to the work of economist Paul Sweezy, political scientist Robert Dahl, sociologists E. Digby Baltzell and Floyd Hunter, and especially the maverick political sociologist C. Wright Mills. From Mills, Domhoff borrowed the concept of the power elite, a ruling group who controls power in society by dominating the business, military, and governmental institutions. In Domhoff's conception, however, the elites are a cohesive group of people from the top social and economic strata in America.

Domhoff began his thesis with *Who Rules America* in 1967, a work that became a pioneering landmark in political sociology. The power elite, according to Domhoff's conceptualization, is a homogenous unit whose high level of cohesion can be traced to attendance at prestigious preparatory school and Ivy League institutions, membership in higher social circles and elite clubs, similar recreation patterns, and a common world view. The power elite maintains this cohesion despite the "antagonisms" of varying religious and ethnic backgrounds, political affiliation, and the dichotomy of old-versus-new money. This group, the seat of power in the United States, exerts an enormous influence on the business sector, the government, and various regulatory agencies.

After an elaboration on this theme in other works that focused more on the issue of upper class domination, Domhoff published an often cited study of upper class social clubs (which he called "watering holes"), the Bohemia Grove club, the

G. William Domhoff co-authored *Diversity in the Power Elite*, which explores the issue of diversity in American society as it relates to entrance into the circles of the power elite.

Rancheros Visitadores (visiting ranchers), and the Roundup Riders of the Rockies. In this work, *The Bohemian Grove and other Retreats*, he posited that clubs that focus on recreation also play a pivotal role in making the higher circles an elite and cohesive group.

From the 1970s onward, Domhoff completed a series of works that examine the power elite from the macro level of analysis he used in *Who Rules America*. These works focus particularly on the issue of how the political landscape is molded by the power elite. Along with Richard L. Zweigenhaft, Domhoff continued his exploration of power structure by including the variables of race in *Blacks in the White Establishment* in 1991, and a follow-up report *Blacks in the White Elite* in 2003.

Another recent work, *Diversity in the Power Elite*, explores the issue of diversity in American society as it relates to entrance into the circles of the power elite. Despite some major changes in upward social mobility by women and other minority populations, Domhoff and his colleague Zweigenhaft concluded that the new diversity created little change in the overall structure of the higher circles.

Domhoff continues to research aspects of power structure as well as his psychological interests. It is likely that, other than C. Wright Mills (and of course, Karl Marx), no other person has made more significant contributions to the study of class and power elitism than Domhoff.

## Dow Chemical

AS OF 2002, the Dow Chemical Company was one of the world's largest diversified chemicals and plastics companies with sales of \$27.6 billion, employing approximately 50,000 people worldwide. The company supplied more than 3,400 chemical and plastic products to 170 countries.

Dow achieved notoriety during the 1960s as a supplier of napalm and the defoliant Agent Orange to U.S. armed forces serving in Vietnam. The "Dow Shall Not Kill" campaign was central to the development of the anti-war movement in the United States. During the 1980s, American Vietnam veterans sought damages from Dow and other manufacturers of Agent Orange because they alleged exposure to dioxin in Agent Orange had adversely affected their health. Campaigners also pursued the company through the courts for dioxin contamination, and poisoning the Great Lakes with mercury.

After a merger with the Union Carbide Corporation in 2001, Dow assumed Union Carbide's liability for asbestos-related claims. The company estimates that the cost of resolving pending and future claims during the period 2002-17 will be between \$2.2 and \$2.4 billion. The company is also potentially liable for claimed defects in breast implants and other silicone medical products, personal injury, and property damage caused by some chemical pesticides containing dibromochloropropane (DBCP), and the remediation and restoration of polluted manufacturing sites.

Formed in 1897 by Herbert Dow, the Dow Chemical Company produced chlorine bleach from waste brine from the Midland Chemical Company plant, an early venture. By 1900, the company had absorbed Midland Chemical and was an established chemical producer by 1910. The outbreak of World War I removed German competition in the U.S. market, and Dow expanded into the manufacture of dyestuffs.

The company poured money into research to maintain market leadership when the German chemical industry revived during the 1920s. Several new products entered the company portfolio as Dow Chemical followed a policy of progressive organic growth.

The demands of the U.S. military during World War II boosted the company still further. The company also began to expand internationally, forming Dow Chemical of Canada in 1942. During the fol-

lowing decade the company entered the important Japanese and European chemical markets. The story of Dow as a growth company came unstuck in the late 1960s and early 1970s.

In the summer of 1970, Dow stumbled into another controversy when the attorney general of Ohio asked the U.S. Supreme Court for leave to bring an action against Dow for mercury pollution. In 1969, a Norwegian graduate student published a research paper showing that mercury deposited in the Great Lakes could accumulate in the bodies of fish as highly toxic compounds. People eating large quantities of mercury-tainted fish risked severe mercury poisoning. Like other chemical and paper companies, Dow Canada flushed mercury spilled at manufacturing sites around the Great Lakes into the nearest body of water, believing that the mercury sank to the bottom and remained inert.

The government of Ontario, Canada, had already instituted proceedings against Dow Canada for mercury pollution during the spring. When commercial fishing was suspended, fisherman made individual claims and class-action claims for loss of livelihood. In 1985, Dow Canada faced a similar scandal after a government diver reported discovering a blob of perchloroethylene, a dry cleaning fluid, while sampling sediments in the St. Clair River during 1984.

The Ontario Ministry of the Environment prosecuted the company for spilling perchlor. Dow Canada pleaded guilty and undertook to clean up the river. As of July 1998, Dow was a potentially responsible party for 38 sites on the Superfund National Priority List, the U.S. government's toxic clean-up program.

### QUESTIONABLE PAYMENTS

During the 1970s, Dow Chemical also struggled with mounting public concern about bribery and "facilitation payments" in the United States. The treasurer of the company appeared before the U.S. Senate Select Committee on Presidential Campaign Activities to inform them that 76 Dow executives made personal contributions to individuals on a list of political candidates favorable to company interests drawn up by the tax counsel.

Although Dow had not made illegal donations, the public outcry about illegal campaign donations and later revelations about U.S. companies bribing foreign government officials prompted Dow to con-

duct an internal investigation of questionable payments made by employees.

The investigation revealed that senior managers of Grupo Lepetit, an Italian-based subsidiary manufacturing pharmaceutical products, were making questionable payments to secure contracts. Dow stopped these facilitation payments and adopted a new company policy explicitly forbidding payments.

## AGENT ORANGE

Dow's problems caused by antitrust, environmental, and anticorruption legislation paled in comparison with the furor over Agent Orange. Between 1962 and 1971, the U.S. military sprayed Vietnamese forests with 20 million gallons of herbicide in an effort to kill unwanted plants and defoliate trees provided the Viet Cong and North Vietnamese Army with cover. Although the military used 15 different herbicides in Vietnam, over 80 percent of the herbicides sprayed were Agent Orange. One of the chemicals in Agent Orange contained traces of TCDD or dioxin. This impurity was linked with several types of cancer and other disorders.

Dow was the largest supplier of Agent Orange to the U.S. military, opening the company to personal injury claims from civilians and military personnel exposed to the herbicide. In 1969, the federal government restricted the use of Agent Orange to sparsely populated areas in the United States, and ceased using it in military operations in 1971. Dow refused to accept that there was a link between dioxin-contaminated Agent Orange and cancer. However, stringent regulations made the business unprofitable for the company which mothballed the plant producing Agent Orange in 1979 before decommissioning it in 1983.

More than 17,000 U.S. Vietnam veterans claimed disability payments relating to Agent Orange from the Veterans Administration. By 1984, 9,600 of the claimants had been hospitalized and 1,300 claims had been paid. In 1979, 9,000 veterans took the manufacturers to court, seeking \$44 billion in compensation. At the time, the case was the largest product liability case ever and the first mass tort class action. In an out-of-court settlement, the seven major producers of Agent Orange agreed to establish a \$180 million compensation fund for veterans. The veterans' lawyers accepted the settlement

after the judge warned the lawyers that their evidence was weak and that the case might drag on for years. The federal government and the manufacturers have since been accused of manipulating scientific evidence to refute the existence of a link between exposure to dioxin-contaminated Agent Orange and subsequent health problems.

According to company historian Ned Brandt, disabled veterans received from \$256 to \$12,800 and the families of deceased veterans from \$340 to \$3,400 in compensation. Approximately 39,000 veterans received money from the fund while 28,000 claims were rejected. When the 10-year period for making claims ended in 1995, \$21 million remained in the fund. Veterans and their families continue to file lawsuits against Dow and other manufacturers of Agent Orange as the original settlement excludes veterans who began to suffer the effects of exposure to dioxin after 1994.

UNIVERSITY OF YORK, ENGLAND

## Drexel Burnham Lambert

THE JUNK BOND kingdom of financier Michael Milken, of Drexel Burnham Lambert, was raking in

enormous profits during the boom of the 1980s. The boom had begun when Drexel offered to buy the telephone company MCI for \$1 billion. Within a few years, however, a notorious insider-trading scandal sent Drexel into bankruptcy and Milken to prison. Milken and Drexel had used junk bonds, high-yield bonds issued on high-risk companies, to rescue small companies that were going under because they could not get loans from traditional sources. It was later revealed that Drexel's customers were purchasing both original and secondary securities from one another. Drexel's customers were also being encouraged to buy securities that Drexel felt were crucial to its own success. What appeared to be huge profits for Drexel often came from money being shifted around within the company.

Many of Drexel's clients had gone bankrupt, lacked a credit history, or had insufficient capital. In the past, the only resource for such companies had been to negotiate short-term loans from banks or through private placements with insurance companies that offered highly restrictive stipulations on the loans. Drexel offered to underwrite loans on these high-risk companies with few or no restrictions; and in return, the companies paid high yields to investors and enormous fees to Drexel. Drexel had also discovered that their highest profits came from acquisitions and mergers, particularly from leveraged buyouts in which public companies were taken private. Surprisingly, the junk bond business was relatively free of government regulation, even though the industry handled trillions of dollars.

## PREDATOR'S BALLS

Beginning in 1979, Drexel hosted an annual convention that came to be called the Predator's Ball since the purpose of the meetings was to bring high-risk companies with bonds to sell together with investors who were willing to take the necessary risks. By 1984, the convention had developed into a wild party, which was attended by individuals with a combined purchasing power of \$3 trillion. In 1985, Drexel hosted its sixth annual Predator's Ball, which lasted for four days. No expense was spared on food and drinks, and the entertainment was provided by the legendary singer Diana Ross.

The 2,000 or so well-heeled investors included an A-List of corporate raiders and other corporate mavericks who bought junk bonds for insurance

companies, pension funds, savings and loans, and other institutions. In 1990, Drexel canceled the Predator's Balls, creating huge financial losses for the industries that had provided service for the ball and its attendees.

Drexel was plunged into hot water in May 1986 when both the Securities and Exchange Commission (SEC) and federal prosecutors filed charges against Drexel employee Dennis Levine for allegedly earning \$12.6 million in illegal profits from insider trading. The official charge against Levine was that he had been involved in a scheme "to buy and sell securities based on non-public information gained through his employment as an investment banker for five years." Levine was later sentenced to three years in prison and served 17 months. He was also required to pay \$11.6 million in fines and penalties.

Drexel announced that it would cooperate fully in all investigations. Levine's arrest was the first in a series that would ultimately bring down Drexel, the largest seller of junk bonds in the country. The investigation into the dealings of Drexel signaled an end to what had become known as "the greatest money-making boom in Wall Street's history." By the time ensuing investigations were over, a number of financial wizards were sent to prison, billions of dollars in fines would be levied, thousands of investors lost their funds, and careers and families were destroyed. As the Drexel Burnham Lambert scandal unfolded, hundreds of investors filed civil suits against the company and against Milken.

One of Milken's colleagues, Ivan F. Boesky was able to move billions of dollars in stocks with a few telephone calls from his office at Drexel. In November 1986, Boesky agreed to pay \$100 million in fines to settle charges of insider trading and promised to help the government go after other members of Drexel Burnham Lambert in an undercover operation. Boesky was especially helpful in bringing attention to Milken. For example, he pointed investigators toward a phony invoice that had resulted in a \$5.3 million payment to Milken and Boesky for "consulting services."

Once investigators felt confident of their cases, Milken and Drexel Burnham Lambert were subpoenaed. Boesky was sentenced to three years in prison for his part in the insider-trading scandal. In 1987, the case took an even more bizarre twist when John Mulheren, a manic-depressive and Boesky's best friend on Wall Street, was arrested for trying to kill

Boesky. Mulheren was convicted in July 1999, but the conviction was later overturned, allowing Mulheren to return to Wall Street.

In September 1988, the SEC formally charged Drexel Burnham Lambert and several individuals within the company with insider trading, stock manipulation, fraud, and various other violations of federal security laws. Lisa Ann Jones, a secretary at Drexel, was sent to jail for perjury for trying to protect her employers. In November 1990, Drexel pled guilty to six separate felonies and was fined \$650 million. In April 1990, Milken also pled guilty to six felonies and agreed to pay a \$600 million fine. In November of the following year, Milken was sentenced to 10 years in prison but was released after two years.

Drexel was severely criticized for paying out over \$250 million in employee bonuses in the two months before the collapse of the company. Leon Black, the head of mergers and acquisitions at Drexel, received the highest bonus at \$16.6 million, while 50 other Drexel employees received from \$1 to \$3 million dollars in bonuses. The bonuses, which were not illegal, amounted to more than double the amount on which Drexel defaulted. In 1990, Drexel declared bankruptcy. After Drexel emerged from Chapter 11 bankruptcy proceedings, its remaining assets were taken over by New Street Capital Corporation, a new company indirectly owed by Drexel's creditors.

The restructuring of Drexel's assets was handled chiefly by a 17-person team that was transferred as a whole from Drexel to Smith Barney and was headed by former Drexel employees James Schneider and David Ying. The federal government was severely criticized for its part in the cleanup when the Federal Deposit Insurance Corporation (FDIC) and the Resolution Trust Corporation ignored 1,465 lawyers retained by the government and hired the New York firm of Cravath, Swaine, and Moore to go after Drexel Burnham Lambert, in an effort to recover as many assets as possible in the suit against the troubled company.

While some of Drexel's star employees escaped prison, many of them were forced to change career directions. Fred Joseph, Drexel's chief executive officer (CEO), was banned from serving as a Wall Street CEO for life and was prohibited from taking a supervisory role in any New York Stock Exchange company for three years. During that period, Joseph served as a consultant in the dismantling of Drexel.

In 2003, Joseph made a comeback by forming Morgan, Joseph, and Company with the great-grandson of financial legend J. P. Morgan. Despite being banned from the securities industry for life, Levine set up an investment advisory business after being released from prison. Milken became one of three owners of the highly profitable Knowledge Universe, raised money for cancer research, and lectured on college campuses.

## drug trafficking

DRUG TRAFFICKING is an immensely profitable enterprise that involves white-collar crime, particularly money laundering and political corruption. It is defined as the movement of illegal drugs across borders. Major drug syndicates that now look very much like other multinational firms in terms of size, resources, and sophistication conduct this transportation system. While these drug criminals have become more sophisticated, law enforcers have been slow to adapt to changing patterns of white-collar crime.

The issue of illegal traffic in drugs is an old one. In the past, drug cartels relied upon brutality. Drug traffickers, such as the infamous Colombian Juan Pablo Escobar, were noted for torturing and murdering anyone who got in their way. Such tactics deeply antagonized other individuals, often to the

point of creating a multi-person vendetta, and placed pressure upon governments to crack down on the drug traffickers. Brutality, in short, was bad for business. Today's drug traffickers, such as the Cali cartel, only use violence if other solutions are not available. These entrepreneurs prefer to work quietly. Instead of intimidating others with violent crime, they practice the more profitable white-collar crime to ensure that business runs smoothly.

The success of a drug cartel rests upon its ability to launder money. Virtually all payments for drugs are made in cash and this cash must be laundered. Money-laundering, the process of concealing ill-gotten gains to make the money appear legitimate, and thereby evade detection and prosecution, has therefore become one of the major concerns of drug traffickers.

Governments have had increasing difficulty controlling aspects of the drug trade in part because of political disputes and historic patterns of crime. For example, while both the American and Mexican governments constantly state that they want to eliminate drug trafficking and sales, they are often in disaccord about how to stop these practices. Many Mexicans identify the root cause of the drug problem as unbridled consumption by American consumers while many Americans place emphasis on improved crime fighting tactics and abilities. The connection between Mexican officials (civilian politicians, local military commanders, and police officers) and illicit drug trafficking dates back to the 1920s, and it is therefore difficult to root out. Patterns of corrupt behavior have become firmly established within regulatory agencies.

The inability or refusal of governments to cooperate against drug traffickers has occasionally led to diplomatic crises. In 1998, the U.S. government obtained indictments against the employees of a dozen leading Mexican banks accused of laundering more than \$100 million in illegal drug money. The bankers were ensnared through Operation Casablanca, a three-year undercover sting operation run by the U.S. Customs Service. The operation lured drug traffickers and their bankers to a party in a small Nevada town that was to culminate in a visit to a local brothel.

It ended, instead, in a mass arrest as U.S. law enforcement agents moved in and spoiled the party. Some 160 arrests were subsequently made during which Mexican law enforcement and banking authorities were kept in the dark about the operation

for "security reasons" to protect against possible leaks. Mexicans were outraged by the violation of their national sovereignty and the Mexican government threatened to prosecute U.S. Customs agents and their informants since sting operations like Casablanca were illegal under Mexican law. Mexico eventually declined to prosecute.

The Casablanca episode resulted in part because of Mexican laws that prevented an investigation of money-laundering in the case of individuals who have not had a prior conviction for illegal enrichment or related offenses. Since most drug lords have successfully evaded such convictions, they are exempt from investigation. Additionally, in Mexico, money-laundering is a tax violation and not a criminal offense. Consequently, the country does not have same requirements for reporting money transactions that the U.S. has put into effect. This discrepancy has allowed drug cartels to use Mexico's official banking system and mostly unregulated dollar-exchange houses to launder cash. By mid-1999, Mexico had become a major center for the laundering of drug money with ostensibly legitimate businesses on both sides of the border.

## INTERNATIONAL CRIME

The new multinational drug traffickers are not always new businesses. The massive worldwide appetite for drugs has given rise to an international criminal network of unprecedented scope and sophistication. Long-established criminal organizations have formed alliances to profit from drug trafficking. The Hong Kong-based Triads have joined with the Japanese Yakuza to market synthetic drugs on a global scale. According to Colombia's National Police, the country's powerful drug cartels are cooperating with the Russian mafia and Eastern European crime groups. Marketing worldwide brings an obligation to launder money and corrupt officials on a global scale as well.

Crumbling state control in the countries of the former Soviet Union was an open invitation to organized crime. Drug traffickers were quick to reap profits from struggling democracies, and other countries with shaky or non-existent laws, ill-equipped police forces and uncertain market forces. Additionally, the sudden shift from communism to capitalism has fostered the organization of numerous front companies that allowed drug traffickers to hide money within legitimate enterprises. The Russ-

ian Interior Ministry estimated in the late 1990s that about 40,000 Russian businesses are controlled by organized crime. Among these are law firms, banks and other businesses that can launder money for drug traffickers.

A similar situation exists within China where the profit motive and market economy have become increasingly important. With these changes, crime and corruption have become more common. China is emerging as an important drug producing, consuming, and distribution center.

The efforts of governments to ease trade across national borders has had the effect of easing drug trafficking across borders. The European Union (EU) and the North American Free Trade Agreement (NAFTA) have weakened customs controls and other security safeguards thereby making it easy for international organized crime to move into new markets, distribute drugs, and shift money. It is no longer a significant challenge for drug traffickers to smuggle pounds of dollar bills out of the United States to a place where the money can be laundered through the international financial system.

While governments have cooperated to open up borders, they have not established uniform laws or procedures to deal with drug trafficking. Each country in the 25-member EU has its own laws for extortion, wiretaps, sharing of intelligence information, and the invasion of privacy. Interpol, an international organization based in Lyons, France, that fosters global police cooperation by sharing intelligence about cross-border criminal activities among its 181 member nations, lacks both a police force and the ability to prosecute criminals. Each member country maintains and staffs a National Central Bureau to direct Interpol intelligence while local authorities investigate and prosecute criminals according to national laws. This lack of uniformity has permitted traffickers to exploit national weaknesses. They have, most notably, taken advantage of bank secrecy laws in such financial havens as Liechtenstein and Switzerland to hide massive amounts of money.

The history of the Caribbean has helped drug traffickers. The disparate legal systems of the region are based on the legal systems of the countries that conquered the islands. These disparate legal systems

based upon Dutch, English, French, and Spanish law have made for weak implementation of laws against drug trafficking. The international community has major treaties in force against drug trafficking and money laundering, including the 1988 United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances. In 1998, the United Nations General Assembly had a special session on drugs, where it adopted new strategies to reduce both the supply of and the demand for illicit drugs. Despite these attempts to impose some global order, transnational drug traffickers continue to flourish. They establish networks of informers within governmental agencies, such as they have done with the various police forces in Mexico. They foil law enforcers by hiding out in "safe" countries or changing trafficking routes from one nation to another when the trail gets hot.

Most nations have agreed that action must occur at the international level if drug trafficking is to be defeated, but little effective action has been taken. As a result, the drug trade has become the fastest growing industry, legal or illegal, in the world. Drug trafficking has become the largest and most profitable tangent of white-collar crime with the tentacles of the criminals reaching into every segment of society.

## E. F. Hutton

ANYONE OLD enough to remember the heyday of E. F. Hutton remembers their ad, “When E. F. Hutton speaks, people listen” in which entire city blocks fell silent to hear the pearls of financial advice spoken by in whisper by a Hutton client. Chief Executive Officer Robert M. Foman was so enamored of Hutton’s image that he built a 29-story, \$100 million headquarters in Manhattan, New York City, that some people called a memorial to corporate greed.

People stopped listening to Hutton, however, after discovering that the company had been engaged in a systematic effort to avoid paying interest on short-term bank loans through a complicated scheme of check kiting. The scheme came to light in December 1981 when Hutton gave in to the pleas of the Batavia, New York, branch of the Genesee County Bank and moved accounts for its local office from the Marine Midland Bank to the small, local bank.

Over the next several days, bank officials began noticing that Hutton deposited checks worth millions of dollars. Without waiting for credit from the Federal Reserve, the bank had also paid \$8,000,000 on checks that had been written by Hutton on the account. Amazingly, the amounts that Hutton were depositing and withdrawing added up to more than

the bank’s total assets. Internal auditors who were told to monitor the Hutton account wondered why the amounts were so large when Hutton’s local office employed only four people.

Within nine days of opening the Genesee account, Hutton had deposited \$26,427,507 in checks. The 11 checks had all been written by Hutton on its accounts at United Penn Bank in Wilkes-Barre, Pennsylvania, and American Bank and Trust Company in Reading, Pennsylvania. Hutton was inexplicably moving funds among the three banks. Within that same nine-day period, Hutton had written numerous checks on the Genesee Bank totaling \$26,432,000, resulting in an overdraft of \$4,493. After additional checks arrived at the Genesee Bank, officials checked with United Penn Bank and learned that Hutton had funds to cover one but not both of two checks written on December 8 for \$6,000,000 and \$8,000,000.

Later that day, Hutton also deposited a check written on the Reading bank for \$110,000, followed by a check for \$500,000 two days later. The Reading account did not have sufficient funds to cover either check. The Genesee Bank decided to freeze the Hutton account and returned checks for \$2,071,000 and \$8,000,000, notifying the local Hutton office of their action.

During a visit to the local Hutton office, three Genesee officials told Hutton to take their business

elsewhere. The bank subsequently returned three checks totaling \$7,000,000.

Following company procedures, Genesee officials notified the auditor of their parent company about the problems with the Hutton account. Officials there reported Hutton's activities to the deputy supervisor of New York banks and sent copies to the Federal Reserve and the Federal Deposit Insurance Corporation. New York State investigators discovered that Hutton's paper trail led to Manufacturers Hanover Trust (Manny Hanny) and Chemical Bank at which Hutton's main accounts were lodged. By auditing four days of Hutton activities at the two banks, state regulators found the same pattern of inexplicable transfers of funds between Hutton offices and the two banks. For instance, audits of the Manny Hanny accounts uncovered an overnight overdraft of \$1.3 billion on the Hutton account. Both banks were astounded to learn that Hutton had been using overdrafts as short-term, no-interest loans that cheated the banks out of millions of dollars in interest. To do this, Hutton had used a check-kiting scheme, which was variously known as "chaining" or "floating" to amass huge profits at the expense of banks that handled their accounts.

Federal investigators pursued Hutton tirelessly, deciding to use Hutton to bring an end to the practice of overdrafting by big corporations. Finally, prosecutors concluded that the evidence gathered from Hutton's activities at the Northern Central Bank in Williamsport, Pennsylvania, where Hutton had been overdrawing its account for \$900,000 a day during most of 1981, provided evidence that was clear enough for a jury to understand Hutton's "illegal, fraudulent, and criminal" actions. Surprisingly, no individuals within E. F. Hutton had been targeted by investigators.

Letters dated April 20, 1984, were sent to E. F. Hutton Group, E. F. Hutton and Company, and various Hutton officials informing them of the Department of Justice's intent to prosecute E. F. Hutton. Lawyers predictably advised Hutton officials to claim the Fifth Amendment. In February, federal prosecutors found their "smoking gun" in a memo dated April 1982 written by one Hutton official to another describing the check-kiting scheme in detail.

In 1985, E. F. Hutton pleaded guilty to 2,000 counts of mail and wire fraud and was required to pay a \$200,000,000 fine in addition to repaying

banks for all money lost, plus interest. Convinced that his company had done nothing wrong, Foman paid former Attorney General Griffin Bell \$3,000,000 in fees and expenses to investigate the activities of his employees. The move backfired, and the House of Representatives opened hearings on the Hutton fiasco.

On November 8, 1986, Robert P. Rittereiser succeeded in forcing Foman to step down and took over as Hutton's chief executive officer. After taking charge of E. F. Hutton, Rittereiser set a massive reorganization plan in place. He divided Hutton into two parts: one to handle retail brokerage services and the other to oversee institutional and capital markets. Unfortunately for Hutton, on October 19, 1987, the stock market plummeted 508 points in a single day. As a hypothetical exercise, Cable News Network (CNN) explored the influence of an insolvent brokerage house on investors.

E. F. Hutton was described as a "weak link in the financial chain," and Hutton executives recognized that reclassification from its A-2 commercial rating to A-3, the lowest possible rating, was imminent. Stock shares in the company dropped \$11, and it was rumored that E. F. Hutton was in danger of going under and that Foman had committed suicide. Standard and Poor's let it be known that Hutton's credit rating was under close scrutiny. In an effort to recoup, the company had spent employee retirement funds with no ability to replace the funds' capital.

The best course of action seemed to be to sell E. F. Hutton. Foman liked the idea of revenge on Rittereiser and was also attracted to the prospect of a \$3,000,000 investment-banking fee for his role in the sale. After 83 years of providing successful advice, Hutton was up for grabs. The front leaders in the bidding war were Merrill Lynch, Dean Witter, and Shearson Lehman. After Shearson's bid of \$960 million, \$29.25 per share, was accepted on January 29, 1988, 1,450 Hutton employees were dismissed, and armed security guards searched them as they left the building. Over the next month, an additional 3,350 Hutton workers received pink slips. Ironically, Hutton had rejected a Shearson offer of \$50 a share in 1987. After the buyout, no one was listening to E. F. Hutton; it no longer existed.

## Eastern Europe

THE RISE OF white-collar and organized crime in the Eastern European (EE) nations closely parallels that of their powerful neighbor, Russia. Eastern Europe generally refers to the states formerly under the control of, or heavily influenced by the Soviet Union: Albania, Bulgaria, Czech Republic (Czechoslovakia), Hungary, Poland, Romania, and former Yugoslavia.

Once the state socialist economies collapsed in the late 1980s and early 1990s, massive economic crisis and sociopolitical dislocation created a power vacuum which has been largely filled by organized criminal elements. The economic crisis spawned by civil war and international military intervention in the Balkans also opened up opportunities for local mafias. As in Russia, neo-liberal policies, socioeconomic disparity and weak legal and democratic structures have fostered the integration of "legitimate" and "illegitimate" business. While the extent of the economic crisis in most of the EE nations has not been as severe as in Russia, all countries have registered a growing influence by organized crime in diverse economic sectors, and much of this crime is transnational with groups from various countries, especially Russia, intimately involved in numerous countries of the European continent.

The bureaucratic command economies of the EE regimes were highly centralized: production and distribution of goods were organized by state-controlled companies. As in Russia, increasing integration with the world market and growing problems in effectively coordinating the highly bureaucratic economy led, by the 1970s, to the development of a thriving black market, especially for consumer

goods and foreign currency. In all the EE nations, there was misappropriation and outright theft of state property and speculation in scarce goods. Criminal networks, including officials from state institutions, gradually consolidated through the late 1970s and 1980s. Beginning as small-scale suppliers of clothing, household articles, and building materials, some groups branched out into the bootlegging of alcohol and drug trafficking.

After the fall of the Berlin Wall in 1989 and the rapid disintegration of the bureaucratic command economies, the openings for organized crime multiplied. Socioeconomic marginalization increased dramatically, providing a fresh recruiting ground for criminal organization as well as a sharp reduction in the population's trust in legal private enterprise and government structures. Liberalization and privatization programs were corruptly managed, giving white-collar criminals in organized crime new economic activities to exploit.

As Michel Chossudovsky writes, the privatization programs in all the EE nations "favored the transfer of a significant portion of state property to organized crime." As traditional state economic structures were weakened, so too was law enforcement. Gradually, according to Ben Fowkes, organized crime brought "a culture of bribery, theft and even violence from the underground economy into the world of legal private enterprise."

The emphasis by governments on property rights and market freedom occurred at the expense of public accountability, sociopolitical equality, and economic security. While there has been economic recovery in some countries, the lion's share of the wealth has been concentrated in the hands of a tiny minority of politicians and business people, most of whom have connections with organized crime.

### BULGARIA

In Bulgaria, the privatization process offered windfall opportunities for ex-politicians such as Andrei Lukanov, twice former premier of the government and leading member of the post-communist party. Lukanov and his associates took up key positions in the newly privatized banks and industries and eventually formed a powerful financial-industrial conglomerate, Multigroup.

The directors of many of the companies in this group allegedly had access to communist party funds through banks accounts in Switzerland and

*Members of the House of Parliament in Budapest, Hungary, have been unable to stem the rise of white-collar crime, as privatization of the Hungarian state companies has delivered quick and handsome profits.*

Austria. It was suspected of pilfering state assets through hidden privatization schemes and other illegal practices. For instance, Multigroup's Intersteel used Lukanov's connections with newly privatized Russian gas companies to make huge profits from managing the old state steel company, which is one of the largest consumers of Russian gas in the country. Lukanov was assassinated in 1996 allegedly by rival organized crime interests. The illegal growth of Multigroup was replicated by diverse groups in all economic sectors so that by 2000, over half of Bulgaria's private companies were controlled by mafia interests.

## HUNGARY

In Hungary, liberalizing measures were first introduced in the 1970s: there was a steady increase in travel between EE countries and the gradual development of small-scale private industry and cross-border retail. In this way, the country became a transit corridor for Yugoslavian and Albanian arms smugglers and the location of stolen goods networks operated by Polish syndicates. Local criminal elements made common cause with these foreign groups, which soon included gangs from the Soviet republics, facilitating the growth and extension of criminal networks in and through Hungary.

Continued expansion of the private sector led to growing concentrations of private capital which became targets for organized crime. According to the former chief of the Investigation Department of the National Police in Hungary, these gangs would plant spies in high society to target potential victims and use separate gangs to execute burglaries. Still another group would be responsible for fencing or selling the stolen goods. Simultaneously, the semi-privatization process of certain areas of the economy such as catering, tourist, and entertainment allowed these gangs to launder their money and invest in "legitimate" businesses.

After the communist state collapsed, Hungarian mafias expanded their operations. By 1994, 30 percent of the gross domestic product was produced through the expansion of the black market economy of the pre-Soviet days. With rising unemployment, skyrocketing inflation and a drastic decline in economic output, crime gangs moved into all areas of the economy to provide goods and services unavailable in the legitimate economy. Privatization of the state companies also promised quick and handsome profits. The state oil monopoly was abolished in the 1990s before legal regulations were enacted to govern the new private market. Organized crime quickly took advantage of this legal vacuum, creating oil companies and using old state facilities at no

cost to dominate the market. A two-tier pricing system designed to shield ordinary citizens from price gouging also resulted in new black market opportunities for the local mafia.

The extraordinarily lucrative profits to be gained from the oil business alone has led to fierce competition and mounting violence, including numerous gangland-style executions. Since 1991, there have been more than 100 bombings and grenade explosions in Hungary as rival elements fight it out for influence and wealth.

### BALKAN PENINSULA

The countries of the Balkan peninsula have also seen a dramatic increase in organized and white-collar crime. The civil wars of the 1990s and continued political instability in the former Yugoslavia have fostered the development of conventional organized criminal activities such as consumer goods smuggling, drug trafficking, prostitution and auto theft. Albanian gangs have used their connections with growers in Afghanistan and an increasingly sophisticated use of the internet to corner the heroin market in much of Europe. When sanctions were

imposed on Serbia in 1992, land and water routes were strictly controlled within Yugoslavia, allowing the emergence of widespread black market networks of fuel, food, and other goods which circumvented the embargo through cross-border trade from Bulgaria and Romania. It is also apparent that much of the billions in aid to countries such as Bosnia—either in the form of money, food, or medicine—has been stolen by local mafias in alliance with corrupt politicians.

### POLAND

In Poland, the story is similar. The more than 400 organized criminal factions are involved in everything from drug trafficking and prostitution to protection rackets and smuggling. The U.S. State Department claimed in 2001 that Poland had become a major center for the production of synthetic drugs such as Ecstasy and amphetamines, as well as a trans-shipment point for suppliers of narcotics in Turkey and the Ukraine. Drug addiction and drug-related crime have soared in the last decade. The drug business is apparently controlled by three major syndicates operating out of Gdansk

*Gray smoke rises above the rooftops of Warsaw, Poland, symbolizing the rise of industrial capitalism and its side effects of pollution, and growing organized and white-collar crime.*

and Warsaw. The Pruszkow mafia is one of the largest of such groups. It engages in car and art theft, money laundering, extortion, prostitution and drug trafficking. It has been involved in a bloody turf battle with the Wolomin group for control of these lucrative economic activities.

As in Russia and other Eastern European countries, the importing and exporting of women for sexual exploitation is flourishing in Poland. Police estimate that 15,000 young women from Bulgaria, Romania, and the former Soviet republics are brought into Poland for prostitution each year. Recent reports suggest that criminal groupings from other EE nations and the former Soviet republics have made attempts to take over this trade, resulting in public gun battles and numerous murders.

#### CZECH REPUBLIC (CZECHOSLOVAKIA)

In Czechoslovakia (split as the Czech Republic and Slovakia in 1993), organized criminal gangs were first founded by immigrants from the large Vietnamese community. By 2003, there were 10-15 such organizations involved in smuggling goods such as cigarettes and people from Central Asia and Southeast Asia to Western Europe, including sex trade workers. Vietnamese gangs engage in money laundering, drugs, and extortion and invest in legitimate business such as restaurants and casinos. In recent years, authorities report that native Czechs are now working for these criminal elements who inextricably merge traditional organized crime with legitimate business.

By the mid-1990s, the Czech Republic also received an influx of organized criminal gangs from Russia, the Ukraine, and Chechnya. Beginning with illegal immigration schemes for Russian and Ukrainian workers, these international groups expanded into drug trafficking and prostitution. Transnational gangs such as these have introduced the highly profitable trade of arms smuggling into Czechoslovakia in the early 2000s. Arms smugglers use the country to sell to rogue regimes seeking clandestine deals that will not be noticed by international authorities. In 2002, two Czechs and a Canadian were arrested for allegedly selling small arms to Iraq.

During home searches, catalogues of Russian-made weapons were found which were being offered to customers in Arab countries. In addition to firearms, the catalogues also offered tanks, missile

carriers, boats, and planes. In 1999, a Czech company was discovered trying to sell six fighter jets to North Korea. Weapons trading is officially legal in the country, but government spokespeople admit that they have little control over the companies or the thousands of transactions that occur each year.

#### ALBANIA

The Albanian economy enjoyed an economic boom in the early 2000s. Yet, observers such as the respected non-governmental organization, International Crisis Group (ICG), note that just under half of the gross national product results from organized crime. As in the other EE countries and Russia, the distinction between corporate crime and organized crime is blurry, especially since organized crime runs, or heavily influences corporate behavior, whether legal or not. As Kreshnik Spahiu, a lawyer involved in anti-drug trafficking cases, laments, "The reality is that Albania is built with black money." In the early 1990s, the first phase of the post-communist transitional economy was financed through pyramid schemes which collapsed in 1997, bringing with them widespread chaos. According to the ICG, a wide layer of politicians, government bureaucrats, police and respectable businesses are all implicated in organized crime.

#### ROMANIA

Romania does not grab as many of the headlines as the other European countries, yet its population of 22 million makes it one of the biggest countries in Eastern Europe. It shares all the major features of organized crime in the neighboring nations: close ties to politicians and respectable firms, shady dealings with formerly state-owned property, and involvement in smuggling, prostitution, and extortion schemes.

The early 1990s saw a massive banking fraud perpetrated by former state officials which led to the loss of the life savings of tens of thousands of small-scale investors. Romania's current economic woes stem from massive under-development during the communist era. Once again, mafia elements have moved in to take advantage of a poorly functioning system of consumer goods production and distribution. The country's proximity to Russia has also facilitated the growth of drug trafficking, illegal immigrant smuggling, automobile theft, and, per-

haps most seriously, a black market in nuclear material from the former Soviet republics. Romania's organized crime comprises tightly knit crime families with close connections to politicians, like-minded mafias in the other EE countries, and legal private enterprises.

While there have been attempts by lawmakers and the police, often in alliance with international agencies and governments, to combat organized crime in Eastern Europe, most observers report that it is a losing battle. Some nongovernmental organizations, trade unions, and other groups in civil society have begun to courageously publicize and organize against corruption, but these initiatives have so far only made a minor impact.

## economic espionage

ACCORDING TO THE Federal Bureau of Investigation (FBI), economic espionage refers to the stealing of trade secrets or confidential information by foreign governments or companies against U.S. businesses. Trade secrets are any secretive, private,

or proprietary intellectual property including formulas, patents, budget and marketing plans, customer lists, new technology developments, pricing information, or any other type of information that has some potential economic value. These secrets typically account for roughly 70 percent of a company's market value, making them a highly valuable asset and a prime target of many competitors.

The premium placed on such information represents a fundamental shift from an economy based on tangible goods to a system based on intellectual property. Illegally obtaining access to a trade secret gives foreign competitors several advantages. It gives foreign entities the opportunity to introduce the product or service before anyone else, and thus realize a larger profit. In addition, the stealing of trade secrets allows an entity to under-price the original owner or developers since less money is needed for research and development. Finally, economic espionage allows a company to modify and/or improve upon the stolen trade secrets.

Several companies consider economic espionage a more cost efficient means of spending resources. Rather than spend the time and money to conduct actual research and development, companies can spend a fraction of the cost to steal information.

In one of the largest economic espionage cases to date, Avery Dennison spent roughly \$200 million on research and development over a four-year span to develop adhesive formulas and tapes. One of its foreign competitors Four Pillars, a Taiwan-based company, paid an Avery Dennison employee, Victor Lee, only \$160,000 over eight years to steal proprietary information concerning the development of adhesive formulas. In all, Lee stole approximately 12,000 research and development documents including 71 adhesive formulas and 37 trade secrets concerning specialized adhesive tapes.

Estimates indicate that economic espionage costs U.S. companies tens of billions of dollars each year in lost trade secrets and other proprietary information. According to the American Society for Industrial Security (ASIS) and federal government estimates, U.S. businesses lost approximately \$1.2 trillion during the 1980s to economic espionage. More recently, a 1999 ASIS survey indicated that 97 of the top 1000 Fortune companies lost over \$45 billion in stolen trade secrets. Approximately half (44) of the companies had more than 1,000 incidents of theft totaling nearly \$1 billion. The aver-

age estimated loss was approximately \$500,000 per incident.

According to the survey, most acts of economic espionage occurred in high technology and service industries, while the manufacturing industry tended to lose the most money, averaging a loss of almost \$50 million dollars per incident. Small and medium-sized businesses generally suffered the most significant losses. Many of these companies were unable to recover from the loss of trade secrets which are extremely vital for survival.

## NATIONAL SECURITY

The tremendous scope and huge financial losses attributed to economic espionage led former FBI Director Louis Freeh to assert that foreign countries stealing and spying on U.S. companies represents the most serious threat to the nation's security since the Cold War era (aside from terrorism). In this respect, economic espionage has been viewed as a threat to the long-term survival of many U.S. companies.

Traditionally the term *espionage* was associated with military spying and the stealing of military information or secrets. With the end of the Cold War, a new form of espionage emerged that concentrated more on the spying and stealing of confidential economic and intellectual properties. At the same time, the United States emerged as a dominant economic power. Subsequently, America became one of the leading nations in developing valuable intellectual property and contributing new services and products to the world market. As a result, foreign companies and governments began to establish spy networks to target and obtain U.S. companies' trade secrets in order to remain competitive. During the 1990s, FBI information revealed that at least 23 countries had engaged in acts of economic espionage against U.S. companies.

Another FBI finding indicated that at least 100 foreign governments and/or businesses were spending resources to target and acquire U.S. technology. Over half of these companies were using covert operations. The most frequently targeted industries include aerospace, computer hardware and software, defense technology, and biotechnology. Because of the increased development and reliance on computers, most companies have become especially vulnerable to hacking. In 1994, a group of hackers from St. Petersburg, Russia, stole over \$10 million from

Citibank. The group hacked into the company's computers and transferred money into banks in seven different countries. Computers have allowed companies to store more information in a single location, but at the same time this information has become more accessible and easier to steal. Through the use of a computer, a single individual can copy, download, and transfer confidential information within minutes to other parts of the world. In addition, computers provide a great deal of anonymity making it difficult to apprehend offenders. Lastly, the use of computers to engage in economic espionage makes investigation and detection a fairly complex and difficult task. In many ways, computers have inadvertently become a tool in the realm of economic espionage.

## ECONOMIC ESPIONAGE ACT

In order to address the growing concerns of U.S. companies and their vulnerability to economic espionage, Congress enacted the Economic Espionage Act (EEA) of 1996 to effectively criminalize the stealing of trade secrets. Under the EEA, trade secrets are broadly defined to include "all forms and types of financial, business, scientific, technical, economic, or engineering information, including patterns, plans, compilations, program devices, formulas, designs, prototypes, methods, techniques, processes, procedures, programs, or codes, whether tangible or intangible, and whether or how stored, compiled, or memorialized physically, electronically, graphically, photographically, or in writing." The EEA also stipulates that the owners must take "reasonable measures" to keep confidential information a secret. If owners fail to safeguard proprietary information, no one can be rightfully accused of stealing it. Finally, the act requires that the trade secrets must have some form of actual or potential economic value.

The EEA is a combination of sections 1831 through 1839 of the U.S. Codes. The Foreign Trade Secret Theft or section 1831 of the EEA specifically addresses the issue of economic or foreign espionage. In many respects, problems and concerns with foreign invasions were the single most important reason why the EEA was passed. Under section 1831, criminal penalties will occur when an accused steals without authorization a trade secret that will knowingly or purposefully benefit any foreign government and agency.

This includes the stealing by any foreign government or agent or anyone acting on their behalf. Criminal penalties for violating this section of the EEA include a fine of up to \$500,000 or imprisonment up to 15 years, or both for an individual and for an organization, a fine of up to \$10 million. Also under the EEA, a court can force a person to forfeit to the United States any property or proceeds obtained directly or indirectly from a violation of the EEA.

## PROSECUTION

Prosecutions under the EEA have been relatively rare. As of 2003, only 37 cases have been successfully prosecuted under the act. One of the primary problems is the reluctance of companies to file criminal charges. Most companies fear the risk of publicly disclosing valuable trade secret information through court documents. In an espionage case involving Bristol-Meyers Squibb and their secret formulas for the cancer-fighting drug, Taxol, federal judges ruled that prosecutors had to release the confidential documents to the defendants' lawyers in order to protect due process rights. The defendants' were Yuen Foong Paper Co., a Taiwanese company that had two employees.

They approached an FBI agent, posing as a Bristol-Meyers technology information broker, and allegedly offered him \$200,000 plus a percentage of their sales for access to Taxol technology. Bristol-Meyers appealed the ruling in an effort to protect the secrets from those accused of attempting to steal them. In this way, the EEA presents problems for both victims and the accused. Many companies have turned to private consulting or intelligence agencies to help prevent future incidents of economic espionage.

## Edelhertz, Herbert (1922–1999)

HERBERT EDELHERTZ WAS a criminologist and scientist who specialized in the study of white-collar crime and organized-crime business activities. He authored several books and reports on the business of organized crime, corporate fraud, and the prosecution of white-collar crime. Edelhertz defined white-collar crime as any "illegal act or series of illegal acts committed by non-physical means and by concealment or guile, to obtain money or property, to avoid the payment or loss of money or property, or to obtain business or personal advantages." This explanation, though it attempts to improve upon Edwin H. Sutherland's original working definition of white-collar crime, has been criticized for its overbroad approach that leaves room for the inclusion of non-occupational crimes.

Edelhertz, however, claimed that Sutherland's definition ("a crime committed by a person of respectability and high social status in the course of his occupation") was too restrictive. He believed that white-collar crimes encompassed non-business activities such as filing false personal income tax returns, claiming fraudulent social security benefits, and concealing assets in a personal bankruptcy.

In his essay for the book *White Collar Crime: An Agenda for Research*, Edelhertz stressed the importance of distinguishing between "the different forms of behavior that fall under the rubric of white-collar crime, since they may vary so widely in terms of motivation, characteristics or *modus operandi*, victims, impact, and amenability to remedies." He also recommended better data availability on the incidence and impact of white-collar crime. Edelhertz described how solving the problem of white-collar crime must include a focus on the issues of equity and sentencing. The disparity between the infrequency with which criminal charges

are brought against white-collar offenders and the regularity with which “crimes of the poor and disadvantaged” are prosecuted is a shortcoming of corporate crime policy. When Edelhertz published his report, *The Nature, Impact and Prosecution of White-Collar Crime*, the National Institute of Law Enforcement and Criminal Justice felt that white-collar crimes were receiving scant attention from the law enforcement agencies and research communities. As the economic and social environment of a region changes, Edelhertz wrote, we become more vulnerable to white-collar crime. Although street crimes, burglaries, and drug violations seem more pressing, Edelhertz asserted that “to ignore white-collar crime is to undercut the integrity of our society.”

Edelhertz was in the private practice of law before becoming a staff scientist in the Science and Government Center of the Battelle Human Affairs Research Centers in Seattle, Washington. He also directed nationwide federal prosecutions of white-collar criminal activities as chief of the Fraud Section, Criminal Division, U.S. Department of Justice.

UNIVERSITY OF SOUTHERN MAINE

## Eisenhower, Dwight D. (1890–1969)

IN THE 1952 presidential election, both the Democratic and Republican parties courted General

Dwight Eisenhower who had led the Allied forces to victory in World War II, and who had served as commander of NATO forces from 1948 to 1951. Eisenhower was not a partisan by any means. Before 1952, he had never voted in a single election. One of Eisenhower’s most lasting legacies was the appointment of Earl Warren (1891–1974) as chief justice of the Supreme Court in 1953.

The Warren Court became one of the most liberal courts in the history of the United States, handing down major decisions that changed the fabric of life in America. For instance, *Brown v. Board of Education* 347 U.S. 483 (1954) began the move toward desegregation of public schools; *Gideon v. Wainwright* 372 U.S. 335 (1963) required states to provide lawyers for individuals who could not afford them; and *Griswold v. Connecticut* 381 U.S. 479 (1965) articulated the implied right of privacy that led to the landmark abortion decision *Roe v. Wade* 412 U.S. 962 (1973). Eisenhower later said that naming Warren to the Court was the worst decision he made as president.

#### MILITARY-INDUSTRIAL COMPLEX

Perhaps Eisenhower’s greatest legacy in the field of white-collar crime was his unprecedented acknowledgement and warning to the American public about the collusion of industry and government.

In his farewell speech in 1961 prior to departing from office, Eisenhower outlined his concerns:

... This conjunction of an immense military establishment and a large arms industry is new in the American experience. The total influence, economic, political, even spiritual, is felt in every city, every State house, every office of the Federal government. We recognize the imperative need for this development. Yet we must not fail to comprehend its grave implications. Our toil, resources and livelihood are all involved; so is the very structure of our society.

In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military industrial complex. The potential for the disastrous rise of misplaced power exists and will persist.

We must never let the weight of this combination endanger our liberties or democratic processes. We should take nothing for granted.

Only an alert and knowledgeable citizenry can compel the proper meshing of the huge industrial and military machinery of defense with our peaceful methods and goals, so that security and liberty may prosper together. The prospect of domination of the nation's scholars by Federal employment, project allocations, and the power of money is ever present and is gravely to be regarded.

Eisenhower's warning could not have been more prescient. In subsequent decades, the revolving door of professionals working for government agencies and then being hired by the very same contractors whom they previously supervised, and vice versa, has grown exponentially. Government contract fraud, government procurement fraud, bribery, and collusion have become major white-collar crimes and can threaten the integrity of presidential administrations as well as companies.

In 2003, Eisenhower's concept of the collusion between government and business was illustrated once more as Vice President Dick Cheney's former company, Halliburton, scooped up numerous reconstruction contracts in post-war Iraq. Public scrutiny questioned just how much an influence Halliburton had in President George W. Bush's decision to invade Iraq.

## Eli Lilly

SINCE THE 1970s, this pharmaceutical manufacturer has been hit with hundreds of lawsuits arguing that the company failed to disclose risks associated with four substances: diethylstilbestrol

(DES), a synthetic estrogen widely used to prevent miscarriages; Oraflex, an anti-inflammatory; Prozac, the popular antidepressant; and thimerosal, a preservative used in vaccines. Of the drugs that Lilly may have marketed without proper research or disclosure, DES has caused the most pervasive and best documented harms. The Centers for Disease Control and Prevention (CDC) estimate that 5 to 10 million people are at risk from side effects from DES, many of them children or grandchildren of women who were prescribed the drug.

First synthesized in 1938 by Edward Charles Dodds, DES was embraced by researchers as a less expensive, more potent substitute for natural estrogen, potentially able to cure a variety of female reproductive ailments. Colleagues recall Dodds consulting for Lilly in the 1930s, says investigative journalist Robert Meyers, but Lilly attorneys deny the researcher was ever on the payroll. Since Dodds refused to seek a patent, Lilly was only one of over 250 companies that would make or market the drug.

Dr. Don Carlos Hines recalled later, in testimony prepared for Lilly's defense, that in December 1940 he joined with representatives from three other major pharmaceutical companies to pool their research in support of Food and Drug Administration (FDA) approval for DES. Hines also insisted that results from animal testing, which showed that DES caused cancer and reproductive abnormalities, could not be generalized to humans.

In 1979, a New York jury disagreed, awarding Joyce Bichler, whose mother had been prescribed DES while pregnant, \$500,000 in civil damages. The jury found that Lilly had coordinated with other drug manufacturers to avoid doing proper testing, and that a prudent manufacturer would never have brought the product to market if testing had been done.

Bichler was one of a number of women, all exposed in the womb to DES, who in their teens or early 20s developed a rare form of vaginal cancer, clear-cell adenocarcinoma. A pattern of this disease, formerly seen only in post-menopausal women, was noticed in the late 1960s by Dr. Howard Ulfelder of Massachusetts General Hospital. Researchers later found that "DES daughters" also face higher risks for reproductive tract abnormalities, ectopic pregnancies, and infertility. Problems found in "DES sons" include genital abnormalities and a higher rate of noncancerous

cysts on the testicles. Women who took DES may face higher breast cancer risks.

Meyers notes that Lilly's salespeople were actively promoting DES to doctors and pharmacists even before it was approved by the FDA. Among the research omitted from later DES promotional brochures was a study, conducted from 1950 to 1952 at the Chicago Lying-In Hospital, that found DES not only failed to prevent miscarriages but seemed to cause them. Lilly did not fund its own research on DES effects until after the FDA banned the drug in 1971.

The company did fund research on anti-arthritis drug Oraflex, approved by the FDA in 1982. However, they did not disclose to the FDA that the drug could cause liver or kidney damage in elderly patients, despite reported fatalities in the United Kingdom and Denmark. Available for just three months in the United States, Oraflex is believed to have caused 26 deaths and 200 cases of non-fatal organ failure. In August 1985, Lilly pled guilty to 25 misdemeanor counts of withholding information and mislabeling, paying \$1,000 per count. The sole civil judgment against Lilly was secretly settled during the appeals process.

Secret settlements were also critical to Lilly's ability to fend off lawsuits related to the popular anti-depressant Prozac, explains an investigative report by the company's hometown newspaper, the *Indianapolis Star*. As well as quietly settling more than 200 suits alleging that Prozac caused violent or suicidal behavior, Lilly offered to pay the legal costs of doctors sued for prescribing the drug. "This is a public relations controversy, not a medical controversy," Lilly spokesman Edward West told the *Wall Street Journal*. The active ingredient, fluoxetine hydrochloride, is no longer under patent. Lilly continues to market Prozac despite a 73 percent drop in U.S. sales of fluoxetine products in 2002; the drop is attributed to generic competitors.

Strangest of Lilly's product liability dramas is how protection from lawsuits related to thimerosal, a mercury-based vaccine preservative not used in the United States after 1999, found its way into the Homeland Security Act of 2002. Title 17 amends the Public Health Service Act to set a three-year time statute of limitations on civil suits for harms from any labeled component of a vaccine, not just the active ingredients.

Most cases would instead go to a special vaccines court administered by the U.S. Court of Fed-

eral Claims. Though faced with lawsuits from parents who claim that thimerosal in routine vaccinations caused their children's autism, Lilly denied lobbying for the measure. Retiring Senator Dick Armey (R-TX) claimed credit, but many pundits dismissed this as a publicity move. Considerable debate surrounds medical studies on potential links between vaccines and autism.

With the exception of vaccines, all of the company's product liability issues have centered on flagship products. Lilly claimed from 50 percent to 70 percent of the market for DES and held patents on Oraflex and Prozac. The latest marketing success to face legal challenges is Zyprexa, a schizophrenia drug that accounted for one-third of Lilly's sales in 2002. Five suits accuse Lilly of suppressing evidence that Zyprexa can trigger diabetes.

On the other hand, Lilly's corporate record is not all suspect; the company has developed numerous initiatives, including, for example, producing new and safer forms of insulin and spending millions per year on diabetes education.

## elite crime

ELITE CRIME includes acts committed by members of the upper classes, including these who head corporate and governmental organizations. The phrase perhaps best fits Edwin H. Sutherland's definition of white-collar crime as "a crime committed by a person of respectability and high social status in the course of his occupation."

Though the cases have been made that white-collar crime encompasses more than just occupational malfeasance committed by persons of "high social status," (note, for example, crimes committed by low-level employees), crimes committed by elite members of society may have the most damaging effect. Elite crimes may be committed for personal gain and/or for fostering the power, profitability, or influence of the organization.

White-collar crime is massively harmful financially, but also includes violence and reduction of civil liberties. 2002's big crime story was a long and complicated saga of corporate financial shenanigans that caused a significant drop in stock market prices. Although the economic losses were widespread, *Fortune* magazine notes: "The not-so-secret dirty secret of the crash is that even as investors were losing 70 percent, 90 percent, even in some cases all of their holdings, top officials of many of the companies that have crashed the hardest were getting immensely, extraordinarily, obscenely wealthy."

At center stage was Enron Corporation, a multibillion-dollar energy-rights trading company, which declared one of the largest bankruptcies in history on December 2, 2001, with debts of over \$31 billion. Enron was subsequently accused of having perpetrated a massive "disinformation" campaign, hiding the degree of its indebtedness from investors by treating loans as revenue, and hiding company losses by creating new firms with company capital, and then attributing losses to them rather than Enron. As Enron shares were taking a dive, Chief Executive Officer Ken Lay was e-mailing concerned employees, advising them to hold their shares and buy new ones.

Meanwhile, Lay cashed in \$103 million of his own shares in the company. Enron executives unloaded nearly a billion dollars worth of stock while employees were locked out of selling the holdings in their pensions during much of the period in

which the company's stock fell from \$80 a share to \$0.30. Enron investors collectively lost about \$60 billion, which included many large pension plans and the retirement savings of up to 20,000 Enron employees.

Enron turned out not be an isolated incident and the list of companies touched by financial scandal soon included Tyco, Global Crossing, Quest, WorldCom, Xerox, Adelphia, MicroStrategy, ImClone, and homemaker Martha Stewart, AOL-Time Warner, K-Mart, and some major banks, such as Citigroup and J.P. Morgan Chase.

In terms of violence committed by the elite, environmental pollution, unsafe working conditions, and unsafe products have all produced scores of deaths and injuries. Thousand of workers die each year due to the acts of their employers, but rarely is their criminal liability. The felony is an exception. In September 1991, a fire destroyed a chicken-processing plant in Hamlet, North Carolina. When the 100 employees in the plant tried to escape, they found that the company executives had ordered the doors locked "to keep out insects and to keep employees from going outside for coffee breaks, or stealing chickens." Twenty-five workers died in the fire; some were found burned to death at the doors they couldn't open. Another 50 were injured.

The owners of the company and two plant managers were charged with involuntary manslaughter. The outcome: The owner pleaded guilty and was sentenced to 10 years and 6 months in prison. Some people may not think this is a severe enough punishment for someone responsible for 25 very painful deaths, but note three revealing facts. First, the sentence was "believed to be the hardest judgment over handed out for a workplace safety violations." Second, as part of the plea agreement, the involuntary manslaughter cases against the two plant managers were dismissed, though they surely knew that he doors were locked and what the risks were. And third, the owner eventually served a little more than four years in prison and was released. Such a person sentenced is an exception to the rule.

Elite crime is not prevalent only in the corporate world: During the 1960s and 1970s federal agencies, including the executive branch, Central Intelligence Agency, and Federal Bureau of Investigation (FBI) illegally tapped phones, and violated many civil liberties of those involved in the civil rights movement and anti-Vietnam war movement. Perhaps the most elitist position in the world, the

The concept of elite crime: The man above is convicted of \$250 million in stock fraud, while the man at right ...

U.S. presidency, is not immune, either. Former President Richard M. Nixon resigned due to the white-collar, elite crimes he committed during his presidency, including Watergate. J. Edgar Hoover, head of the FBI, was a major player in promoting and overseeing such illegal activities against the civil rights movement and anti-war movement.

Elite criminals usually are not arrested, and if convicted get much more lenient sentences than working- and lower-class criminals. On July 11, 2002, at a hearing of the Crime and Drugs Subcommittee for the Senate Judiciary Committee on the subject of "Penalties for White-Collar Crimes: Are We Really Getting Tough on Crime," Senator Joseph Biden, Jr. (D-D) said:

Under federal law, if ... you steal a car out of my driveway and you drive it across the state line into Pennsylvania, ten years. Ten years, federal guideline. You take a pension by violating ERISA, the federal system to safeguard pensions, misdemeanor, and maximum one year. The pension may be worth \$1,800,000. My car may be worth \$2,000.

The simple fact is that many people believe the American criminal justice system reserves its harshest penalties for its lower-class clients and puts on kid gloves when confronted with a better class of crook.

... is convicted of stealing a \$2,500 car from his employer. Which man will serve significant, hard time in prison?

## embezzlement

EMBEZZLEMENT IS A wide-ranging offense that involves the misappropriation or destruction of money or property with which a person has been entrusted. Virtually any property, including animals and trade secrets, can be embezzled. Its etymological origin has been traced to the French *embeiseller*, which means to destroy or to make away with. The offense runs a gamut from willful failure to return a rented DVD movie to a multimillion dollar theft by

an employee of a large corporation. Under most circumstances, embezzlement should be one of the simplest crimes to commit because there are very few easier ways to obtain money without working for it than retaining someone else's property, which is already in one's possession or control.

The crime we now know as embezzlement originated in England as a common law offense in 1473 based on the Carrier's Case, which involved the theft of bales of wool by an agent while transporting them to the coast. This was the first time that an agent who stole goods placed in his care could be criminally prosecuted. Prior to the Carrier's Case, no "trespass" or usurpation of the goods (the essential element of larceny at the time) could be shown in a theft-after-trust because the goods were considered to be in the legal possession of the thief.

Carrier's Case may be seen as an example of "structural Marxism"—when laws are enacted in order to promote the viability of a capitalistic economic system. If the precedent in Carrier's Case had not been created at the time that it was, the establishment of English and other European trade routes of the 15th and 16th centuries would have been severely retarded; there would be no recourse for theft-after-trust by transportation agents. Carrier's Case was absolutely necessary to promote the growth of those economies.

The first statute outlawing embezzlement was not enacted until 1529. Embezzlement statutes originally specified trust theft from specific victims (the military, banks, post office, a servant's employer), and then evolved into the modern general definition of wrongful conversion of entrusted property.

#### PROBLEMS IN APPLYING LABELS

Embezzlement is a crime of specific intent in which a person purposely misappropriates, misapplies, or destroys something that has been legally entrusted to that person but which she does not own, thereby usurping the legal owner's control. Embezzlement is essentially interchangeable with the crime of criminal conversion because both are defined in terms of theft-after-trust. Criminal conversion is often an essential element of embezzlement, and some jurisdictions have only conversion statutes by which to punish embezzlers. If any difference exists between embezzlement and criminal conversion, it is that in embezzlement the thief usually holds a fiduciary relationship to the victim, such as trustee,

guardian, agent, or employee. Persons charged with embezzlement need not hold such a relationship, and persons charged with criminal conversion may indeed meet the requirements of a fiduciary.

To complicate matters further, embezzlement is usually differentiated from fraud according to the exact moment at which the intent to steal (*mens rea*) was present. If the intent existed prior to possession of the property stolen, then the offense constitutes fraud rather than embezzlement. This is also known as "bad faith" embezzlement because before the thief takes possession of the goods there is intent to steal them. "Good faith" embezzlement, on the other hand, is true embezzlement, and involves taking possession of the goods without having criminal intent to steal them, but such intent materializes sometime after possession of the goods has occurred.

Many persons have been convicted of embezzlement even though they formed the intent to steal before gaining possession of whatever was peculated. Larceny is a lesser offense compared to embezzlement, but necessarily included in it. Stealing from another's cash drawer to which one has legitimate access is embezzlement, but this scenario is often punished as larceny. Embezzlers, then, are often incorrectly charged with offenses instead of embezzlement or criminal conversion.

#### WHITE-COLLAR EMBEZZLEMENT

Edwin H. Sutherland referred to embezzlement as an example of white-collar crime when he first coined the phrase in 1939. White-collar crime for Sutherland referred to crimes committed in the course of occupation by persons with high social status. He continued to equate embezzlement and white-collar crime in virtually all of his later publications on the subject.

However, embezzlement is committed in many circumstances which do not meet the criteria for a white-collar crime, either in terms of the offender's high social status or the criminal opportunity arising in the course of occupation. In the first major research work on embezzlement—*Other People's Money* (1953) by Donald Cressey—it was found that, as a group, the trust violators in the study could not be considered white-collar criminals because they lacked the requirement of high social prestige. Similarly, Dorothy Zeitz, who studied female embezzlers, did not find that the women could

be characterized as having high social status. It is significant that neither of these two major research studies on embezzlement referred to their trust violators as white-collar criminals. Technically, then, using Sutherland's original conception, embezzlement can only be considered a white-collar crime when persons commit a theft-after-trust while they are, in Sutherland's terms, wearing "good clothes at work."

Perhaps the most telling difficulty in pinpointing the relationship between embezzlement and white-collar crime is revealed in Sutherland's belief that white-collar crime is fundamentally organized crime. He believed this because legal definitions of white-collar crimes often necessitate an organized conspiracy or collusion—such as in price-fixing, bid-rigging, commercial bribery, industrial espionage, and physician fee-splitting. Further, he believed that persons working on behalf of large corporations were formally organized both in their attempts to control legislation governing their business behavior and efforts to influence the selection of regulatory administrators who enforce laws against them.

Sutherland also discussed "informal" organization of white-collar criminals, referring to business moralities that run counter to the law. Entire industries or professions—or major segments of them—are often characterized by beliefs that favor the violation of legal norms, thereby tacitly encouraging the commission of white-collar crime. Some white-collar criminals who violate the law are not chastised by their counterparts and peers because so many engage in the same or similar illegalities—thus, they are "informally" organized around legal violations.

The vast majority of embezzlements, on the contrary, are unlike other "organized" white-collar offenses because they lack criminal organization. First, the legal definition of embezzlement does not require collusion. Second, occupational embezzlers as a group are not formally organized to avoid criminal labels for the behavior.

Third, embezzlement lacks "informal" organization, for it can hardly be said that the crime is promoted by widespread business beliefs that encourage it. If anything, embezzlement is most associated not with organized offenders but with organized white-collar victims.

To illustrate, Sutherland referred to embezzlers as the most foolish of all white-collar criminals be-

cause they are relatively powerless compared to their victims. Relatively little embezzlement, then, is white-collar crime according to the original conceptualization of the term because it has nothing to do with Sutherland's three criteria (criminal organization, high social status, occupational opportunity). Anyone with entrusted property or ideas of any kind can commit embezzlement.

Although they represent a very small proportion of all embezzlements, there are some instances where Sutherland's three conditions for white-collar crime have been met. As an example, Henry Pontell and Kitty Calavita describe collusive frauds involving savings and loan financial institutions during the 1980s that led to "collective embezzlement." These offenses were very organized and always collusive, involving an inside officer or employee who violated trust by knowingly approving illegal loans, deriving financial benefit. Whereas typical corporate crime involves the use of the organization's resources to commit crimes against consumers and other organizations, Pontell and Calavita point out that collective embezzlers use the organization to commit crimes for their benefit.

#### AGGREGATED EMBEZZLEMENT DATA

The primary source on the extent and characteristics of embezzlers in the United States is the Uniform Crime Reports (UCR), compiled annually by the Federal Bureau of Investigation from data submitted by state and local police departments. The UCR does not record embezzlement offenses. However, embezzlement is classified as a Type II, or "non-index," category in the UCR, which means it is reported only in terms of the number of persons arrested for embezzlement, and their basic demographics (race, sex, and age). The annual number of arrestees for embezzlement is far less than the numbers for most other offenses.

The UCR definition of embezzlers includes those involved in any "misappropriation or misapplication of money or property entrusted to one's care, custody, or control." As such, the UCR category contains embezzlers and criminal converters, regardless of their social prestige or whether their crimes occurred in the course of their legitimate employment. It would also include trust violators without regard to whether the offender first took possession of the stolen property in good faith. Because this category for embezzlers includes all types

of trust violators, it is inappropriate for scholars to represent it as indicating any involvement in white-collar crime, whether in numbers of arrestees or in terms of involvement by race, sex, and age.

## EXPLANATIONS OF EMBEZZLEMENT

The platitudinous (and sexist) “cause” of embezzlement has been variously termed “wine, women, and wagering,” “bookies, babes, and booze,” and “slow horses and fast women.” These are, of course, motives for stealing rather than explanations for it. Cressey has noted that when people tell you “why” they embezzled—that is, their motives—they do not explain why they embezzled. In searching for a fresh approach through the use of “analytic induction,” Cressey revamped hypotheses until he reached a four-step process that he believed explained the crimes of all 133 federal embezzlers he studied in his classic work *Other People’s Money*: 1) there exists a nonsharable financial problem, a problem that the offender is ashamed or afraid to share with others and for which legitimate sources of money are unavailable; 2) embezzlement is seen as a means for solving the problem; 3) the offender possesses the technical knowledge to carry out the theft; and 4) the criminal behavior is neutralized to be acceptable or to reflect general nonresponsibility of the offender. For example, the money was “borrowed” rather than stolen, the victim mistreated the offender and deserved to be victimized, the money belonged to the offender anyway, or the offender had personal issues.

There are at least two problems with Cressey’s methodology. First, it is based upon incarcerated offenders who are several stages removed from the offense itself—not all embezzlers are discovered, arrested, charged, convicted, or given a disposition of imprisonment, and attrition will occur at each of these stages. His group, then, cannot be claimed to be representative of good faith occupational embezzlers. Second, after arriving at his analytically induced four-step process—rather than using the more straightforward method of strict hypothesis testing—Cressey may well have forced his interpretations to fit his theme.

Cressey has essentially agreed with this latter criticism when he stated in *Other People’s Money* that there is no positive answer to the question of whether he neglected or unwittingly distorted negative cases. Later researchers have come across many

instances in which Cressey’s motive of the non-sharable financial problem was not a universal precondition to the offense. For men, a taste for a more affluent lifestyle—that is, greed—also proved to be a major motivator to embezzlement. For women, stealing was seen as a way of meeting the basic needs of their families or of retaining or regaining the affectations of a mate. Each of these motives was perceived by the actor to be a financial need, but they were not necessarily pressing monetary problems.

Thirty years after his original research, Cressey concluded that although the non-sharable financial problem was not critical, the neutralization of the criminal nature of the behavior was his most salient finding. However, many of the embezzlers in others’ research freely admitted that they knew that embezzlement was wrong before they committed it and they did not feel any need to neutralize. Women embezzlers have stated that there was no need to neutralize because they were simply fulfilling expectations ingrained since childhood that mandated they take care of their families and mates.

Two other theories, differential association and self-control, deserve mention because, unlike Cressey’s attempt to explain embezzlement specifically, these theories purport to describe factors characteristic of criminality generally. Sutherland’s differential association, briefly stated, hypothesizes that crime is a function of learned moralities from significant others. The extent to which persons learn values that favor a criminal act over those that disfavor it will dictate whether they commit a crime. Differential association also states that techniques for committing crimes are learned from other criminals.

In *Other People’s Money*, Cressey initially set out to ascertain whether differential association explained embezzlement. The effort was understandable because Sutherland was Cressey’s dissertation mentor for *Other People’s Money* and insisted that differential association was the most plausible explanation for all white-collar crime.

Cressey abandoned differential association early in his study as a root cause of embezzlement because his research contradicted two main ideas of differential association: that embezzlers should be directly socialized into criminal behavior by other thieves and that they should learn the techniques for committing it from other embezzlers. Many of Cressey’s embezzlers did, however, learn neutraliza-

tions favorable to the violation of law from non-significant others when, through contact with co-workers, they came to believe that some business crimes were merely technical violations rather than morally wrong.

Michael Gottfredson and Travis Hirschi's self-control theory would support an explanation of embezzlement if people who commit it also commit a lot of other lower self-control behaviors. An important corollary to the theory is that people who lack self-control are likely to be versatile in their immediate gratification behaviors, both criminal and noncriminal. That is, they will be more involved in theft, violence, accidents, unsafe sex, gambling, drug and alcohol abuse, lying, poor work performance, cheating in college, and any other behaviors that do not defer immediate gratification. Put simply, if self-control theory is correct, then embezzlers must engage in criminal and other deviant behaviors more frequently than those who do not embezzle.

Self-control theory would point, at least anecdotally, to the "wine, women, and wagering" problems, debt-ridden finances, and other lower self-control behaviors (and neutralizations) that are so well associated with embezzlers. More systematic empirical evidence, however, is found in one study of the official arrest records of embezzlers—two-thirds had at least one other arrest. Of them, four-fifths had an additional arrest for a theft crime, a third had an additional arrest for a crime of violence, and a third had a drunken driving arrest. The average number of arrests for the group was six and the median was four.

## CONCLUSION

Embezzlement involves the criminal violation of trust and is a common law offense that can be traced back to the late 15th century. It can be seen as a heterogeneous offense category because it includes acts that are chargeable under numerous criminal statutes, including embezzlement, criminal conversion, fraud, and larceny. Because trust violators commit theft both occupationally and otherwise, and because they represent persons of varying social prestige, the offense category is not in line with the original meaning of white-collar crime. Except in a few isolated cases, embezzlement also lacks criminal organization, which is another criterion for white-collar crime. Because centralized data sources

include this hodge-podge of violators, those sources are inappropriate for the study of white-collar crime. Regardless of the motivation to embezzle—be it a financial problem, greed, gambling debts, or simply the elevation of one's lifestyle—the need is perceived to be real enough to prompt involvement in the offense.

Neutralization of the wrongfulness of embezzlement is often a precursor to participation in the offense, but one need not learn excuses from others, or learn the techniques to commit the offense from others. Persons charged with embezzlement are very likely to be involved in a wide variety of other criminal behaviors.

## employee crimes

IN THE FIELD OF CRIMINOLOGY, the term employee crime, commonly referred to as occupational crime, is generally agreed to be a subtype of white-collar crime. Beginning with the coining of the term white-collar crime by Edwin H. Sutherland, the broader concept of white-collar crime has been subject to numerous definitional revisions.

For example, it is well known that Sutherland's definition of the term was "a crime committed by a person of high status and respectability, in the

course of his occupation.” This definition immediately calls attention to the fact that the white-collar offender is by nature, legitimately employed. Although it focuses on the characteristics of the individual offender, Sutherland’s most extensive study of white-collar crime actually focused on sanctions against entire organizations, rather than separate individuals.

As a result, the distinction between corporate and occupational crime emerged: corporate crime was considered to be a crime that is committed on behalf of the employing organization, while occupational or employee crime was considered to be committed against the employing organization, to the benefit of the individual. Some debate about this distinction has emerged in the field, mainly in the concern over what types of occupations should be studied. This issue is related to Sutherland’s original concern with the status of high-class, respectable individuals, particularly with regard to the fact that their characteristics often render them immune from legal action.

In spite of ongoing definitional disputes, the distinction between the two forms of white-collar crime has generally been accepted. Researchers studying employee crime may focus on specific occupations, or choose to include a wider variety of offenses that may occur equally often in different occupational settings. Broader conceptualizations of employee crime tend to incorporate a large number of acts that share the characteristic of violating trust: the individual employee violates his or her employer’s trust by engaging in acts that directly or indirectly victimize the place of business.

## TYPES OF CRIME

The Integrity Center, an organization that conducts risk-management assessments for employers, has identified several offenses that are consistent with employee crime. One such offense that may occur in a variety of settings is espionage, which is defined as: the theft or unauthorized acquisition of secret or restricted information. The purpose of industrial espionage is usually related to the acquisition of unique and profitable information belonging to a commercial enterprise. Another common form of employee crime is referred to as kickbacks. Kickbacks are various payments or favors that are given clandestinely to decision-makers in return for selecting the offender’s products or services. Exam-

ples of kickbacks may vary considerably based on the particular industry involved, but could include such common categories as money, gifts, or personal favors.

Fraud is also a general type of employee crime, and can take numerous forms. The Association of Certified Fraud Examiners (ACFE), a leading authority on the topic, has conducted extensive research on what they have termed occupational fraud. This offense is broken down further into three categories: asset misappropriation, corruption, and fraudulent statements. Each of these categories contains yet additional subcategories based on the strategies used to commit them and on the resulting gains (financial or non-financial) for the individual offender.

For example, asset misappropriation, the most common type of occupational fraud, generally consists of one of two forms: cash or other assets. According to research conducted by the ACFE, cash is the asset most often targeted by employees. Misappropriation of cash may occur at all levels of an organization. Corruption, similar to kickbacks, involves collaboration between an inside employee and one or more outsiders in an attempt to defraud the employer in some way that benefits the individual offender. Fraudulent statements, which typically occur at higher levels of organizations, also tend to take one of two forms: the falsification of an organization’s financial statements (for example, overstatement of revenue) or, alternatively, falsification of other documents or records (for example, information in the employee’s human resource file). All of these forms of occupational fraud are violations of trust, and all victimize the employer.

## RELATED CRIMES

Related types of occupational crime include embezzlement, pilferage, and theft of services. The common conceptualization of embezzlement is the taking of money or property by an employee who has been entrusted with its care, custody, or control, which is consistent with the ACFE’s description of asset misappropriation. In the field of criminology, one of the most detailed studies of this type of employee crime was conducted by Donald Cressey, published in his popular 1953 book, *Other People’s Money*.

In this study, Cressey conducted extensive interviews of convicted embezzlers serving time in fed-

eral prison, and found that these former employees had many similarities. All of the offenders were trusted by their employers with money or property. Many of them also identified the fact that they were experiencing a “non-shareable financial problem” at the time of the embezzlement, such as debt due to gambling, blackmail, or womanizing. Many of the offenders also provided common rationalizations for their embezzlement, such as the idea that they were simply borrowing the money from their employer with the intent of eventually repaying it. As a result of this and similar rationalizations, embezzlers did not think of themselves as criminals.

Unlike embezzlement, the employee crime of pilferage generally does not involve the taking of money, but instead refers to smaller scale thefts of relatively inexpensive materials. For example, it may include tools, various office supplies, or other items owned by the employer. Although pilferage is typically viewed as a low-level employee crime, over

*Asset misappropriation, or stealing from the till, is one form of occupational or employee crime.*

time the costs due to this offense can amount to considerable losses for the employer. A similar employee crime is referred to as theft of services. This particular offense consists of the unauthorized use of, or failure to pay for, various services obtained through the employer. Common examples may include making long-distance phone calls or personal photocopying at the expense of the employer.

Other types of employee crimes may be grouped together based on the fact that they involve a similar type of employee: an individual who is bored, feels overworked, has an unresolved dispute with the employer, or is attempting to gain an unfair competitive advantage over her co-workers. Four such employee crimes discussed by the Integrity Center are sabotage, robbery, burglary, and larceny, all of which have a legal counterpart definition.

The broad definition of sabotage consists of a variety of actions, such as the deliberate destruction of property, that are intended to impede the employer's operations in some way. Comparatively, the employee crime of robbery is distinct in that it tends to involve actual force or the threat of force against a victim. Employees may rob their fellow employees, outsiders, or could even give information to outsiders who may use it to rob employees or the organization. Burglary, a related employee crime, entails an employee entering a building or vehicle in an unauthorized manner, and either stealing something tangible or committing another serious crime while inside. Like robbery, burglary can be directly committed by an individual employee, or could also involve a situation whereby the employee provides information to an outsider, who then will physically commit the offense.

Larceny is generally defined as stealing something from a place where an individual has a legitimate right to be present. In the common definition, larceny may consist of a customer shoplifting from a business. Alternatively, and perhaps even more dangerous to employers, is theft by employees themselves. This type of employee crime is also referred to as “shrink” because it involves missing or unaccounted-for inventory. Like all previously described employee crimes, larceny victimizes the employer and can result in large losses, financial and otherwise, over time.

Finally, a newer type of employee crime is any offense that is related to technology, particularly computers. Crimes committed with the use of a computer may be related to or occur in combina-

tion with any of the previous forms of employee crime. Other employee crimes specifically involving the use of a computer include altering data as it is entered into a computer, removing data from a system, or releasing confidential data to unauthorized third parties.

## FIGHTING EMPLOYEE CRIME

What can businesses do to protect themselves from being victims of employee crime? Several strategies have been proposed. Employers may be well served by defending themselves at the pre-employment stage. They can take a variety of steps in the hiring process. For example, one option is to conduct a criminal background check on potential employees. Such checks are relatively simple to perform, and may be conducted by the organization itself or through consultation with a reliable outside agency.

A criminal background check may determine whether a potential employee has any previous arrests or convictions for crimes that may be related to the workplace. For instance, a previous theft conviction may suggest that a potential employee is not an appropriate candidate for a position that involves the handling of money. Employers can use information from criminal background checks to develop general or specific hiring policies. They may decide to bar potential employees who have any prior criminal involvement (even offenses that do not appear to be related to the workplace), or enact a more specific policy that prevents employment of individuals with prior work-related offenses. In conducting background investigations, however, employers should proceed with caution and not rely on a criminal check alone to make a hiring decision. Recent research on this topic has suggested that some individuals may have extensive histories of employee crimes, but this information will only be detected in a criminal background check if the individual's prior employer took legal action against the offender.

All too often, employers may choose simply to dismiss the offender due to fear of negative publicity or to avoid the expenses of a criminal trial. When conducting background checks, employers should also carefully check prior references in an attempt to uncover any relevant information that may go undetected by a criminal check. When employers choose to severely punish offending employees, they can also ensure that future businesses will de-

fect the behavior in subsequent criminal background checks.

To prevent crimes by existing employees, businesses have a number of potentially useful options. In the past decade, technological advances have made the prevention and detection of employee crimes easier to accomplish. One readily available technique is the installation and use of closed-circuit television monitors. Cameras can be installed at a variety of locations: randomly, throughout a business, or even directed specifically at a location where cash transactions take place, such as above a cash register or customer service counter. This type of preventative technique is common in retail settings, and also serves to detect crimes committed against the business by the general public (such as shoplifting). This option involves close monitoring by a trained security team, and immediate action when a crime is detected. The enactment and publication of strict security policies, such as an automatic report to local police and/or a 100-percent prosecution policy may go a long way in deterring the potential employee criminal from acting.

One of the problems with employee crimes is that many of them are not so easily detected through procedures like cameras that may regularly catch common shoplifters. For example, corruption and fraudulent statements, two forms of occupational fraud, may often involve transactions that are not obviously witnessed. Several options are still available to detect such offenses. One potentially beneficial strategy is the implementation of an anonymous reporting system so honest employees can tip off the employer about the criminal activities of other employees. An anonymous reporting system could consist of a 24-hour, toll-free hotline that employees could call when they are away from work, or it could also take the form of a suggestion box or random survey where no identifying information is required. Regardless of the format, anonymous reporting systems can encourage employees to report crimes without fear of retaliation by the offending employee.

In addition to background checks and anonymous reporting, research by the ACFE has revealed that two other practices may be useful in the detection of employee crimes. These mechanisms are internal audits and external audits. Both serve a similar function, which is a thorough assessment and reconciliation of a businesses' financial accounts, documents, or related information. While

both internal audits and external audits could benefit the organization, the internal audit may be ineffective if it is related to the source of the crime itself. An external audit by a non-related, third party, especially if it is conducted unannounced, may be more useful for the discovery of employee crimes.

In the balance of severity and harm caused by white-collar crime, employee crimes rank, for the most part, as almost innocuous compared to the staggering cost in lives and money of corporate crimes, those committed not necessarily by employees, but more likely, employers.

## employee safety

EVERYDAY millions of Americans go to work with the expectation that they will return home unharmed. However, this is not the case for everyone. In 2001, there were 5,900 worker-related deaths and 5.2 million injuries and illnesses according to the Bureau of Labor Statistics. The rate for 2001 fatalities, injuries, and illnesses was the lowest since the bureau began collecting this information in the early 1970s, but the rates, most scholars agree, are still unacceptably high. Many of these cases are caused by egregious and willful safety violations. It is very rare for employers to be held criminally liable, let alone be imprisoned, for violation of state and federal safety laws.

The Occupational Health and Safety Administration (OSHA) is the main federal regulatory

agency charged with the health and safety of workplaces for employees in the United States. OSHA was created in 1970 from the Occupational Safety Health Act (OSHA act). The act's stated goal is to ensure that every working person and woman in the United States has safe and healthful working conditions. The law has given employees a wide range of rights. One of these rights requires companies to reduce risks in the workplace, and if there are risks, then employees have the right to fight for their health and safety.

During the 1980s, OSHA's budget was drastically cut and this had a major impact on the ability of OSHA agents to conduct inspections. Inspections are the main tool used to make sure that companies comply with safety standards that are set for each industry. In 2003, OSHA had 1,123 inspectors who were charged with overseeing approximately 7 million worksites that employ over 111 million workers. OSHA had 1,388 inspectors in 1980.

The United States has seen an increase in worksites and employees but a decrease in the number of inspectors. Because OSHA is so strapped for inspectors, it allows many of the states to take over this responsibility. Section 18 of the Occupational Safety and Health Act of 1970 encourages states to develop and operate their own job safety and health programs. OSHA approves and monitors state plans.

The OSHA act provides for criminal sanctions in various situations. If an employer willfully violates a standard, rule, order or regulation which causes the death of an employee she may be held criminally liable. If an employer makes a false representation regarding compliance with the OSHA act this too may make him criminally liable. Employers may be subject to civil and criminal fines and, in rare instances, imprisonment. A willful violation is a voluntary action that is done with either intentional disregard of or with plain indifference to the statutory requirements. Malicious intent is not required to impose liability.

#### CASE HISTORIES

Some historical cases of willful violations include particular industries, like coal mining, asbestos, and many textile factories. One of the first major coal mine disasters of the television age occurred in 1968 when 78 men were killed in an explosion in a coal mine in Farmington, West Virginia. The igni-

tion source that set off the original explosion never could be determined. However, investigators did find a classic combination of factors, including inadequate ventilation, inadequate control of explosive methane gas and coal dust, and inadequate testing for methane, that could have set the stage for the explosion.

The use of asbestos and its harmful effects have also created unsafe working environments. Many of employees who had asbestosis, a type of lung cancer, have sued Johns-Manville, a major manufacturer of asbestos. Court documents confirm that Johns-Manville knew of the hazards associated with asbestos and intentionally kept the information from its employees. In fact, the asbestos industry had a long-standing policy of suppression. The industry did not warn workers of the dangers of asbestos exposure until 1964.

Textile workers in North and South Carolina have had high rates of byssinosis, an irreversible respiratory disease caused by the ingestion of textile fibers, like cotton dust. In 1980, an estimated 35,000 workers were inflicted with this deadly disease. Working in a factory can be dangerous work, but when one is not told of the dangers or is fired for organizing protests of unsafe work conditions, then this may be criminal. Many executives in the textile industry spent decades denying the very existence of byssinosis. In some cases, the factories would hire company doctors who were told to tell employees that they were fine or simply had bronchitis. Many of the employees had no understanding that their illnesses were caused by the industry's criminal negligence in not creating a safe working environment.

There have been several cases where owners and managers have been held criminally liable under state law for willful violation of safety standards, but these are atypical. Two specific instances of successful criminal prosecution include the Film Recovery Systems, Inc. and Imperial Food Products cases. On June 14, 1985, Steven O'Neil, Charles Kirschbaum, and Daniel Rodriguez, agents of Film Recovery Systems, Inc. were convicted of murder in the death of Stefan Golab, an employee, from cyanide poisoning. In 1990, on appeal, their case was reversed and remanded for a new trial. On September 7, 1993, the three former employees entered guilty pleas of involuntary manslaughter.

In September 1992, the owner of Imperial Food Products, Emmett Roe, age 65, pleaded guilty to in-

voluntary manslaughter and was sentenced to 20 years in prison for his responsibility in the deaths of 25 of his workers.

State and federal regulatory agencies like OSHA can only do so much given the lack of budget and inspectors. It is the responsibility and legal duty of an employer/company to create and maintain a safe working environment for employees.

## Enron Corporation

ACCOUNTING FRAUD CAUSED the seventh-largest corporation in United States to fall victim to white-collar crime. Its demise was due to accounting practices in violation of Securities and Exchange Commission (SEC) regulations. It is the classic case of the devil is in the details. From its founding in 1981 until the late 1990s, Enron was a dynamic, expanding energy corporation. The larger it grew, the more it diversified.

The accounting fraud at Enron was complex, but it is why it collapsed. Enron annual reports to shareholders stated very high earnings but kept nearly all its debt off the annual reports by stating in a footnote that a special purpose entity (SPE) covered the debts. The use of special purpose entities is a legitimate practice but there are federal regulations that were violated by Enron. A special

purpose entity guarantees a debt for a price, which is its profit. First, though, it must have the assets to cover the debt. Second, SEC regulations requires it to be headed by a person not connected with a corporation which covers the debt. Third, investors in the special purpose entity must have sufficient capital at risk. None of these regulations were observed for the SPEs created by Enron officials.

Enron's chief financial officer, Michael Fastow, created special purpose entities incorporated under the names LJM 1 and LJM 2 (his wife's and children's initials) among others directed by different Enron officials. These SPEs were just post office boxes and bank account numbers in the Cayman Islands. Fastow was president of both SPEs while at the same time an Enron executive in violation of SEC rules and Enron's own internal code of ethics. LJM 1 and LJM 2 had no capital at risk. Their entire assets were Enron's own money backed up by its stock. Fastow transferred hundreds of millions of dollars to LJM 1 and LJM 2 every year from 1997 to 2001. It was deposited in LJM accounts and returned to Enron minus the fee for covering Enron's debt. The fee included Fastow's salary as president of the SPEs and dividends for SPE shareholders. The amount returned to Enron was then listed in the revenue column on the annual report and debt in a similar amount erased from the liability column. As a result, Enron's annual report showed very high income and virtually no debt, making it very attractive to investors.

The prudent decision would have been for Enron to use its high income to pay its debts. However, that would have left much less for shareholder dividends and would cause stock prices to advance at a slow rate based on the actual profitability of the corporation. Fastow and other Enron executives were major shareholders. Every year, 1997 to 2001, stock prices climbed and dividends were paid based on what appeared to be record financial performance.

In reality, the debts grew ever larger year to year until they reached \$1.2 billion. At that point Enron declared it must revise its financial statements. As its stock value fell and the SPEs had no assets, bankruptcy was the unavoidable consequence.

On January 13, 2004, Fastow pleaded guilty to two felonies, becoming "the highest ranking officer at the company to admit to participating in crimes that contributed to Enron's collapse into bankruptcy protection more than two years ago," the

*New York Times* reported. In his plea, Fastow admitted he had worked with other executive officers of Enron, including possibly Chief Executive Officer Ken Lay, "to disguise Enron's deteriorating financial health, as well as engaging in a scheme to defraud Enron of millions of dollars for his own benefit."

The business media reported prosecutors recommended that Fastow serve a 10-year sentence, the maximum under the two counts to which he pleaded guilty. The former chief financial officer faced an additional 96 counts, and settled related civil charges with the SEC. Fastow agreed to surrender more than \$23 million in civil and criminal penalties. The deal with Fastow led prosecutors to believe they had reached high enough into the Enron corporate suite to determine whether Lay or other chief executives were involved in Fastow's creative bookkeeping.

## Environmental Protection Agency

BEFORE THE Environmental Protection Agency (EPA) was created in 1970, earlier legislation had been enacted to protect the environment. However, these laws were weak, and poorly managed and enforced.

The first environmental law in the United States was called the Rivers and Harbors Act of 1899 or the Refuse Act. This law was primarily designed to bar companies from discharging garbage

into navigable waterways. Clearly, this first law was aimed at protecting commerce not the environment. However, two later Supreme Court decisions mandated that dumping industrial waste, whether or not it interfered with commerce, was still a violation of the law.

In the 20th century, the first environmental law was the Federal Insecticide, Fungicide and Rodenticide Act passed in 1947 requiring companies to register pesticides used in interstate commerce. Public concerns about the environment arose in response to the post-World War II burgeoning industrial development and use of chemicals, as well as the nuclear fallout from the use of two atom bombs by the United States against the Japanese cities of Nagasaki and Hiroshima during World War II. This series of new environmental legislation included the Water Quality Act of 1948 and its expansion in 1956 by the Federal Water Pollution Control Act. This act created the Federal Water Pollution Control Administration that would approve new water-quality standards.

#### POWERFUL ENVIRONMENTAL LAWS

Also in 1955, the Air Pollution Control Act was passed. This was followed by the 1958 Food Additive Amendment or the Delaney Amendment requiring the Food and Drug Administration to ban any food additives that were suspected of causing cancer. However, it wasn't until 1962, when a book, *Silent Spring*, written by Rachel Carson was published, reflecting the public's growing concern about the effects of synthetic chemicals on all living things. More powerful environmental laws and finally, the Environmental Protection Agency was created.

In 1963, the Clean Air Act was passed and initially gave the secretary of Health, Education, and Welfare the power to define air quality based on scientific research. Then in 1969, after one of the Great Lakes (Lake Erie) was declared dead as the result of industrial pollutants, and an oil spill off the California coast led to extensive damage to wildlife, the demand for an Environmental Protection Agency was further empowered. In 1969, by executive order, President Richard Nixon created the EPA, designed to enforce the new 1970 Clean Air Act. The EPA was initially charged with the responsibility of identifying air pollutants hazardous to humans and to publish air-quality criteria through

the National Ambient Air Quality Standards. These standards mandated two levels of protection for health and welfare and required the states to develop similar implementation plans to protect the air. In the early 2000s, many states still had not met the required standards set up by the EPA.

From 1972 through 1982 the U.S. States Congress created or amended a variety of pieces of legislation designed to control and manage polluting industries and sanction, fine, or punish those companies that violated these regulatory laws. All of these laws are administered or enforced by the EPA and include the following:

1. The Resource Conservation and Recovery Act focuses on the control and management of solid hazardous waste products. It is responsible for ensuring that such waste is properly generated, transported, treated, stored, and/or disposed of. Beginning in 1989 under this law, the EPA began producing the Biennial Reporting System (BRS) database that provides the identities of companies producing waste as well as the volume of waste produced by primary hazardous waste generators. However, this list omits a number of facilities.

2. The Toxic Substances Control Act requires pre-manufacture notification of any new chemicals being developed. It requires testing of any chemicals that are not already regulated by the Food and Drug Administration (FDA).

3. The Comprehensive Environmental Response, Compensation and Liability Act is aimed at repairing environmental harms (see below).

4. The Federal Insecticide, Fungicide and Rodenticide Act targets restrictions in the use of pesticides.

5. The Federal Water Pollution Control Act of 1972 was the first major law requiring a comprehensive approach to discharges of waste and led to the development of an extensive permit system.

6. The Clean Air Act of 1970 is designed to define air quality standards and required the EPA to identify air pollutants and publish air quality standards through the National Ambient Air Quality Standards list.

The Pollution Prevention Act of 1987 authorized the collection of pollution data maintained in the Toxic Release Inventory (TRI). The TRI is available on the internet and lists the toxic chemicals transferred or released by manufacturers with more than 10 workers, producing over 25,000 pounds of or uses more than 10,000 pounds of one of the 350

identified toxic chemicals. The TRI includes air, land, water and underground releases. It is the responsibility of the EPA, as the law enforcement agent of environmental laws, to ensure that all industries comply with the requirements by negotiating compliance, and using the administrative or civil law to sanction or fine companies if they do not voluntarily comply with the law, as well as clean up any pollution that they have caused.

As a last resort, uncooperative violators are referred to the Department of Justice for criminal prosecution with penalties that can include fines and prison for responsible company executives.

The EPA is one of the largest of all the federal regulatory agencies. It has 10 regional offices that include environmental attorneys, investigators, and administrators. The EPA is a part of the executive branch of the federal government and is headed by an administrator, deputy, and nine assistant administrators nominated by the president. It should also be noted that the EPA also works with state environmental protection agencies in achieving enforcement functions. Each state negotiates its particular degree of involvement in environmental protection with the federal EPA.

Unfortunately, the EPA has no authority to intervene in the event of hazardous waste or pollution emanating from chemical or nuclear weapons that belong to the U.S. government. These issues remain under the control of the Department of Defense. Moreover, the EPA cannot control U.S. transnational corporations who violate environmental laws when they are operating overseas.

## THE SUPERFUND PROGRAM

In 1980, the Love Canal environmental disaster led Congress to enact the 1980 Comprehensive Environmental Response, Compensation, and Liability Act authorizing the EPA to create the superfund program to facilitate the clean up of hazardous waste sites. This act imposed taxes on crude oil and certain chemicals to provide the capital for the superfund. Unfortunately, as of 2004, it was no longer authorized to gather taxes. However, the previous taxes continue to be received because of past due taxes and Treasury Department adjustments.

A superfund site is authorized when an industrial or individual pollution event occurs and creates a significant danger to people, animals, and the environment. Superfund sites are considered very

dangerous, real threat but another type of site is referred to as a Brownfield. A Brownfield site is defined by the EPA as an abandoned, idled, or underused industrial or commercial facility where expansion or redevelopment is complicated by real or perceived contamination. Such sites do not require clean up as a superfund site does. What remains problematic is that the average site remains on the superfund list for clean up for almost 11 years.

In response to this problem, Congress passed the 1986 Superfund Amendments and Re-authorization Act mandating that superfund sites end up on the National Priority List for clean up within four years of the discovery, although this legislation has not changed the time agenda. Ending up on the National Priority List is the third step of an eight-step superfund investigative process conducted by the EPA, ending in a record of decision and the plan for remedial action.

In addition to the Brownfield list, the Toxic Release Inventory and the superfund database exist to record accidental chemical releases into the environment from fixed facilities. This is called the Accidental Release Information Program Data and any release that may cause injury or death to humans or damage to the soil, water, air, or wildlife must be recorded there. All information relevant to the location, company, and amount of and type of toxins released are specified on the list.

Growing scientific evidence reveals that many polluting industries and superfund sites are near predominantly poor or minority communities. While these blatant forms of classist and racist environmental crime remain permissible by law, some criminologists argue that such crimes are a violation of the equal protection clause of the 14th Amendment. Further evidence of this racism exists in that minority superfund projects are on the National Priority List longer than other sites, and generally take longer cleaning-up than other sites.

In a makeshift effort to address this issue, President Bill Clinton signed an executive order requiring all federal agencies to make environmental equity a part of their mission. In 1992, the EPA created an Office of Environmental Equity, now called the Office of Environmental Justice. This office has commissioned a task force to examine environmental equity issues that oversees the National Environmental Justice Advisory Council, a federal advisory committee of citizens who offer guidance to the

EPA. Additionally, in 1993, the EPA made a series of administrative changes, making the superfund program faster and more efficient. As of 2000, the active site remediation was completed at 43 percent of the National Priority List sites, and 12 percent of sites were deleted from the monitoring program. However, toxic releases and emissions continue to grow and remain problematic across the United States as well as across the globe; many of these releases and emissions contain materials that are carcinogenic.

Internationally, protection of the environment is becoming a protected right of all peoples. The right to a healthy environment exists in international law in the Covenant on Economic, Social and Cultural Rights, which the United States has not ratified. Also, the Rio Declaration is a binding international treaty obliging all nations to recognize the right to a healthy environment; only 34 out of 190 nations have not signed this agreement. In addition, the Montreal Protocol on Substances that Deplete the Ozone Layer has been ratified by 112 nations.

## Equity Funding Scandal

THE EQUITY FUNDING Corporation of America was a life insurance company capitalized in 1960

with a few thousand dollars, which by 1973 claimed assets of \$1 billion making it the first white-collar crime to break the billion-dollar mark. The Equity scandal illustrated there is almost no limit to the dollar amounts that can be fraudulently obtained and can go undetected for over a decade.

Equity fabricated non-existing assets and sold them. To understand how the scheme worked requires noting certain practices in the insurance industry. Insurance companies buy and sell policies they issue to other companies, which is called reinsurance. This spreads risk evenly over all companies so, in the event of multiple claims, they do not fall too heavily on one insurer. For example, consider that one company wrote all of the homeowner policies in Florida and a hurricane caused billions of dollars in claims. It would endanger the company's financial stability to pay them all. But if many companies share the risk, each pays a portion of the large number of claims. The same practice applies to life insurance.

Knowing there is a ready market for life insurance policies among other insurance companies, the founders of Equity Funding forged policies by writing insurance on nonexisting people or "fence posts." Secretaries made up fake names, ages, medical histories, addresses, and premiums on forged applications. When several thousand applications were forged, they were assigned policy numbers and entered into the company computer. These policies were sold to other insurance companies in routine reinsurance transactions for large sums of money. The company buying the policies could expect to collect premiums on some policies for decades.

Of course, in a month the first month's premiums are due and will have to be forwarded to the company that bought the policies from Equity. In the meantime, more fake policies were issued and sold to another company, and the first month's premium due to the first was paid from funds received from the second. Money from the sale of the fake policies went into Equity's account. Since the price paid by other insurance companies was so much higher than the premiums due on earlier policies, Equity's cash assets skyrocketed.

With massive revenue flowing in and only a few employees needed to carry on the fraud, Equity began to legitimize operations by hiring real agents. With the ever-increasing flow of money from forged policies, Equity could offer insurance products that no other company could match. Offers included

life insurance with a cash-value so high, the insured paid virtually no premium for coverage. Sales volume naturally increased giving Equity an ever-expanded market share, causing its stock price to go up on average 166 percent annually. Such a well-performing stock attracts investors. Labor unions invested pension funds and colleges and universities added Equity stock to their endowments. Tens of thousands of private investors made substantial investments.

As Equity sales and stock prices advanced, other companies became worried. They had more agents than Equity, yet they could not write that much insurance. Some reasoned that if given a chance, Equity policyholders would also buy their products. Taking names and addresses from policies that they purchased in reinsurance deals, the companies mailed literature offering Equity policyholders their products. When all offers came back from the post office marked "address unknown," the fraud was exposed.

Equity Funding was shut down in simultaneous actions by the insurance departments of several states. Quick action across the country was necessary to deprive Equity of a chance to cover up the crime. Once the fraud was exposed, holding Equity stock or policies was a total loss to all investors and policyholders.

## ethics

**ETHICS IS A WORD** used to refer to a range of personal decisions relating to issues of morals or principles. It includes issues of morality: what is right and wrong and, hence, how should we live and how should we behave? These questions are clearly

contingent upon culture and dependent upon time and situation. This is because different groups of people profess to believe in the correct way to behave, and promulgate various codes of behavior and values that are claimed to cover all eventualities. These codes often conflict with each other and, from an analytical-ethical perspective, most have some useful content which can help people live together peacefully, but none is sufficient to deal with all the complexities of the modern world.

The range of possible circumstances in which people may find themselves and the decisions they might have to make are so wide that simple definitions are inadequate. Instead, an eclectic approach is required and this helps to explain the tremendous growth of schools of business ethics, with professorial chairs and peer-reviewed journals devoted to the concept.

In the business world, ethics is used in a general sense to refer to the obligations and responsibilities of firms to their stakeholders. Stakeholders are all those individuals and organizations to whom the behavior and existence of the firm is in some ways significant. This can include employees (who rely upon the firm for regular wages), shareholders (who anticipate return on their investments), suppliers of intermediate goods and raw materials (who rely on the firm for their own business survival), and neighbors (who may be affected if the firm causes some form of environmental degradation), as well as many others.

As large firms continue to become internationalized, undertaking different sorts of business activities in different countries, it is clear that they may develop a complex network of stakeholders who, in some cases, will have competing and even contradictory calls on the firm's attention and resources. The need for firms to ensure highest returns for shareholders and investors may, for example, conflict with the interests of employees, when the firm decides to export jobs overseas to countries where labor costs are lower, as in the case of Aviva, which decided that more than 2,000 administrative and telecommunications answer-centre calls were to be relocated to India.

A particular issue of contention has arisen with the growth of importance of the American business model, which argues that the only legitimate purpose of business is the constant pursuit of short-term profit maximization and which is closely associated with conservative thinkers in the United

States and elsewhere. The American business model ruthlessly pits the firm's responsibilities to its shareholders against its responsibility to any other stakeholder, and dictates that the latter must be subservient, no matter what the cost to society and individuals. The interest in business ethics has been further stimulated by these developments.

## CONTEXT

The debate about business ethics has intensified considerably over recent years as a result of a series of factors. These include the distaste shown by the public concerning a series of high-profile financial scandals by firms, combined with reports of excessively high levels of compensation provided to executives, seemingly irrespective of corporate performance. The U.S.-led attack on Iraq in 2003 inspired additional debate about the role of corporate interests in shaping foreign policy, particularly with respect to the president and cabinet's very close linkages with the U.S. oil industry, and the controversial award of reconstruction contracts in Iraq with the suspicion of conflict of interest.

Additionally, the entry into the capitalist market system of the states of the former Soviet Union, and the disaster of the International Monetary Fund (IMF) program of privatization in Russia have also highlighted the need to instill elements of ethical behavior into the market system. Under command economy systems, there is little need for an ethical component since all economic decisions are driven by systematic ideology. However, as has been seen in those countries undergoing transition from command to free market economies (such as in Russia, Poland, and China), alienation of the people from what appears to be a predatory state leads to a high degree of corruption and fraud in business practices.

At the same time, the impact of globalization (defined in this sense as increased availability of international travel and of the distribution of information internationally) has led to the interaction between economic actors from different cultures to a much greater extent than ever before. Not only, therefore, have business people been required to deal with different, and in some cases incompatible, ethical standards in appropriate manners but information about those dealings is now increasingly available to stakeholders around the world. Consequently, legislation has been required to regulate,

for example, the interface between U.S. company representatives and Japanese or Korean employees involved with the gift-giving corporate culture widely prevalent in those countries, which has resulted in the imposition of new guidelines and the redefinition of the concept of bribery.

As more states have become involved in the global trade and investment system, production capacity has also necessarily increased and, as a result, competition between firms has intensified and the focus of competition has switched from production values to marketing values. In other words, marketers are selling products based not so much on what they can do, but on what they look like or what image and status they might provide. Consequently, there is a greater incentive for marketers to stretch the limits of description for their products and this means a greater requirement for ethical standards to which marketers should adhere.

## HISTORICAL PERSPECTIVE

Historically, all major societies have regulated business-state activities by recourse to the dominant religious ideology or ideologies. Combined with specific societal, cultural, and geographic factors, this led to a series of unique relationships between state rulers and those involved in economic activities. Commerce was variously considered to be a rewarding and moral activity (in Islamic societies), a necessary evil best regulated carefully (China and some other Oriental states), or a recourse from persecution for a people unable to own property in many countries (among some Jewish societies).

The interaction of different cultures involved in trade generally led to the creation of markets in which customs and regulations would be blended together in the interests of trading efficiency, while remaining under political control of the domestic government. One example of this was Ayutthaya, in what is now Thailand, where communities of European, Arab, Chinese, Japanese, and other merchants were able to deal with each other under conditions guaranteed by the state.

Through markets such as these, leavened by the occasional external shock of a powerful new entrant into the market who was able to shake up trading conditions, international standards were set in the pre-modern era. Ethical decisions concerned such issues as the degree to which contracts with nonreligionists must be considered valid, and the

implications of using violence to ensure trade routes or in piracy.

In the modern age, improved communications and technology stimulated the creation of international banking and finance, as well as more sophisticated transactions, which necessitated improved methods of ensuring trustworthiness and reputation. Meanwhile, labor standards remained in a rudimentary state and, as a result of the Industrial Revolution and the imposition of colonial empires, grew significantly worse in many cases.

The 20th century saw understanding of the values of human rights, labor standards, and environmental sustainability slowly seep into the business world, although very frequently only after lagging behind legislation. The growth of consumerism and the civil society helped to change the global environment in favor of the rights of people to live free of ideology, whether political or religious, albeit only in some parts of the world. These attitudes inspired firms to engage with ethical concerns on a more genuine basis, and a number of important gains was made in terms of employee safety and rights and in the responsibility taken for the safety of products. However, the progress of these improvements continues to be subject to the prevailing political climate, as some conservatives strive to divorce corporations from social responsibilities.

#### ETHICAL STATEMENTS BY FIRMS

Firms are increasingly coming to include ethical statements of various sorts as part of their corporate mission, or else as some other formal part of their statements of principles. They are motivated by a combination of philanthropy and corporate citizenship, on the one hand, and the desire to deflect unwanted and negative ethical investor attention, on the other. In some cases, the statements appear to be somewhat self-important but visionary, as in Ford Motor Company's 2003 statement:

Our Company was built on values. They helped us succeed to this point and will support the drive to a more sustainable future. To inspire us to make our values come alive in our current business practices we have adopted a set of Business Principles for our next 100 years.

The Samsung Corporation, on the other hand, reveals in a series of mission statements, its role as a

supporter of Korean development and increasing independence of action. At first, its mission was "Economic contribution to the nation," followed by "Priority to human resources" and then "Pursuit of rationalism." Finally, it reached this position in 2003: "We will devote our human resources and technology to create superior products and services, thereby contributing to a better global society."

Samsung's example is one which many other corporations have followed, it and reveals an understanding that it is now necessary to promote the organization as subscribing to a number of values considered important by consumers and stakeholders. However, whether they will actually conform to such standards is much less clear.

#### ETHICAL STANDARDS

Ethical decisions vary according to the functional department in which people are involved and their level of seniority. Functionally, the decisions facing marketing departments are different from those facing accounting or production departments. In the case of accounting, international standards are promulgated and distributed around the world, while the growing acceptance of English as the language of international business is leading toward shared accepted definitions of various concepts and practices. In some functional areas, international or at least national standards of behavior and ethical practice are being established to serve as a filter against poor practice, but also as a barrier to entry for smaller firms.

Managers are required to perform ethically with respect to their duty, their dealing with external stakeholders, and with both their supervisors and subordinates. Depending on their level of autonomy, managers may also be required to make significant decisions concerning the firm's relations with the rest of the world. Country managers, for example, who represent their firm as senior manager in a particular country, may have to make decisions about complying with or rejecting local ethical systems which may appear to be unacceptable. These might include monopolistic distribution systems, payment of commissions or other special payments that may be construed as bribes, or the avoidance of international health and safety regulations.

Employees are also faced with the issue of whistleblowing, which is the practice of alerting the media or regulatory authorities of wrongdoing by

the firm, whether in terms of breaches of safety or labor standards, or else commission of internal fraud or malpractice that may be kept within the organization.

While it is clear that the employee has a moral duty to reveal details of wrongdoing, actually doing this in practice may be made more difficult because of fear of reprisals and job loss. The mixed outcomes of people who have blown the whistle on their employers has led the U.S. government to support individuals through accountability programs.

## THE GLOBAL COMPACT

Since the range of circumstances in which a decision with ethical content may be required is so wide, and the ability of individuals to obtain and process accurately sufficient information to make an informed decision so limited, it is necessary to provide guidance on basic values and moral principles. Many organizations have attempted this and their efforts often reflect their own sets of interests. In other words, they only partially deal with all the issues required of them.

As a result, the United Nations (UN) has attempted to integrate basic building blocks of business ethics into a set of guidelines that has become known as the *UN Global Compact*. In response to a challenge issued by UN Secretary-General Kofi Annan in 1999, a network of organizations and individuals published the *Global Compact* in July 2000 centered upon nine principles relating to the conduct of business as it relates to human rights, labor standards, and the environment:

### Human Rights

Principle 1: Businesses should support and respect the protection of internationally proclaimed human rights within their sphere of influence; and

Principle 2: make sure that they are not complicit in human rights abuses.

### Labor Standards

Principle 3: Businesses should uphold the freedom of association and the effective recognition of the right to collective bargaining;

Principle 4: the elimination of all forms of forced and compulsory labor;

Principle 5: the effective abolition of child labor; and

Principle 6: eliminate discrimination in respect of employment and occupation.

### Environment

Principle 7: Businesses should support a precautionary approach to environmental challenges; and

Principle 8: undertake initiatives to promote greater environmental responsibility; and

Principle 9: encourage the development and diffusion of environmentally friendly technology.

The network of the *Global Compact* works to promote these principles and to extend their meaning into all areas of business decision-making. One particular issue is to provide compelling reasons for firms to participate and follow the guidelines. This involves focusing upon the return on investment that it is possible to obtain from adhering to a stated ethical code, and the need to ensure that published ethical statements are not only being adhered to, but are inherently meaningful and not just another form of marketing fraud.

MAHIDOL UNIVERSITY, THAILAND

## Ethics Reform Act

IN THE LATE 1980s, U.S. Congressional ethics were under extensive public scrutiny, and the result was an environment that was ripe for reform. With the Ethics Reform Act of 1989, which became law in November 1989, Congress established restric-

tions on the ways that federal employees could earn money beyond their government salaries. The restrictions were applied to honoraria, gifts, and campaign contributions. Inevitably, Congressional attempts to ensure ethical behavior on the part of federal employees stirred up controversy in the media and the public.

In the midst of an economic recession, the House of Representatives added a provision to the Ethics Reform Act that increased annual salaries for all members by approximately 51 percent. Supporters of the bill argued that increasing salaries would offset the loss from honoraria and would protect members from being corrupted by special interests. The Senate initially bypassed the salary raise and retained the right to accept honoraria. However, in response to public outcry, at the beginning of the following term the Senate also banned honoraria for Senators and Senate staff, and the House of Representatives voted to eliminate the pay raise. Reactions to the raises at a time of economic crisis contributed to the resignation of Speaker of the House Jim Wright (D-TX) on June 30, 1989.

The Ethics Reform Act also attempted to deal with the ethics surrounding the huge war chests comprised of monies left over from political campaigns. Ten years before, Congress had prohibited members of Congress from converting these funds for personal use. The 1979 law had provided a "grandfather clause" that exempted members of Congress who took office before January 1980. The new act removed that exception, allowing members who left office before January 1993 to maintain control of their war chests. In 1989, 179 members of Congress remained who had been exempted from the 1979 act by the grandfather clause.

#### TAKE THE MONEY AND RUN

Some members chose to take the war chests and leave Congress. Gene Taylor (R-MO), for example, used his war chest to pay automobile insurance, income tax, and to host a party for his Congressional staff. He then donated \$52,000 to charity and wrote himself a check for \$345,000. Others who left Congress with huge war chests were Marvin Leath (D-TX) with \$844,000, Doug Barnard (D-GA) with \$555,000, and Robert Whittaker (R-KS) with \$524,000.

Those who remained in office were allowed to use funds from their war chests to campaign for any

other, entirely different political office than the one for which the money was originally donated.

The Ethics Reform Act also banned government officials, including all employees of the executive and judicial branches and members and staff of the House of Representatives, from accepting honoraria for giving speeches or writing articles. The Ethics Reform Act defined honoraria as "money or anything of value for an appearance, speech, or article, excluding any actual and necessary travel expenses." This restriction, which was added to the bill at the last minute, proved to be so controversial that challenges reached the Supreme Court of the United States. While the intention was to limit the impact of special interests on federal employees and to prohibit federal employees from acting for special interests, the end result was an outright ban on such activity by federal employees, even when the speeches or articles were unrelated to their federal jobs.

The ban had particular impact on the two million or so employees who worked in the executive branch of government. Federal employees who were adversely affected by the ban included a lawyer for the Nuclear Regulatory Commission who wrote articles on Russian history, a mail carrier who gave speeches about Quakerism, a Labor Department lawyer who lectured on Judaism, an aerospace engineer who lectured on African-American history, a Food and Drug Administration employee who wrote dance reviews, and an Internal Revenue Service (IRS) employee who wrote on environmental issues.

After a number of unsuccessful Congressional attempts to lift the ban on honoraria, federal employees brought a class-action lawsuit, claiming that the First Amendment rights of all federal employees had been threatened by the ban on accepting payment for speeches and articles. In 1995, in *United States v. National Treasury Employees Union* (514 U.S. 527), the Supreme Court upheld the rights of federal employees and overturned the honoraria portion of the Ethics Reform Act of 1989 as it applied to employees ranked GS-15 and below.

Writing for a six-to-three majority, Justice John Paul Stevens used the examples of writers Nathaniel Hawthorne and Herman Melville who had worked for the U.S. Customs Service to argue that federal employees should be given the opportunity to make contributions to the "marketplace of ideas."

## extortion

EXTORTION IS A CRIMINAL offense, generally described as obtaining something of value from one party by the infliction of harm, or the threat of that infliction of harm by a second party. Extortion is different from theft; in a theft, the item (a physical object) of value is usually taken without the owner's knowledge and/or permission, so no force is present.

Similarly, extortion is different from robbery; in a robbery, violence is either present or implied, not understood to be a future occurrence. Additionally, most robberies involve the taking of a physical object, not an abstract or immovable instrument, that is, a reputation, future business contracts, or occupancy of a building. Extortion often involves the payment of monies to ensure that violence will not occur, sometimes referred to as protection money.

The generally accepted public conceptualization of extortion is one of two classifications: a politician demanding payments from persons seeking business from a political body (corruption, bribery, graft), and organized-crime figures demanding

money from business owners to avoid physical injury or damage (paying protection). However, extortion exists in many forms, including: individual on individual, individual on public figure/politician, individual on corporation, individual on governmental agency, politician on individual, politician on corporation, labor unions and law enforcement personnel on individual, organized-crime operation on individual, and organized-crime operation on corporation, as well as certain ethnic extortion operations.

Extortive demands made against individuals and corporations, in both domestic and overseas markets, have increased in such regularity that insurance coverage is now offered by several major insurance carriers; insuring such risks as: kidnapping/threat of kidnapping, bodily injury extortion, property extortion, product contamination, and trade-secret extortion. Some insurance carriers note their success in reducing kidnapping payments from the original demands, and usually settling for 10-25 percent of the original demand.

## THE HOBBS ACT

The crime of extortion is often associated with the Hobbs Act, which is defined in 18 U.S.C. S 1951 (b)(2), which describes extortion as the "obtaining of property from another, with or without his consent, induced by wrongful use of actual or threatened force, violence, or fear, or under the color of official right." Certain standards must be met for an act to be identified as extortion under the Hobbs Act and for a person to be charged with violation of the act, including: 1) Did the defendant induce or attempt to induce the victim to surrender property or their rights to that property? 2) Did the inducement include either physical injury or economic harm? 3) Did the action potentially or actually affect, delay, or obstruct interstate or foreign commerce? And 4), was the threat of physical injury or economic harm wrongful—did the defendant have intent to obtain the property or right thereof by the threat of force?

## GANGSTER EXTORTION

Similar to the irony of Al Capone being convicted on tax evasion charges, extortion charges hastened the demise of fellow Chicago gangster, Frank Nitti, who took over for Capone. As the repeal of Prohi-

bition reduced the income opportunities of the Chicago mob, Nitti looked toward extortion as a source of income.

With the placement of key personnel, Nitti's organization gained control of the International Alliance of Theatrical Stage Employees and Motion Picture Operators (IATSE). Monies were extorted from major operators in the motion picture industry, including Louis Mayer and the Warner brothers. In 1943, Nitti and others were charged with extorting over \$1 million from motion-picture operators, and one day after the indictments were issued, Nitti committed suicide, allegedly being despondent over a possible return to prison.

### SPECIFIC TYPOLOGIES

*Individual(s) on individual.* This case type involves individual attempting to extort or blackmail other individuals who are not necessarily public figures. Prior cases have included: a tabloid news editor threatening to report (falsely) that a former police detective's mother had committed suicide if the detective did not give him confidential information on the Jon Benet Ramsey investigation. Rap music personality Mystikal was charged with extortion of a female acquaintance by demanding she perform certain sexual favors in exchange for not having her arrested on an embezzlement charge.

Other examples include anonymous bidders on eBay.com who have demanded extortion payments from other bidders to drop out of the bidding process and not raise the price. A multi-count criminal indictment against Teamsters Local 390 (stevedores) included extortion charges alleging that rank-and-file members were required to make payments to union officials to secure not only employment, but work in certain lucrative locations.

In 2001, the former bodyguard of singer LeAnn Rimes was arrested for attempted extortion, demanding \$2 million from her in exchange for the return of pictures and videotapes, and a promise not to reveal confidential information to tabloid publications.

In May 2001, management of a Somerset, New Jersey, construction company was charged with extortion of its workers as management, in an attempt to circumvent prevailing-rate laws, required workers to kickback part of their salaries to management under the threat of termination if the kickbacks were not paid.

*Individual(s) on public figure/politician.* Numerous cases of this type have been noted in the press, with some involving blackmail, demanding money in exchange for withholding information. Recent publicized cases include: A woman claiming to be the illegitimate daughter of television personality Bill Cosby demanding \$40 million to not sell her story to the news media. A person identified as the paramour of basketball player Michael Jordan demanded \$5 million to keep their relationship from the press.

In August 2003, an individual demanded \$25,000 for the return of \$250,000 of jewelry stolen during a baggage handling incident at New York's JFK Airport. Other examples include a photographer demanding \$3.3 million from actress Cameron Diaz in exchange for the return of some photographs and videotapes of her in an earlier private modeling session.

In March 2003, the U.S. Attorney's office in Miami obtained criminal indictments against 74 owners and operators of Florida household-moving companies, alleging their extortion by adding fraudulent additional moving charges once the furniture was loaded, and refusing to release the shipment until the additional fees were paid. In January 2003 a Rockville, Maryland woman extorted money from persons wanting home repairs; she would identify a victim through her employment at a flooring company, offering to do the job for less, but did no work after accepting money, and once the victim began to complain, physical violence was threatened against the victim and his family.

*Individual(s) on corporation.* These cases involve person attempting to secure something of value from companies by a variety of claims, including: In January 2003, two men demanded a substantial amount of money from the Van Gogh Museum of Amsterdam, the Netherlands, for the return of two early Van Gogh paintings that had been stolen from the museum. A New York City stock analyst threatened to release possibly damaging financial information against a Canadian company official if payments were not made and, after payments were originally refused, he "leaked" part of the information to a local paper and reiterated his demands.

A computer hacker, who identified himself as Maxus, demanded \$100,000 from an online CD company in exchange for not releasing the names and credit card numbers of 350,000 customers he had obtained from the company website. A person

demanded an extortion payment of \$1 million from a computer software company under the threat of posting installation instructions for the company's product that would negate the need to purchase the product from the company. In 2000, a \$200,000 extortion payment was demanded from media mogul Michael Bloomberg, under the threat of public disclosure of security breaches in the company's financial transactions computer system, as verified by a copy of Bloomberg's corporate I.D. sent with the demand. In January 2003, a Vermont man was indicted for the attempted extortion of a local hotel, by offering that in exchange for \$50,000 he would not divulge information to the local press concerning the illegal disposal of asbestos and lead paint on the hotel property (the focus of a local criminal investigation). A serial extortionist threatened a number of banks and retail stores in western Pennsylvania in 2000 by reporting the placement of an explosive device in their businesses which would be detonated if a cash payment was not made.

*Individual(s) on governmental agency.* These cases involve the extortion of governmental bodies, often concerning the threat of fraudulent litigation. Examples of such cases include: A Florida doctor and his real-estate adviser were convicted of the attempted extortion of Marion County by attempting to reach a cash payment in exchange for dropping a civil suit, a suit that was allegedly fraudulent in nature. In March 2003, police and rescue personnel (working with local "gangsters") blocked a rescue boat from delivering emergency supplies to a cyclone-stricken island until extortion payments were made

*Politician on individual.* These cases involve elected or appointed political officials who use their authority to extort monies or other items of value from individuals, often in return for assistance in obtaining contracts. Examples of these cases include: The mayor of Bridgeport, Connecticut, was convicted of 16 criminal counts including extortion for obtaining over \$500,000 of benefits (cash, expensive wines, designer clothing, and home improvements) from business associates in return for steering city contracts worth millions of dollars to them and their associates.

*Politician on corporation.* These cases involve elected or appointed political officials who use their authority to extort monies or other items of value from companies, often in return for assistance in obtaining municipal contracts. Examples of these

cases include: New York City Councilman Angel Rodriguez was indicted in 2002 for extorting a real-estate developer, promising to support an upcoming multi-million dollar waterfront development in exchange for \$50,000 cash and the sale of three pieces of real estate at below market price (three properties valued at \$1.5 million to be sold for \$1 million; the day after the contracts for these properties were signed, Rodriguez supported the development and the full council approved the project).

In October 2002, Wisconsin state Senate Majority leader Chuck Chvala was charged with 20 felonies, including extortion, in a 67-page criminal indictment that noted multiple allegations of extortive transaction; two \$500 campaign contributions were requested from a historical society lobbyist for a friendly vote, a \$7,500 contribution was required from the Wisconsin Realtors Association before a state senate vote on licensing home inspectors would be scheduled, a wholesale beer lobbyist was fired after refusing to pay a \$1,500 campaign contribution.

*Labor relations.* These cases specifically involve the operations of labor unions and often involve the following actions, usually accompanied by the threat of force or actual force: Demand of payoffs to union representatives in violations of labor laws to achieve certain concessions, solicitation of donations to remove pickets, and as noted in the August 2000 Federal Bureau of Investigation (FBI) and U.S. Labor Department's investigation into allegations that three United Auto Workers members extorted \$200,000 and jobs for relatives to end an 87-day strike at a General Motors plant after intentionally prolonging the strike to procure the money and job offers. Other extortion cases of this type involve sham fees which labor unions are not entitled to; extorting payments from employees for various services (already guaranteed under labor contracts such as health coverage); employer payments for labor consulting to establish bogus "sweetheart unions"; payments demanded for unwanted, excessive, and nonexistent workers; and extortive demands made upon nonunion companies to vacate the marketplace.

*Law enforcement personnel on individual.* These cases involve the extortion of individuals or criminal organizations by police officers who used their police powers either to grant specific favors or to use police resources to gain information. Actual cases include: A Washington, D.C., police lieu-

tenant was arrested for using police computers to ascertain the identities of patrons of the Follies Theater, a bar frequented by homosexuals, by running license plates of vehicles parked there and, after identifying married patrons, demanding money to not inform spouses or employers. In June 2003, three Canton, Mississippi police officers were arrested for offering to arrange for the dismissal of felony charges in exchange for \$6,000.

Local police in Federal Way, Washington, offered to “fix” a woman’s shoplifting arrest (\$34 from Wal-Mart) in exchange for sexual favors. In early 2003, the chief and three officers of the Camden, New Jersey, police department admitted to extorting “thousands” of dollars from persons involved in illegal activities (\$130,000 paid by one madam to prevent the arrests of prostitutes working for her, bars selling alcohol after hours, and allowing an amusement company with Cuban mob ties to place illegal video-gambling machines in bars and other businesses), and persons seeking to obtain or keep city contracts (towing companies were required to pay “fees” to police officers to get tow calls for vehicles disabled in accidents).

In February 2003, the former Donna, Texas, police chief was convicted of multiple criminal charges including extortion relating to demanding payments from drug smugglers to escort marijuana shipments through city limits. In 1996, six members of the nine-person Ford Heights, Illinois, police department were arrested on criminal charges, including extortion related to demanding payments for protection of drug sales territories, the sale of advance information on police raids, and “forcing” out other drug dealers who refused to pay.

*Organized crime operation on individual.* These cases involve money or objects of value from individuals in exchange for either prevention of certain acts or for the non-disclosure of specific information. Specific cases include: In August 2003, local “gangsters” threatened the safety of British soccer sensation Wayne Rooney if a percentage of his earnings was not relinquished to the crime group. Both law enforcement and sporting sources have acknowledged allegations of Russian Mafia extortion of one-third of the approximately 50 former-Soviet hockey players in the National Hockey League (NHL), with one player being extorted for six-figure payments to “protect” his family in Russia; the protection payment was needed after several acts of property damage occurred. In 2003, organized-

crime family members were found guilty of attempting to extort \$3 million from Hollywood action hero Steven Seagal, who originally refused to testify out of fear of retaliation, but was faced with contempt charges if he did not. Concerning the Seagal case, another organized-crime member was charged with threatening a *Los Angeles Times* reporter who broke the story originally; she was approached by a man with a gun who told her to “stop;” her car windshield was smashed, a dead fish with a long-stemmed rose was left on her car.

In 2002, members of the Indian mafia attempted to extort Bollywood (India’s version of Hollywood in Bombay) film star Hrithik Roshan, one of many attempts by the Indian underworld to extort actors, actresses, and producers. The Yakuza (Japanese organized crime operations) utilized extortion against owners of small properties to sell to developers so that large land deals could be arranged; in this practice (*jiage*) developers pay the Yakuza three percent of the land’s value (which due to inflated land values can often cause fees to be in the high six-figures).

*Organized-crime operation on corporation.* These cases involve organized-crime groups exerting pressures on companies to obtain something of value, often associated with the construction industry. Examples of these cases include: In 1998, three men with ties to the Gambino and Genovese crime families of New York were convicted of extortion by threatening labor unrest and economic injury to a contractor on the Newark Airport monorail project; the contractor was told to put men on the payroll even though they would not report to work (at one point one “ghost worker” was taken off the payroll and labor unrest occurred until the “worker” was reinstated and given back pay). In 2002, 27 members of organized-crime families were indicted for extorting payments (said to be approximately \$10,000 per night) from Long Island, New York, restaurants.

In 1996, 17 members of the Detroit, Michigan, organized-crime families were indicted for extorting payments from bookies and operators of illegal lotteries, persons who would be likely not to report the extortion attempts to local law enforcement. In February 2002, 26 bosses and members of New York organized-crime families were charged in a 137-count indictment including multiple counts of extortion; the indictment alleged that over \$6 million in wages and benefits were illegally obtained

over an 11-year period (with money being obtained from “no-show” workers. One fictitious worker, Mattlynn, received more than 1,400 checks totaling more than \$1.5 million. Contractors who did not hire members of a certain local were threatened with labor unrest if members were not hired and paid a premium rate.

In May 2002, 14 members of the Laborers’ International Union of North America Local 91 were arrested for extortive tactics against area contractors, workers, and developers, including beatings, assaults, bombings, and a \$100,000 vandalism incident (one taped conversation included threats of rape against family members, specifically juveniles). In October 2002, two officers of Local 81 of the International Longshoreman’s Association were arrested for threatening to kill the owner of a Rhode Island scrap-metal company, an elected state representative was present at the meeting where the threat was issued and recorded, but he was not charged.

The Yakuza in Japan committed various extortion operations, with some taking advantage of Japanese law which gives building occupants tremendous rights. *Senyu-ya* (occupation specialists) Yakuza members will illegally occupy a building before its upcoming sale for one of two purposes: to extort payment from the owner to vacate the property to allow the sale to proceed, and extort protection payments until the sales is finalized. If the owner does not pay, they stay in the building causing the price to plummet.

Additionally, the Yakuza take advantage of some Japanese companies’ desires to avoid confrontation and bad public relations by committing *sokaiya*, corporate extortion, by threatening to appear at board meetings to disrupt business. The extortion is halted either by cash or stock payments. Yakuza operations also use extortion in their debt-cutting/loan-collecting services (*songiri-ya*) in which loan payments are “recovered” by the Yakuza, charging their client 3 percent for “collecting” the debt and, the person collected from a 5 percent fee for getting the debt holder to accept a smaller amount on the loan (threat of force or force is often utilized against one or both parties);

*Ethnic extortion operations.* These are a subclassification of organized-crime extortion but identified by the ethnic specificity of both parties. Due either to a fear of law enforcement in general or a belief that local law enforcement would not be able to re-

solve the situation, members of some ethnic groups do not report these extortion attempts to the police. Cases of this type would include: Smugglers of illegal aliens across the U.S.-Mexico border who demand additional payments from their customers after they cross the border—detaining the undocumented aliens until their family members send more funds.

Asian street gangs often require local (Asian) businesses to pay protection money to the gangs to prevent acts of violence and, as noted in New York City’s Chinatown, they have made businesses install gang-owned blackjack and video-poker machines in their operations (similar activities have been noted by Chinese Tong, Vietnamese, Korean, and Russian gangs). A Dominican street gang, C&C, in the Bronx, New York City, demanded money from any group wishing to conduct illegal-drug sales in the Mott Haven section (mostly occupied by immigrants from the Dominican Republic), and anyone who refused to make payments was robbed, beaten, and sometimes murdered.

Indian crime gangs extort *hafta* payments, from Indian business owners (jewelry stores, restaurants, fast-food operations.) with the amount of *hafta* being a set payment according to the profit made by the business, with refusal to pay usually resulting in personal injuries. An Israeli organized crime operation in Los Angeles, California extorted protection money from elderly Jewish business-owners in the predominantly Jewish community of Fairfax and, in some cases, extorted partial ownership in businesses to run “bust-out” (order large sums of merchandise and then declare bankruptcy) schemes. In March 2003, members of the Philadelphia KGB, a gang of Russian émigrés, were charged with extortion, specifically using a soldering iron on at least one victim.

As evidenced by all these examples, extortion is rampant in the worlds of white-collar, corporate, and organized crime, often crossing into violent street crime.

## Exxon Valdez

THE CRASH of the Exxon Valdez in the waters off the coast of Alaska represents the worst oil spill in U.S. history, to date in the spring of 2004. On March 24, 1989, the Valdez tanker collided with Bligh Reef in the Valdez Narrows and spilled over 11 million gallons of crude oil into the waters of Prince William Sound.

Scheduled for a five-day trip from Valdez, Alaska, to Long Beach, California, the tanker was loaded with 1,264,164 barrels of North Slope crude. Just hours before the departure of the Exxon Valdez, its captain Joseph Hazelwood had been drinking a round or two of vodka. This factor was attributed as the primary cause of the accident. During the voyage, Hazelwood's speech was slurred while in radio contact with Coast Guard officials and, at one point, he mistakenly identified his vessel as the Exxon Baton Rouge. In addition, he made several questionable judgments regarding the course of the tanker.

Due to concerns over icebergs in the sound, Hazelwood had to make a decision regarding the direction of the Valdez. Instead of slowing down and waiting for the ice to move or have the ship work slowly through the ice, Hazelwood choose to turn the tanker and enter a gap between the ice and the Bligh Reef. The gap in this area was only one-tenth of a mile wide, almost the width of the tanker itself. This meant there was little room for error. Hazelwood also ordered that the tanker's speed be increased and the ship be placed on automatic pilot. Both commands were highly unusual. Normally, ships reduce their speed when they encounter ice in

order to minimize impact and allow for adjustments. Furthermore, the use of the automatic pilot was rare under such conditions because of the need to make changes in the ship's course. Another questionable decision by Hazelwood was leaving only one officer in charge of maneuvering the Exxon Valdez through the gap.

This lone officer was not given clear instructions regarding a course to follow nor an exact chart of the tanker's position. Shortly after Hazelwood left the officer alone, the Exxon Valdez ran aground on Bligh Reef and began leaking tremendous amounts of oil. For 15 minutes, Hazelwood attempted to force the tanker ahead but eventually the smell of oil in the air and control room gauges, that confirmed significant losses of oil, forced the crew to stop and wait for Coast Guard assistance. While the cause of the crash and spill was attributable to the officer being unable to properly maneuver the tanker, other factors played a major role. First, several of Hazelwood's decisions and judgments were highly questionable due in part to his impaired or intoxicated state. Second, the Exxon company reduced the Valdez crew, meaning that many of the members were excessively overworked and fatigued. Finally, Exxon did not have a proper recovery plan in place that could effectively deal with such a disaster.

The effects of the oil spill were tremendous on the surrounding communities. The loss of marine life, wildlife, and natural resources was abundant. The disaster happened at a time when fish and other marine organisms were beginning their reproductive cycles, and the large amounts of oil devastated the development and threatened the existence of many aquatic species and mammals. Over 200,000 seabirds were lost as well as thousands of sea otters and hundreds of other wildlife, including deer and eagles.

The economy of the surrounding communities was also significantly affected. For many families, the multimillion-dollar commercial fishery industry was dramatically altered or completely destroyed. In 1989, one of the primary economic resources, salmon fishing, was completely closed. While Exxon agreed to help with the recovery process, it remained slow. Some 15 years later, several of the animals and species in Prince William Sound had not fully recovered. Some shellfish remained contaminated and unsuitable for human consumption. The herring population collapsed in

1993 and had not recovered 10 years later. In 1992 and 1993, pink salmon runs failed and in 1994 they were severely depressed. In some instances, animals have almost left the region completely. Certain species of seals, sea otters, ducks, and killer whales can no longer be found in the region's waters. The majority of the animals and species, however, have very gradually recovered, yet millions of gallons of oil still exist in the mud and sand surrounding the Prince William Sound area.

In the aftermath of the disaster, Exxon paid billions of dollars in criminal and civil fines. The company paid \$900 million to the Exxon Valdez Trustee Council in 1991 to oversee the restoration of ecosystems damaged by the spill. This civil suit was filed under the Clean Water Act and the Comprehensive Environmental Response, Compensation, and Liability Act and the money awarded represented the largest recovery in U.S. history.

Also in 1991, Exxon pled guilty to a criminal charge and paid a \$100 million fine. In 1994, a federal court ordered Exxon to pay \$5 billion in punitive damages to help Alaskans harmed by the oil spills. The court stated that Exxon acted recklessly by allowing Hazelwood to command the Valdez tanker. Hazelwood was fired by Exxon and lost his

license to captain a ship. In addition, he faced criminal charges for leaving command of the ship to an uncertified officer and was convicted of negligent discharge of oil. He was sentenced to serve 200 hours per year of community service until 2004.

## Fair Housing Act

CONTAINED WITHIN the Civil Rights Act of 1968, the Fair Housing Act (Title VIII) bans potential discrimination in the real estate market. Most housing types are covered by the Fair Housing Act, except for certain exemptions by the act, which include buildings occupied by the owner with fewer than four units, single-family homes rented or sold without the assistance of a realtor, and housing administered or operated by private clubs. Enforcement of the Fair Housing Act is the responsibility of the U.S. Department of Housing and Urban Development (HUD).

The Fair Housing Act bans a number of discriminatory real estate actions based on race, national origin, religion, sex, familial status, or disabilities. No one may refuse to rent or sell housing, refuse to negotiate, take property off the market, deny the availability of a property, establish different guideline or fees for the sale or rental, provide different services or facilities, force owners to sell or rent, or deny listing of a sale or rental based on discriminatory criteria. When dealing with mortgages, no one may deny a mortgage loan, refuse to provide loan details, set different mortgage terms, or appraise a property differently. Lastly, the Fair Housing Act prohibits one from threatening or intimidating a person who is exercising his or her

fair housing rights, or from advertising or making statements which portray a preference in a real estate transaction based on discriminatory criteria.

If someone has a disability, she receives additional protection of her fair housing rights. A landlord may not refuse any reasonable modifications to the property if it allows a potential resident to use the housing, and landlords must make reasonable changes to housing policies or practices which make

*The Fair Housing Act regulated against discrimination based on family status or disability, among other criteria.*

it more accessible to residents with disabilities. For example, an apartment complex with a policy that bans pets must allow a blind resident to have a seeing-eye dog.

The Fair Housing Act established a timeframe which set requirements for housing complexes constructed after March 13, 1991. In all buildings with an elevator and more than four units, public areas must be accessible by disabled individuals, halls and doors must be suitable for wheelchair use, and all units must have accessible entrances, light switches, electrical outlets, and thermostats. Also, bathroom walls must be reinforced to allow for the potential installation of assistance bars.

Familial status is a major discriminatory criterion which is targeted by the Fair Housing Act. Unless a residential complex or community is qualified and registered for senior citizens only, owners or realtors may not discriminate against families with one or more children under the age of 18. In order for a facility to become registered as elderly housing, the property must only be occupied by people who are 62 or older or 80 percent of the residents are 55 or over, and the elderly status may be reviewed by the HUD secretary.

If a person is aware of the rights guaranteed by the Fair Housing Act and believes that they have been violated, complaints may be filed with HUD by letter or by telephone. After providing the necessary contact information and an account of the alleged discrimination, HUD will request a response from the alleged violator. After receiving the response, the claim may or may not be investigated further. Meanwhile, HUD will attempt to reach a conciliation agreement between the two parties which ameliorates the situation to the satisfaction on those involved.

If HUD believes that a person's rights have been violated and a conciliatory agreement cannot be reached, the person who submitted the claim and the violator will receive notification of an administrative hearing at no cost, which may be turned over to the federal court system if either party requests it. Potential outcomes of a hearing or a trial, where someone is found to be in violation, include compensation for damages, which takes humiliation and suffering into account or a ruling which requires that the housing be available.

Civil penalties payable to the federal government of up to \$10,000 for the first violation and \$50,000 for the third violation in seven years may

also be assessed, as well as payment of the attorney's fees.

## False Claims Act

BACKED BY PRESIDENT Abraham Lincoln, the False Claims Act (FCA) was enacted in 1863 and amended by Congress in 1986 to increase its implementation. The act is designed to deter fraud against the federal government by authorizing private citizens, known as *qui tam* relators, to file charges against any party attempting to collect payment from the government through fraudulent claims. The FCA covers a wide array of issues and requires only that a perpetrator did or would cause financial loss to the United States by "knowingly" committing fraud, whether through deliberate ignorance, disregard for proper practices, or outright falsification of claims. Examples of lawsuits filed under the FCA include: defense contractor overcharges, misrepresentation of Medicare healthcare services, and misuse of federal grant money from organizations such as the National Institutes of Health.

In addition to making fraudulent claims against the government punishable by both civil and criminal penalties, the FCA makes filing an anti-fraud lawsuit a potentially lucrative endeavor for any individual with direct knowledge of alleged fraud against the United States. The total recovery from each liable defendant is a fine of \$5,000 to \$10,000 for every violation plus three times compensatory damages on all overcharges.

On top of whistle-blower protection and relief, the *qui tam* relator is guaranteed up to 25 percent of the settlement in cases where the government inter-

venes and 25 to 30 percent in all other cases. From 1986 through 1996, FCA recoveries amounted to over \$1.13 billion, with private relators receiving over \$200 million in rewards. Around 1996, the emphasis in claims switched from defense contracting to healthcare fraud. This shift in focus resulted in a peak of 535 lawsuits filed in 1997 and monetary recoveries reaching \$1.2 billion for 2001.

By 2004, the trend in FCA claims shifted once again. The growing complexity of healthcare related cases has led to a decline in healthcare fraud lawsuits, but has opened the door to a new area of claims: research institutions. Under the terms of the FCA, research institutions can be held accountable for the actions of individual employees when these actions involve improprieties in the grant-reimbursement process, scientific misconduct, and failure to comply with rules regarding human research subjects. With settlements such as the \$32 million paid by the University of Minnesota for misappropriation and misrepresentation of grant money, it is likely that FCA cases in this area will continue to escalate.

Unfortunately, several problems emerged with the increased incentives for private *qui tam* relators to file FCA suits. For one, the FCA reward provisions virtually encourage relators to allow misbilling practices to grow to considerable dollar amounts before filing an FCA claim. Furthermore, the positive encouragement given to voluntary corporate audit and compliance programs in recent years is offset by the risk associated with generating information and reports that could fall into the hands of a money-hungry relator.

Finally, despite FCA protection, a reputation as a whistleblower is likely to permanently impair an individual's career prospects in a particular industry.

## fear of crime

MANY STUDIES CONCLUSIVELY demonstrate that, for Americans, fear of crime is worse than crime itself. A person's risk of becoming a victim of serious street crime in the United States is relatively low. For example, only about 8percent of Americans were victimized in 2002, mostly by property crimes, and only 0.006 percent of Americans were murdered. Yet, according to several studies, more than half of Americans report being concerned with or afraid of crime.

Fear can be understood as an emotion, a feeling of impending harm to one's well-being. A dictionary definition of fear would include an unpleasant and strong emotion caused by anticipation or awareness of danger, anxious concern, and anxiety or loss of courage caused by environmental circumstances. Fear of crime can be understood as being afraid, anxious, or concerned about becoming the victim of a criminal act, whether the risk of actually becoming a victim is real or imagined. Fear of crime is distinguishable from perception of crime risk. Whereas the former refers to an emotional state, the latter refers to more rational, evaluative judgment; an assessment of the likelihood that harm to a person's well-being from a criminal act will actually occur based on the presence or absence of certain environmental conditions.

#### MEASUREMENT AND FINDINGS

Fear of crime is typically measured through telephone surveys and written questionnaires. Subjects are asked about how safe they feel at home when alone, whether they feel safe when walking in their neighborhoods or on local streets, and how afraid they are of particular crimes.

According to hundreds of studies, fear of crime often emanates from actual criminal victimization, particularly when the victimization is perceived by the victim as serious. Victims of crime often report

higher levels of fear than non-victims. Studies show that being afraid of any physical harm predicts fear of crime, and that being afraid of certain types of crimes such as random violence, gun violence, and gang violence, predict fear of crime reasonably well.

Fear of crime also arises from exposure to accounts of crime in the media, which is not surprising given that most media crime reports focus on violent, random, and even bizarre crimes. Fear of crime also can stem from hearing about victimizations of friends and family members; this is created by what is called "vicarious victimization." Finally, fear of crime can also be preceded by a perception of crime risk, that is, a person perceives she will actually be a victim of crime and thus becomes afraid, but the emotional state of fear does not require a rational, evaluative judgment that crime victimization will actually occur. For example, a person may become afraid of being a victim of a mugging while walking on an isolated and dark stretch of desert road, even though being alone means a person cannot become a crime victim.

Fear of crime is generally higher among women than men, and among the elderly than among the young. This holds true even though the relative risk of criminal victimization for women and older people is less than that for men and younger people. Fear of crime is also thought to be higher in people who earn low incomes, who attain low educational achievement, and in people who consider themselves to be relatively powerless.

#### ALONE AND AFRAID

Fear of crime has also been found to be higher in people who report low levels of friendship networks, people who live alone, and people who believe they make particularly suitable targets for victimization. Fear of crime is found to increase in environmental conditions that are thought to be conducive to criminality (for example, dangerous or dark, isolated places) and in run-down areas where incivilities and social disorganization are higher. It has also been related to attributing evil intent to others (for example, based on racial stereotypes). People who fear strangers and minorities are more likely to fear crime.

People with less active lifestyles and people who watch large amounts of television are generally thought to be more afraid of crime, as well. Public opinion polls show that public concern over crime

peaks after coverage of major criminal acts. For example, concern over violent street crime peaked in 1994 after coverage of random violence and rioting in Los Angeles, California.

Public concern over terrorism increased in 2002 and 2003 along with the coverage of attacks against the United States and the War on Terrorism. That random violence in the 1994 riots and terrorism on American soil after 2001 were rare was not relevant for the levels of fear. Fear of crime is also thought to be higher among American citizens than citizens of other countries, even though generally U.S. citizens suffer no more criminal victimization than they do.

Virtually all studies of fear of crime focus on fear of certain types of street crime. Rarely has fear of white-collar and corporate crime been examined. Many studies have found that most Americans, even students of criminology and criminal justice, are relatively unaware of their risk of victimization from white-collar and corporate criminality. When people are unaware of such crimes, there is no reason to expect that these acts will be feared, even though the physical and financial harms caused by such acts dwarf the harms caused by all street crimes combined.

## Federal Deposit Insurance Corporation

THE FEDERAL DEPOSIT Insurance Corporation (FDIC) is an independent agency of the federal government created in 1933 to provide insurance protection for depositors in the event of bank failure. Since 1933, the FDIC has responded to thousands of bank failures, and its insurance protection has been expanded to include accounts in savings and loan associations. All insured depositors of failed banks and thrifts have been protected up to \$100,000 by the FDIC. The FDIC is also the federal bank regulator responsible for supervising certain savings banks and state-chartered banks that are not members of the Federal Reserve System.

As a regulator, the FDIC strives to prevent bank failures by monitoring the industry's performance and enforcing regulations intended to make sure financial institutions operate in a safe and sound manner. Banking, however, is a competitive business. Banks fail, and when they do, the FDIC uses money from the two insurance funds, the Bank Insurance Fund (BIF) and Savings Insurance Fund (SAIF) to promptly reimburse insured depositors. Banks and thrifts must pay the FDIC money four times a year to keep being insured. This money is collected and deposited into the BIF and SAIF. The amount of money each bank pays depends on how much the bank has in deposits and also how much money is already in BIF and SAIF.

To be insured by the FDIC, a bank must prove it is being run profitably and fairly. The FDIC visits banks on a regular basis, at least once per year, to make sure they are following the regulations. During the on-site visit, the FDIC employee, often called an examiner, can delve into the files to assess the quality of particular loans or to look for evidence of fraud or insider abuse.

FDIC examiners often uncover occurrences of insider fraud. Insider fraud has accounted for over one-half of all bank fraud and embezzlement cases closed by the FBI during the past several years. Insiders are in a position of trust and can abuse that trust for their own personal benefit. Insider abuses include failure to disclose their financial or personal interest in a business borrowing from the bank; diverting assets and income for their own use; misuse of position by approving questionable transactions for relatives, friends or business associates; abuse of

expense accounts; acceptance of bribes and gratuities; and other questionable dealings related to their positions at the institutions.

The FDIC and other federal banking regulators can correct and punish unsafe and unsound, or illegal practices and seek to rehabilitate troubled banks. The FDIC has a wide variety of enforcement powers, ranging from the informal written agreement to the more formal powers, such as the cease-and-desist order. The FDIC has the ultimate enforcement authority over banks and thrifts in the power to terminate insurance, as well as close an insolvent bank, one that lacks the money to pay depositors.

## federal gambling regulation

GAMBLING, in one form or another, has been around since the dawn of mankind. Gambling is an agreement between two or more individuals; it involves a game of chance where the winner becomes the owner of the loser's property. The U.S. government derives its power to enforce gambling regulations by Article 1 of the U.S. Constitution. The Commerce Clause grants "Congress the power to regulate commerce with foreign nations and among the several states."

This broad power has been used by Congress to abolish slavery, combat racketeering and organized crime, and desegregate the South. The U.S. Supreme Court has typically upheld these landmark decisions. In the early American Colonies, gambling was seen as an evil sin. This is understandable since many of the colonists were strict religion-

ists with strong social codes against sin and vice. There have been numerous valleys and peaks in the tolerance of gambling in the United States. Andrew Jackson believed betting was a sin.

After the Civil War, especially in the American West, gambling gained popularity. However by the 1890s, gambling was outlawed in most areas of the United States. Nevada legalized casino gambling in 1931. This monopoly on gambling stayed in place until New Hampshire introduced its state lottery in 1963. Since then, a majority of states have instituted some form of gaming as a rich supplement to state income.

In the United States gambling has been regulated by each individual state. Some states such as Alabama do not allow any type of gambling at all, while other states such as Nevada, New Jersey, and Mississippi permit it in a variety of forms. In the late 1970s and early 1980s, several Native American tribes wanted to open gambling establishments on their tribal lands, as tribal elders searched for ways to relieve the desperate, ongoing poverty of their tribes.

While the tribes stated sovereignty in the affairs that dealt with their land and people, Congress did not agree. In 1988, Congress passed the Indian Gaming Regulatory Act. This act states that tribes may participate in ritual gaming, card games, and bingo with the guidance of the National Indian Gaming Commission. Tribes may open and operate casinos if they have an agreement with the state in which their land is located. Gambling laws in America are enacted and enforced in the classic Federalist style.

The federal government tends to take the *laissez-faire* (hands off) approach to these matters, and allows states to enact laws they deem necessary and only intervenes when needed or asked to by the states.

## Federal Trade Commission

THE FEDERAL Trade Commission (FTC) was enacted under the Federal Trade Commission Act of 1914, and was created in 1915. The FTC provides regulatory enforcement of rules and regulations designed to maintain fair and open competition in the marketplace. While the banking and transportation industries are regulated by other agencies, the FTC is responsible for enforcing rules and regulations for many other industry groups, including those that may be related to banking and transportation.

In addition to enforcement of the FTC Act, the FTC is responsible for enforcing laws created by other acts, such as the Wheeler-Lea Act of 1938 and the Robinson-Patman Act of 1936. The FTC does not possess criminal law enforcement powers, but does have civil and regulatory authorities that are enforceable through the federal court system. Among the actions available to the FTC are consent decrees between the commission and businesses. Consent decrees are agreements between the parties in which the offending business does not admit fault, but agrees to never engage in the behavior.

The FTC can also issue cease-and-desist orders, ordering businesses to change trade practices under the possibility of penalties for failure to comply. The FTC can also make a criminal referral to the U.S. Department of Justice in those instances in which a business fails to comply with a cease and desist order or refuses to enter into a consent agreement, or in which the FTC finds that the case is so severe that criminal action is warranted.

The FTC is divided into several bureaus, each of which is responsible for various activities within the commission. The Bureau of Consumer Protection comprises six divisions. The Advertising Practices Division deals with truth-in-advertising practices such as deceptive or unfair advertising. Such violations may include advertising a product at a certain price, while refusing to honor that price at the store. The Enforcement Division civilly prosecutes such cases and enforces other consumer protection laws.

The Financial Practices Division develops policies and enforces laws concerning the Truth-in-Lending Act, which requires lenders to follow certain rules and guidelines in issuing credit. For example, the FTC might get involved in cases where lending institutions automatically force minority borrowers to borrow money at subprime rates regardless of their credit history. Subprime rates are

given to borrowers at higher interest rates than are available to other borrowers.

The Marketing Practices Division enforces consumer protection laws dealing with such issues as deceptive telemarketers, pyramid schemes, and internet scams. The Planning and Information Division assists consumers in getting information they need, as well as assisting FTC attorneys and other law enforcement agencies in protecting consumers' rights. The Consumer and Business Education Program develops advertising and education program to educate consumers and businesses about their respective rights.

#### LAW ENFORCEMENT

The Bureau of Competition enforces antitrust laws and deals with the enforcement of merger and acquisitions, nonmerger enforcement, and research and policy studies. The FTC Act, along with the Sherman Antitrust Act of 1890, the Clayton Antitrust Act of 1914, and other acts, mandates the FTC and other agencies to maintain a competitive marketplace free of monopolies and other trade restraints.

There are two basic types of mergers. Horizontal mergers occur when a business purchases a competitor, thus reducing the number of competitors in the marketplace, and possibly resulting in an unlawful monopoly. Vertical mergers occur when a business purchases a collateral business such as a supplier or store that sells its products. Nonmerger enforcement deals with such anticompetitive acts as price fixing, boycotts, and illegal ethics codes. Research and Policy Studies is a part of the Bureau of Competition and produces reports for Congress concerning issues of consumer protection that are important to the public, and analyzes policy proposals for the FTC.

The Bureau of Economics help the FTC evaluate the possible influence of its enforcement actions on individuals, businesses, and the marketplace. The bureau also analyzes the market and its operation and produces studies of legislative actions and regulations.

## Federal Trade Commission Act

THE FEDERAL Trade Commission Act of 1914 (FTCA) was passed to create the Federal Trade Commission (FTC), and to give the U.S. government a full salvo of ammunition to use against anti-competitive market behavior, as well as other forms of unlawful behaviors in the marketplace. Specifically, the FTCA provided for regulatory enforcement against individuals, corporations, and organizations that violated the Sherman Antitrust act of 1890, and the Clayton Antitrust Act of 1914.

In addition, the FTCA barred the use of deceptive or false advertising by individual, corporations, and organizations. Deceptive advertising occurs when an individual, corporation, or organization knowingly advertises a product or service, which does not exist, or is not what is truly advertised. One type of deceptive advertising is known as bait-and-switch advertising. In bait-and-switch advertising, an advertiser markets a product to draw a customer to their establishment, at which time a salesperson will either tell the consumer that the advertised product is not available, or that there is a better quality product available at a higher price. The FTCA allowed for bringing a regulatory action against any individual, corporation, or organization involved in interstate commerce with the exception of banking institutions, the transportation industry, and agricultural cooperatives.

The FTCA requires a lesser standard of proof than do the Sherman and Clayton Acts. Under the FTCA, the standard of proof is whether "the acts of practice causes or is likely to substantial injury to consumers which is not reasonably avoidable by consumers themselves ..." The Sherman Antitrust Act of 1890 provided for criminal penalties for interstate violations of laws pertaining to business monopolies and other market restraints, which re-

quire a beyond reasonable doubt standard of proof. Likewise, the Clayton Antitrust Act of 1914 allowed for civil action against individuals, corporations, and organizations involved in anticompetitive behavior, requiring a preponderance of the evidence standard of proof. The FTCA was meant to give extra enforcement power to the government without the long tedious process of bringing a case to trial in either a criminal case or civil action, nor requiring the stricter burdens of proof to protect consumers.

Unlike the Sherman and Clayton Acts, the FTCA allowed accused parties to enter into a consent agreement with the FTC in which the party would not admit guilt, but would agree never to engage in the behavior in the future. The FTCA also gave the FTC the power to issue cease-and-desist orders, which would be enforceable by petition to the U.S. Circuit Court of Appeals. Failure by a defendant party to act in accordance with the consent decree or cease-and-desist order can result in the party being found in contempt and subject to other actions, including criminal referral to the U.S. Department of Justice (DOJ).

Additionally, the FTC may under some circumstances either make a criminal referral to the DOJ without first engaging in a regulatory action, or engage in a civil suit against the defendant party. This may occur if the FTC believes that the behavior is so grievous as to warrant regulatory action, or if the defendant party chooses to not cooperate with the FTC.

## felony

GENERALLY, THE DESIGNATION of an offense as a felony or misdemeanor is determined by the

punishment prescribed. Thus, a felony is defined as an offense for which an offender, upon conviction, may be punished by death or by imprisonment for more than one year, and an offense is a felony so long as the statutory maximum punishment is for more than, that is, in excess of one year. Felony has been said to be crime of a graver or more atrocious nature than those crimes designated as misdemeanors.

What may be a felony in one jurisdiction may be a misdemeanor in another, and vice versa, and in some jurisdictions crimes may not be classified at all. The very concept of felony seems to have been introduced into England by the Normans. The term originally referred to a breach of faith between man and lord. The Norman word for such a breach of faith was *felony*. In England after the Norman Conquest, the most serious crimes came to be called felonies because they were considered to be breaches of the fealty owed by all people to the king as guardian of the peace of the realm. In common law, a felony was an offense punishable by forfeiture of land and goods to the crown. Thus, the term became applicable to certain specified crimes, including murder, rape, robbery, and others, which still are referred to as common-law felonies.

An appeal of felony was an ancient form of a lawsuit brought by a victim, or the heir or widow of a slain victim, against a wrongdoer to prove the commission of a felony. Appeals in the sense of suits by victims seeking punishment for their wrongdoers came before the king's court when victims formally alleged that wrongdoers acted feloniously and against the king's peace. Victims could bring appeals for any of the traditional common-law felonies, including homicide, rape, mayhem (maiming), robbery, burglary, larceny, and arson. The consequences of conviction were drastic. The usual sentence for felons after 1200 was death by hanging. The king received the value of any goods, chattels, and short-term interests in land possessed by a felon after the commission of the felony.

A mark of the ancient origin and drastic consequences of the appeal was the use of trial by battle to decide the truth or falsehood of the accusation. By 1250, defendants in most appeals could choose to defend themselves either "by my body" (waging battle with the plaintiff in a duel) or "by the country" (putting the question of a person's guilt or innocence to an inquest, a jury of 12 lawful men from the place where the alleged wrong occurred.

All litigants who lost their cases before the king's courts in this period had to pay an immurement, a small monetary penalty, for asserting their unsuccessful claims or defenses. Unsuccessful plaintiffs in appeals of felony were in much more serious trouble. *The Bracton Treatise*, written in the mid-13th century, stated that in earlier times, a false accuser suffered the same death penalty the falsely accused defendant would have suffered. In the 13th century and afterward, unsuccessful plaintiffs in appeals, including those who had admitted defeat in battle, could be sent immediately to prison until they obtained a pardon or paid a large fine to the king.

Indictment of felony was an alternative to appeal of felony, a newer method (new in the late 1200s) of starting a prosecution. The sheriff, as a king's representative, would pick 12 jurors in each locality who would swear to make presentment of all persons suspected of committing felonies or trespasses there. A presentment of felony, written up as an indictment, would put the suspected wrongdoer on trial at the king's suit, not at the suit of any individual victim.

Gradually, over the course of the 13th through 16th centuries, indictments of felony replaced victim's appeals of felony. Victims who feared trials by battle or the risk of fine or imprisonment associated with appeals of felony could seek vengeance indirectly by telling the facts to a sheriff, coroner, constable, or justice of peace. These officials were duty-bound to bring information from any source about felonies and trespasses to the jury of presentment, ancestor of our grand jury. Victims had no control over prosecutions by indictment, but they could expect that wrongdoers convicted on indictments of felony would suffer the same punishment as those convicted on appeals: death, confiscation of goods, and forfeiture of land. Confiscation of felons' goods and a year's rent from their lands were valuable rights for the crown.

In addition, by 1400, convicted felons often paid large sums to purchase pardons from the king and thereby save their lives and recover their lands. The king's interest in punishing felonies and other wrongs was more than just a financial motive. The king punished felons because every subject wanted or should want them punished; the king's peace was their peace. A felon to the king was a felon to the whole kingdom. Robbery and fighting offended the whole community, not just the individual victim.

Thus, comes the notion that a crime is against the state (society), not just the individual victim. The appeal of felony as an individual lawsuit gave way to the indictment of felony, pursued by the king (state). This is the immediate predecessor of our current notion that a crime is against the state, and the state undertakes the prosecution and punishment.

## fertility fraud

**CRIMES IN REPRODUCTIVE** medicine that entail embezzlement from sperm banks or the theft of human eggs and embryos—once imagined only in science-fiction or mystery novels—have become a disturbing reality. Rumors of "egg-snatching" have been intimated since the development of the in vitro fertilization (IVF) procedure.

Robert Edwards, who in 1978 was responsible for the first successful "test-tube" baby, allegedly used eggs without the consent of donors. The field of reproductive medicine has become replete with accusations of malpractice and insurance fraud, due in part, to unprecedented technological and fiscal

*Fraud or negligence can occur at any stage of the in vitro fertilization process, including in laboratory procedures.*

*Many infants born as a result of fraudulent fertilization may never know their true genetic heritage.*

growth. The estimated \$2-billion-a-year industry has outpaced regulations and legislations. Procedures for infertile couples have come under legal and professional scrutiny as bizarre scenarios have emerged involving human sperm, eggs, and embryos.

Crimes involving the misuse of sperm and eggs have occurred throughout the world. A fertility doctor in Italy faced criminal charges after he impregnated women without their consent with strangers' sperm. Speculations also abound that the doctor may have created "hundreds or thousands" of half-siblings by using sperm from only two donors. Another fertility doctor admitted that during his medical residency at Georgetown University in Washington, D.C., he used his own sperm for donations that resulted in 33 pregnancies, despite professional mandates that limit sperm donations to 10 recipients. The "egg hunt" involved a group of doctors in Massachusetts that allegedly took hundreds of eggs from women receiving medical care without fully informed consent.

Cecil Jacobson, a noted Virginia physician and medical pioneer, received national attention after reports emerged that he used his own sperm to inseminate women—without their consent. The self-proclaimed "baby maker" also used hormone treatments to convince women that they were preg-

nant only to report a few weeks later that the fetus had died. Jacobson may have fathered as many as 70 children over the course of 12 years. In 1992, he was convicted of 52 felony counts of fraud and received a five-year prison sentence.

#### FRAUD WHISTLEBLOWERS

The most widespread fertility scandal became public in mid-1995 at the University of California, Irvine's medical center. The apparent misdeeds at the Center for Reproductive Health were reported by three whistleblowers, who suffered retaliation and were paid a sizable sum as part of a confidential settlement agreement with the university. In 1993, internal auditors, who were later demoted or fired, had reported problems with insurance billings and financial irregularities to university administrators.

Primary among the many accusations was that doctors Ricardo Asch, José Balmaceda, and Sergio Stone implanted stolen eggs and misused embryos in scientific research without the consent of the "owners." Asch and Balmaceda fled the United States to South America to avoid arrest after a federal indictment was issued charging them with fraud. Stone remained in the United States and faced charges of mail fraud and tax evasion. Stone, who had no involvement in the misuse of oocyte

(cells from which a fetus develops), was convicted of mail fraud but acquitted of the other charges. Over 100 former patients, who hoped to seek financial redress for their victimization, filed civil lawsuits against the doctors and the university. The patients accused the doctors of negligence, fraud, conspiracy, and racketeering for the sale, donation, and/or misappropriation of their eggs and embryos. The university ultimately settled the patient suits at a cost of more than \$20 million.

### WHITE-COLLAR ASPECTS

Social science investigations of medical fraud are commonly done within the framework of white-collar crime. Criminologists have researched a variety of criminal actions in the medical field, such as fee-splitting, insurance fraud, and unnecessary surgery. Researchers have learned that physicians who engage in fraud have avoided scrutiny because of prestige, autonomy, and power associated with their social status (indeed, fitting Edwin H. Sutherland's classic definition of white-collar crime). Doctors working in advanced reproductive technology may foster an air of impenetrability even beyond other physicians because of the intimate nature of what they do. The intricacies and rapid changes within this specialization may encourage deviance for the sake of scientific achievement, personal glory, or fiscal fortune (hence, the bioethical challenges of human cloning).

Fraud in reproductive medicine has ranged from false advertising to faked research results. Some experts claim that patients often are subjected to extensive testing that may be unnecessary, undergo treatments that have a low chance of success, or are treated beyond the optimum years for achieving a pregnancy. Given the fiercely competitive nature of the specialty, clinics may exaggerate successful pregnancy rates or lure patients with questionable money-back guarantees. Insurance fraud may involve using inappropriate billing codes that reflect a different type of procedure that is covered by the policy, or making claims for attending physicians who were not present during the surgery. Like other white-collar crimes, most violations in reproductive medicine are difficult to detect. Proving intent is problematic. Fraud in reproductive medicine is rarely legally defined, though a few states have adopted statutes safeguarding embryos. A smattering of court decisions have delved into

cases addressing the destruction of embryos and disputes over custody of embryos. A 1978 New York district court decision awarded \$50,000 for the intentional infliction of emotional distress when a doctor destroyed a couple's incubated "pre-embryo" without prior consent.

In *York v. Jones* (1989), the first case to deal with a dispute between an IVF program and a couple over custody of a frozen embryo, the court determined that the embryo was the property of the gamete providers. After the Irvine scandal, California enacted legislation that made the intentional transfer of eggs, sperm, or embryos without consent a felony punishable by a maximum of five-year prison term and fines up to \$50,000.

UNIVERSITY OF COLORADO, DENVER

## fiduciary fraud

FIDUCIARY FRAUD, a branch of white-collar crime that has witnessed rapid growth since the 1980s, involves a breach of trust committed by financial institutions such as banks and savings and loans, insurance companies, financial service companies, and pension funds. Embezzlement by lower-level employees, still the most popular form of fiduciary fraud, has been overshadowed by the misdeeds of upper-level staff who mismanage and loot their own companies.

A fiduciary, commonly a trustee, possesses powers that normally belong to another person. As such, the fiduciary bears a legal obligation to act primarily for the client's benefit in financial matters

and not for the fiduciary's own personal interest. Fiduciaries are duty-bound to always act in complete fairness and to not exert any influence or pressure, take selfish advantage, or deal with the client in such a way that it benefits the fiduciary or prejudices the client. Business shrewdness, hard bargaining, and taking advantage of the forgetfulness or negligence of the client are totally prohibited actions. Fiduciary responsibilities exist for persons other than trustees such as between solicitor and client and principal and agent.

The most publicized and most expensive type of fiduciary fraud involves savings and loan institutions. In the 1980s, savings and loan fraud cost \$200 billion in short-term losses to taxpayers with the eventual costs projected to be about \$500 billion as interest accumulates over the next few decades. The biggest bank failure in American history took place when California entrepreneur Charles Keating plundered the Lincoln Savings and Loan Association. Some financial experts have attributed bank fraud to owners pushed to the brink of insolvency by adverse market conditions. These owners then gamble by making risky investments that would theoretically produce a high rate of return. This view neglects to take into account the evidence that the worst thrift failures, such as the Lincoln case, can be traced to investments that were unsafe, illegal, and involved substantial fraud.

Insurance insolvencies have also increased dramatically since the early 1980s. While the public usually describes insurance fraud as beneficiary fraud perpetrated by customers who file false claims, this is not the type of fraud that causes the most damage to the public. Premium diversion is a type of fiduciary fraud whereby funds intended to cover claims are diverted for other purposes. The fraudsters, typically owners of small businesses, simply vanish after collecting premiums from customers. More sophisticated schemes rely on creating a network of service and affiliate companies that bill larger companies for ambiguous items such as "operating costs."

Some analysts point out the insurance industry is dangerously under-regulated. Insurers must demonstrate that they have sufficient assets to meet capitalization requirements to pay potential claims. But many can and do cheat by inventing phony assets, renting assets, or temporarily acquiring assets to place on the books for only a day to meet reporting standards. One Texas company claimed that it

owned \$20 million in real estate but the property had been condemned by San Antonio authorities and did not possess a market value anywhere near the claimed amount.

States monitor insurers operating within their jurisdiction and the states require that many insurers contribute to a guaranty fund that is supposed to pay claims filed against a failed company. In practice, it has been reported that many claimants in such circumstances receive no benefits. Moreover, increases in guaranty fund assessments resulting from claims are passed along to the consumer in the form of higher premiums.

Fiduciary fraud committed by investment and financial services commonly utilizes a Ponzi or pyramid scheme. Investors are promised spectacular returns but their money is used instead to finance illegal securities speculation and exorbitant personal spending. The funds delivered by later investors are diverted to pay interest to early investors thereby delaying discovery of fraudulent behavior. The firms conceal losses by sending out false account statements, audit confirmations, and other similar documents.

The largest pension scam in American history involved a Ponzi scheme run by First Pension Corporation of Irvine, California. The managers of the firm began to behave fraudulently only one year after the company was founded in 1982. Company founder William Cooper, company President Valerie Jensen, and Chief Financial Officer Robert Lindley pleaded guilty in 1994 to cheating 8,000 First Pension clients out of \$66.7 million in direct investments and \$54.8 million in lost interest. Funds were never invested but were instead utilized to pay dividends and interest on older investments until the scheme collapsed and First Pension declared bankruptcy.

Pension funds are loosely regulated in the United States and this lack of governmental supervision has led to a plethora of criminal activity. The 2002 case of Concord, New Hampshire-based International Paper Box Machine Company is typical. The owners of the firm allegedly took money from employee paychecks intended for deposit into their 401(k) accounts but never forwarded that money to Fidelity Investments, managers of the accounts. In the lawsuit, the U.S. Department of Labor also claimed that the firm's owners failed to make corporate contributions to the accounts. Failing to forward employee contributions to 401(k) fund

accounts is a direct violation of the Employment Retirement Income Security Act (ERISA).

Fiduciary fraud is a growing criminal area because of combination of human greed and the failure of governments to impose adequate controls. Federal oversights are woefully deficient and regulators often appear inept, as fraudsters have repeatedly explained after their convictions.

## Film Recovery Systems

ON JUNE 14, 1985, in what legal experts say is the first case of its kind, Judge Ronald Banks convicted Steven O'Neil, Charles Kirschbaum, and Daniel Rodriguez, agents of Film Recovery Systems, Inc., of murder in the death of Stefan Golab, an employee, from cyanide poisoning. Banks, who heard the case without a jury, said the evidence during the eight-week trial clearly showed Golab died from inhaling cyanide under "totally unsafe" workplace conditions.

Golab's death, according to the judge was no accident, but murder. Corporate defendants, Film Recovery Systems and its sister corporation Metallic Marketing Systems, were convicted of involuntary manslaughter in the death.

The now defunct Film Recovery was a company engaged in the business of extracting silver from used X-ray and photographic film for resale. The recovery process involved "chipping" the film and soaking the granulated pieces in large, open vats containing a solution of water and sodium cyanide. The cyanide solution caused silver contained in the film to be released. Cyanide is a very poisonous chemical. Exposure to high levels of cyanide harms

the brain and heart, and may induce coma and cause death, as it did to Golab.

On the morning of February 10, 1983, while at work, Golab became dizzy and fainted. He eventually lost consciousness and was taken outside of the plant. The paramedics were called but were unable to revive him. Golab was pronounced dead upon arrival at the hospital. The medical examiner determined that he died from acute cyanide poisoning through the inhalation of cyanide fumes in the plant air.

Prior to Golab's death, numerous workers had complained of headaches, nausea, and vomiting—which are major symptoms of cyanide poisoning. In response to the complaints, management told the employees to go out and get some fresh air and that they could find another job if they wished. The indictment stated that the individual defendants failed to disclose to Golab that he was working with substances containing cyanide. The indictment also stated that the defendants did not provide adequate equipment to protect him from attendant dangers involved with working with the highly dangerous chemical.

O'Neil, Kirschbaum, and Rodriguez, were convicted of murder and sentenced to 25 years in prison. The application of criminal homicide laws to an occupational death was reportedly the first of its kind in the United States. However, the landmark murder convictions were overturned on appeal. The decision was reversed and remanded by an Illinois appeals court because the murder convictions were legally inconsistent with the manslaughter convictions of two other corporate defendants in the case. The ruling set the stage for a new trial for the men, the first corporate officials prosecuted for a work-related employee death.

On September 7, 1993, just prior to their retrial, the three former employees entered guilty pleas of involuntary manslaughter for the 1983 cyanide poisoning death of Golab. After entering the pleas, O'Neil was sentenced to three years in prison, Kirschbaum to two years in prison, and Rodriguez to 30 months' probation, four months of home confinement and 500 hours of community service.

The decade-long prosecution of these three corporate officers set the precedent that employers have obligations in the creation of a safe work environment. This case showed that employers can and will be held criminally responsible for workplace

fatalities if they or the company are negligent or reckless with safety measures.

## Financial Accounting Standards Board

THE FINANCIAL Accounting Standards Board, which is often simply referred to as the FASB, is responsible for developing improved standards related to financial accounting and reporting. FASB is believed to be an important part of the accounting process because of the very nature of the economy and the stock market; this belief stems from the fact that many investors rely upon the financial statements issued from a company when determining which stocks to purchase, and an opinion from the FASB carries the weight of law.

Since 1973, the FASB has maintained the absolute authority to regulate standards for the accounting industry. While the Securities and Exchange Commission (SEC) has been granted statutory authority to make decisions concerning accounting standards, both the SEC and the American Institute of Certified Public Accountants (AICPA) have recognized FASB statements as authoritative in regards to accounting practices and policies.

While some consider the FASB to be a committee for establishing policies and procedures, the FASB is in actuality an independent structure consisting of a multi-divisional hierarchy. The first division is the Financial Accounting Standards Board,

which is the most recognized division and provides opinions on accounting standards. The Financial Accounting Standards Advisory Council (FASAC) is a lesser known division comprised of 30 members who consult with the FASB on technical issues, and the Financial Accounting Foundation (FAF) is the final division and is responsible for selecting the FASB members and ensuring that there are funds for the board to operate.

When the FASB is considering either a change or an addition to accounting standards the proceedings are open to the public and constituent views are openly accepted. In reaching a decision as to whether to consider an issue the FASB may consult with numerous other standard setting bodies such as the Accounting Standards Executive Committee (AcSEC) or the Auditing Standards Board of the AICPA. Once the FASB has completed consultation with these entities, several additional factors are then considered.

The pervasiveness of the issue is one of the first considerations and involves the FASB determining the extent to which the issue is currently impacting users. For example, the FASB may examine whether there are stark differences in how an issue is being handled and determine that the issue is of such importance that all users should be applying the accounting principle in a similar manner.

Additionally, the FASB will consider the impact a change may have on international accounting principles, and will occasionally consider whether there is support for a principle from one of the other national standard organizations. In reaching an agreement on proposed changes in standards, the FASB follows established principles. These principles are: to be objective in its decision-making, to weigh carefully the views of its constituents, to promulgate standards only when the expected benefits exceed the perceived costs, to bring about changes in ways that minimize disruption to the continuity of reporting practice and to review the effects of past decisions and interpret, amend or replace standards in a timely fashion.

## Financial Crime Kingpin Statute

IN RESPONSE to the late 1980s savings and loan scandal, where the largely unregulated savings and loan industry nearly collapsed after approving billions in insider loans for dubious projects, President George H.W. Bush signed the Crime Control Act of 1990. Title XXV of the Crime Control Act, the Comprehensive Thrift and Bank Fraud Prosecution and Taxpayer Recovery Act of 1990 (the Bank Fraud Act), criminalizes the concealment of assets from a bank conservator, obstruction of a bank examination, and administration of a continuing financial-crimes enterprise.

The last of these crimes creates a "Financial Crime Kingpin" statute. If convicted under the statute, individuals involved in a "continuing financial crime enterprise" who gross more than \$5 million over 2 years may be subject to imprisonment from 10 years to life, and fines up to \$1 million. Organizations found guilty under the statute may be fined up to \$20 million. The law also contains a "mini-kingpin" statute for a defendant who grosses more than \$1 million from a crime affecting a financial institution.

If convicted under the mini-kingpin statute, an individual may be subject to imprisonment for no less than 51–63 months. Any individuals convicted of criminal offenses involving dishonesty or breach of trust under the Financial Crime Kingpin Statute is barred from participating in the business affairs of a depository institution or savings and loan without approval of the Federal Deposit Insurance Corporation.

### FREEZING ASSETS

The act makes it easier for the FDIC and other federal law enforcement agencies to obtain a court order to freeze the assets of an officer or employee prior to a judgment by the courts. These provisions are strikingly similar to legislation passed to prevent drug kingpins and organized crime figures

from removing their illegally obtained assets from the reach of governmental authorities. The act also enhances the ability of a sentencing court to order a convicted defendant to make restitution to a victim directly harmed by the defendant's conduct. Finally, if an individual is found guilty under the law, the legislation bars a financial institution from compensating employees for expenses incurred in defense of actions brought by a regulatory agency.

Passage of the law bolstered federal supervision over the beleaguered savings and loan industry. To assure adequate monitoring of the new statute, Congress also approved additional funding for the Federal Bureau of Investigation, the offices of the U.S. Attorneys, the Criminal, Civil and Tax Divisions of the Department of Justice, the Internal Revenue Service, and the federal court system under the Bank Fraud Act. In addition to ushering in a new era of supervision of oversight for a number of banking and non-banking institutions, the new law set the framework for cooperative efforts among the various agencies working on criminal matters involving corporate, investment, and other financial institutions.

A decade later, the cooperative framework established by law enforcement agencies under the Financial Crime Kingpin statute would assist in investigations of securities markets, and accounting scandals related to the collapse of several major U.S. firms, such as Enron Corporation and WorldCom, which were linked to a series of illicit financial maneuvers that promoted public and Congressional calls for better oversight of financial institutions not covered under the Bank Fraud Act of 1990.

JOURNAL OF MONEY LAUNDERING CONTROL

## Firestone tires

IN THE LATE 1990s, a series of fatal repetitive accidents occurred among drivers of Ford vehicles using certain Firestone tires (manufactured by Bridgestone/Firestone, Inc., the result of a 1990 merger) that experienced tread separation. This led to major recalls of tires by Firestone, free tire replacements by Ford Motor Company, an extensive investigation by the Department of Transportation (DOT), hearings before the U.S. Congress, and hundreds of lawsuits.

As reports of accidents involving the Firestone ATX, ATX II, and Wilderness tires began to mount in mid-2000, the National Highway Traffic Safety Administration (NHTSA), a division of DOT, opened its investigation. Under the provisions established by the National Traffic and Motor Vehicle Safety Act of 1966, in August, Firestone was forced to recall all of its ATX and ATX II tires in the P235/75R18 ATX series at a cost of approximately \$3 billion. Over an 18-month period, Firestone recalled tires in all 50 states. Problems with Firestone tires on Ford Explorers were also experienced in 12 foreign countries.

On May 22, 2001, Ford offered free replacement of approximately 13 million Firestone Wilderness tires on Ford Explorers, Mercury Mountaineers, and Mazda Navajo sport-utility vehicles (SUVs) and Ford Ranger trucks. A week after Ford's announcement, arguing that the cause of the accidents stemmed from a faulty design of Ford Explorers rather than with the design of the Firestone tires, Firestone filled an official request asking that the National Highway Traffic Safety Administration (NHTSA) begin an investigation into why so many Explorers crashed, sometimes rolling over, after tread separation occurred in the Firestone ATX and Wilderness AT tires. Firestone supplemented their request with data compiled by their own vehicle dynamics consultant. After examining Firestone's data, the Office of Defects Investigation (ODI) concluded that there was insufficient evidence to warrant an investigation into the Ford Explorer.

In response to public concern over automobile safety, the Transportation Recall Enhancement, Accountability and Documentation Act, popularly known as the TREAD Act, which was intended to ensure automobile safety and which was specifically aimed at accountability of tire manufacturers, was

introduced in the House of Representatives on September 13, 2000. Acting with uncustomary promptness, both houses of Congress passed the bill and handed it to the president by November 1. The TREAD Act became P.L. 16-414 on November 1, 2000, giving NHTSA the authority to regulate tire performance standards, tire pressure warnings, early-warning reporting regulations, roll-over testing, and child restraint improvements. A harsher bill that did not pass would have imposed criminal penalties on automobile executives who did nothing about known defects in automobiles and automotive equipment.

On October 4, 2001, NHTSA announced its investigation into Firestone Tires, concluding that the P235/75R18 and P255/70R18 tires manufactured at the Decatur, Illinois, Firestone plant and sold by Ford Motor company before May 1998 were responsible for a number of reported crashes, injuries, and deaths due to tread separations that caused drivers to lose control of their vehicles, often resulting in roll-overs. ODI extended its investigation to include Firestone tires manufactured in Wilson, North Carolina, and Oklahoma City, Oklahoma, in the United States and in Joliette, Quebec, in Canada.

On June 19, 2001, Michael P. Jackson, the Deputy Secretary of Transportation, reported to a joint session of Congressional committees that the NHTSA investigation revealed 285 crashes and 123 fatalities had been reported among the users of the 14.4 million tires recalled by Firestone. Thirty-seven crashes and 10 fatalities were reported among users of the 13 million tires included in Ford's replacement program, and another 15 crashes and five fatalities were reported in response to NHTSA's consumer advisory of September 1, 2001. An estimated eight crashes and 12 fatalities were reported among users of 23 million other Firestone tires not included in the other reports.

In addition to government investigations, hundreds of class action lawsuits were filed against both Firestone and Ford Motors, beginning as early as 1991. The majority of them were settled out of court, and the lack of publicity allowed Firestone and Ford to keep the problems from NHTSA as long as possible.

The 1990s tire fiasco was not the first time Firestone had tread-separation and recall problems. Back when the company was known as Firestone Tire & Rubber Co., on October 20, 1978, Firestone

recalled 10 million of its steel-belted radial 500 tires due to reports of treads ripping off, causing the tires to explode at high speeds. The resulting legal actions and damage to the company's nearly 100-year-old reputation led to the merger with Bridgestone in 1990.

## Fisher-Price

THE U.S. CONSUMER Product Safety Commission (CPSC) reported that between 1994 and October 1998, Fisher-Price distributed nationwide, and before 1994, Kransco manufactured and sold nationwide, a total of approximately 10 million battery-powered 6- and 12-volt Power Wheels ride-on children's trucks and cars in almost 100 different models intended for children ages two to seven. Toy and mass-merchandise stores sold the vehicles for \$70 to \$300.

Between 1995 and July 1998, the Power Wheels vehicles were reported to be involved in 116 fires as well as 1800 incidents of the vehicles' electrical components overheating, short-circuiting, melting, or failing. These incidents resulted in at least nine minor burn injuries to children, and up to \$300,000 in property damage to 22 houses and garages. Additionally, Fisher-Price was aware of at least 71 incidents involving the products' failure to stop, resulting in six minor accidents when the vehicle hit a car, pole, window, or fence. Fisher-Price failed to report these problems until March 1997 and, then,

only in response to a February 1997 request from the Commission for a Full Report. According to CPSC Chairman Ann Brown, Fisher-Price knew about these problems for years without reporting to CPSC as they were required by law to do, nor did they voluntarily recall and repair Power Wheel vehicles.

The CPSC settled with Fisher-Price on charges of the company's failure to report serious safety defects of Power Wheels toy vehicles. In agreeing to the settlement and civil penalty of \$1,100,000—the largest fine against a toy firm in CPSC's history, Fisher-Price denied that it knowingly violated the Consumer Product Safety Act. Nonetheless, Fisher-Price recalled up to 10 million Power Wheel vehicles on October 22, 1998 including vehicles sold from 1984 to October 1998.

## Fisse, Brent (1942–)

AUSTRALIAN ATTORNEY and author Brent Fisse is a specialist in trade practices law, intellectual property, e-commerce, and online services and liability control systems for corporations. He developed the theory of "organizational blameworthiness" for corporate crime and has argued that the common practice of imposing monetary penalties as sanctions against corporations does little to deter future bad behavior.

Fisse held a position as a professor of law at the University of Sydney from 1985 to 1996. Between 1993 and 1994, he acted as a part-time commissioner of the Australian Law Reform Commission specializing in trade practices compliance reference. He also served as a part-time commissioner of the New South Wales (Australia) Law Reform Commission from 1987 to 1999. Fisse joined the prominent Sydney law firm of Gilbert + Tobin as a partner on

February 1, 1995 after acting as a consultant to the company for several years.

Additionally, he is the author and editor of numerous books and journal articles on a range of subjects. His publications, including *Howard's Criminal Law* (1990) and *Corporations, Crime, and Accountability* (with John Braithwaite, 1993), address Australian communications law, accountability issues in corporate regulation, and securities regulation in Australasia.

Fisse is perhaps best known for the idea of "organizational blameworthiness" to overcome the approach adopted by courts following the Tesco Supermarkets case. In his view, the Tesco case unduly limited the scope of corporate criminal responsibility by focusing on the conduct of high-level managers.

This so-called directing mind and will approach made it difficult to establish liability against large corporations. Organizational blameworthiness attributes acts and omissions of employees, agents or officers of a corporation to the corporation itself, as long as the relevant person was acting within the actual or apparent scope of their employment or authority.

Fisse has also addressed the issue of penalties for corporate crime. Australian securities regulation is based upon pyramidal enforcement partly because of the influence of Fisse. The features of this system acknowledge the dynamics of negotiation and interaction, the diverse motivations of the regulators, and the need for an explicit pyramid of sanctions and remedies. While fines or monetary penalties are now used extensively as a sanction against corporations, Fisse has suggested that other sanctions would have more of an impact. Stock dilution (equity fines), probation, publicity orders, and community service also merit consideration as additional sentencing options, especially in regard to small companies. By increasing the variety of deterrents, these sanctions offer ways of angling around the major limitations of monetary sanctions.

## Flaming Ferraris

THREE FORMER Credit Suisse First Boston (CSFB) employees, known as the Flaming Ferraris for a cocktail they used to drink, were barred from securities trading, after an inquiry into an attempt to manipulate the Swedish OMX index in 1998. The men were part of a team which boasted of being the world's most successful share traders, making more than £100 million (\$170 million) for their employers, the CSFB investment bank.

The team included David Crisanti, a Princeton graduate in economics; Adrian Ezra, a Harvard-educated squash champion; and ex-Etonian James Archer, who studied chemistry at Oxford. The latter was reported to earn £250,000 (\$426,000) a year. Team bonuses were counted in millions. They enjoyed the best food and drink. It was at a fashionable London venue, the Nam Long Vietnamese restaurant, that they got their nicknames because of their penchant for £14-a-glass (\$24) Flaming Ferrari cocktails.

The trio's downfall came in 1999, when they were suspected of dubious dealings in shares of Swedish papermaker Stora. They were accused of forcing movements in the Stockholm shares index which triggered windfall profits of around £400,000 (\$682,000) on bets and futures deals they had placed. Archer said his finger had slipped on his computer keyboard and he had sold a million shares when the meant to sell 100,000. The team that specialized in equity arbitrage—the exploitation of differences between different stock-market indices—hit the headlines in December 1998 when they were touted as having made money on all but 12 days in 1998, an astonishing achievement given the economic turmoil of that year.

The Swedish stock exchange fined CSFB two million Swedish kronor (\$242,000) for an attempt to manipulate the Swedish stock-market index in the final days of 1998. Swedish brokerage firm Nordiska Fondkommission was fined 1 million kronor for its role.

Archer, Ezra and Crisanti each were employed by Credit Suisse First Boston (Europe) Ltd. Crisanti was global head of Index Arbitrage. Ezra was a vice president in Equity Index Arbitrage responsible for European Index Arbitrage, including the Swedish book. He reported to Crisanti. Archer was a junior trader on the index arbitrage desk, responsible for trading the Swedish book. He reported to, and sat next to, Ezra. The three were close friends. They were found guilty of “a blatant attempt to manipulate the OMX Index on the SSE on the morning of December 29, 1998, and of persistent attempts to disguise the circumstances from SSE Market Surveillance and from CSFB’s compliance department.”

The three were dismissed by CSFB. Nordiska Fondkommission also fired the broker involved. The exchange’s disciplinary committee ruled that the trades took place without the consent or information of the two firms’ management. Nevertheless, the companies are considered responsible for the actions of their employees under Swedish law.

## Food and Drug Administration

THE FOOD AND Drug Administration (FDA) is a government agency housed within the Department of Health, Education and Welfare. It is charged with the enormous task of monitoring the safety, quality, and efficacy of the food, drugs, medical devices and biological products, and cosmetics that enter the consumer market.

The agency’s work is further complicated by the need to keep apace of scientific and technological advances while balancing competing pressures emanating from an ever shifting coalition of politicians, business interests, and consumers. While history suggests that consumers suffer disproportionately if

the agency fails, the high degree of public confidence in the safety of our food and drugs attests to the agency’s success. Unfortunately, the FDA’s current reputation is captive to past tragedies central to the expansion of powers needed to strengthen its regulatory functions.

#### HISTORY

Over the course of the 1800s, states became increasingly unable to coordinate efforts to combat the proliferation of often questionable and dangerous food and drug products. Yet, the framework for the modern FDA was not erected until 1906 when Congress passed the Food and Drugs Act. In response to public outrage unleashed by Upton Sinclair’s *The Jungle*, which exposed widespread unsafe and unsanitary conditions in the meatpacking industry, a new agency was created.

Manufacturers were required to list dangerous ingredients and the agency had the power to seize illegal foods and drugs. While the regulatory functions of what is now known as the FDA have since expanded, the cost of expansion has been a series of high profile tragedies.

The Federal Food, Drug and Cosmetics Act of 1938 was passed in response to the sulfanilamide tragedy. Sulfanilamide was used as an antibiotic in its pill form. In an effort to market the drug in liquid form, in 1937 a drug company used a solvent that produced a lethal mixture linked to 107 deaths. This legislative response made testing and labeling mandatory, and the act has been revised nearly annually in response to new challenges.

Animal testing and clinical trials did not become standard procedure until the 1962 Kefauver-Harris Amendments. These amendments were passed when a U.S.-based drug company sought to market the tranquilizer thalidomide, linked to extreme deformities in European infants. In this case, the FDA successfully safeguarded American consumer interests against the profit-driven motives of powerful pharmaceutical companies.

#### DRUGS AND IMPLANTS

The path of a new drug to market is long and arduous. Any new drug must first be tested on lab animals for more than three years before the manufacturer is permitted to test on human subjects. The drug then undergoes three phases of clin-

*The safety of the American food supply is under the regulation of the Food and Drug Administration.*

ical testing, each with increasing numbers of human subjects receiving the drug in a controlled setting. After a lengthy six-year process, a manufacturer may submit a new drug application with extensive documentation of findings. Approval takes an additional thirty months on average. Once approved, manufacturers enjoy a period of patent protection without competition.

Pharmaceutical companies engage in an ongoing fight on multiple fronts with the FDA to subvert the above process. Industry interests have undermined FDA oversight functions by bribing its officials to relax procedures, falsifying test results, lobbying politicians, and mobilizing disease-specific advocacy groups. When industry succeeds, consumers face considerable danger.

History is riddled with accounts of the disastrous effects of drugs released by companies that knowingly concealed and falsified associated risks. For example, the synthetic estrogen Diethylstilbestrol (DES) was initially distributed in the early 1940s to prevent miscarriage. It was not removed from the market until 1971, despite evidence of dangers that emerged even before manufacturing companies applied to the FDA. DES is now known to cause cancer, sterility, and deformity among the children and grandchildren born to women who took the drug during their pregnancies.

Women were similarly victimized by producers of silicone gel breast implants. In this case, women suffered because the FDA was not given regulatory control over medical devices until 1976, long after silicone breast implants had been on the market. Once FDA powers were expanded, interests organized to resist regulation. Herbert Burkholz details the history of silicone and breast augmentation, suggesting that clear risks emerged shortly after its introduction following World War II. University of Texas studies conducted in the 1970s showed that implants evoked an auto-immune response, causing symptoms such as the hardening of breast tissue, joint pain, and rashes.

The FDA threatened to ban implants in the absence of data demonstrating their safety. The battle that ensued, pitting the FDA and women's advocacy groups against pharmaceutical companies and physicians, continued throughout the next two decades. Philip J. Hiltz contends that the FDA took the politically safe middle road by allowing saline-filled implants while limiting the usage of silicone implants to controlled settings for further testing.

According to Burkholz, pharmaceutical companies were positioned to achieve further victories in the 1980s. Regulation shifted from the public to the private sector as the spread of HIV gave rise to disease-specific interest groups that lobbied Congress for rapid release of potentially life-saving drugs. Their efforts were mirrored by industry and supported by a conservative administration that supported less regulation as integral to competition and innovation. At the same time, drug costs escalated as companies sunk more money into marketing.

Burkholz contends that this atmosphere produced the 1984 Drug Price Competition and Patent Extension Act that curtailed FDA regulatory functions. Pharmaceutical companies could now pro-

duce generic drugs that replicated the existing, more expensive brand-name drugs.

Replication allowed companies to circumvent many phases of the lengthy test process. As an unintended consequence, new drug companies producing only generic drugs entered the market alongside established entities. The FDA faced the new challenge of holding inexperienced companies accountable for mishaps when rising numbers of complaints undermined its ability to file charges.

## SUPPLEMENTS

Events of the 1980s arguably set the tone for government decisions in the 1990s. In 1994, Congress passed the Dietary Supplement Health and Education Act, deregulating the supplement industry. Ironically, writer Michael Specter argues that deregulation extended from public suspicion of pharmaceutical companies' motives matched by a desire for more control over individual health. The appeal of supplements is that they are composed of naturally occurring vitamins, minerals, and medicinal herbs. Natural, however, does not mean safe.

Dietary and weight-loss supplements are not government approved, manufacturers use slippery language to make claims unsubstantiated by tests and data, and they are not obligated to provide warnings about the potential risks of their products. Yet, many supplements aggravate existing medical conditions and are toxic when taken in combination with other supplements or pharmaceutical products.

The FDA once again found itself in uncharted waters. After the much-publicized death of Baltimore Orioles's pitcher Steve Bechler in 2003, the FDA banned the dietary supplement ephedra. Bechler suffered a fatal heat stroke after taking ephedra, which elevates blood pressure, heart rate, and brain activity. Ephedra's active ingredient, the stimulant ephedrine, is common in supplements for weight-loss and improved physical performance. The ban's impact is limited since it does not extend to practitioners of traditional Chinese medicine who use *ma huang*, ephedra's herbal incarnation. Moreover, the ephedra ban covers only one supplement in a booming industry.

Current challenges to FDA regulatory functions extend from a need to accomplish more with fewer employees and a fraction of the budget allocated to other bureaucratic entities. Though often aided by

the efforts of consumer watchdog organizations and advocacy groups that raise money to conduct their own testing, the FDA is at a monetary and scientific disadvantage in its quest to stay ahead of pharmaceutical companies and agribusiness. Perhaps the FDA performs quite well within a complex environment that makes mishaps unavoidable.

## Ford Pinto

IN 1971, FORD Motor Company introduced the Pinto as its entry into the subcompact market. Fighting strong competition for the lucrative small-car market, Ford rushed the Pinto into production in much less than the usual time.

Ford engineers discovered in pre-production crash tests that rear-end collisions would rupture the Pinto's fuel system. Because assembly-line machinery was already tooled when engineers found this defect, Ford officials decided to manufacture the car anyway, even though

Ford owned the patent on a much safer gas tank. For more than eight years, Ford successfully lobbied against a key government safety standard that would have forced the company to change the Pinto's gas tank.

Pinto crashes caused between 500 and 900 burn deaths to people who would not have been seriously injured if the car had not burst into flames. Ford knew the Pinto was a firetrap, yet still paid out

millions to settle damage suits out of court, and was prepared to spend millions more lobbying against safety standards. In late models, the bumper was designed to withstand a collision of only about 5 miles per hour (mph). Earlier bumpers offered even less protection to the gas tank.

Internal Ford documents demonstrate that Ford crash-tested the Pinto at a top-secret site more than 40 times, and that every test made at over 25 mph, without special structural alteration of the car, resulted in a ruptured fuel tank. Yet, Ford executives denied under oath having crash-tested the Pinto.

Only three cars passed the test with unbroken fuel tanks. In one of them, an inexpensive lightweight plastic bladder was placed between the front of the gas tank and the differential housing, so four bolts would not pierce the tank. In another successful test, a piece of steel was placed between the tank and the bumper. In the third test car, the gas tank was lined with a rubber bladder. But none of these protective alterations was used in the mass-produced Pinto. When it was discovered the gas tank was unsafe, no one told Ford chief executive Lee Iacocca, who insisted that safety concerns take a back seat putting the car into production, and that the car not weigh over 2,000 pounds or cost more than \$2,000. Iacocca feared that adding even \$25 more to the car's cost would price the Pinto out of the small-car market.

In June 1978, Ford was forced to recall 1.5 million Ford Pintos and 30,000 Mercury Bobcat sedan and hatchback models. The action was the result of investigations by the National Highway Traffic Safety Administration's (NHTSA) Office of Defect Investigations. In April 1974, the Center for Auto Safety petitioned the National Highway Traffic Safety Administration to recall Ford Pintos. The Center's petition was based upon reports from attorneys of three deaths and four serious injuries in Pinto accidents. This petition languished in the NHTSA offices until 1977.

In 1977, Mark Dowie of *Mother Jones* magazine, using documents in the Center files, published an article reporting the dangers of the fuel tank design, and cited internal Ford Motor Company memos proving that Ford knew about the fuel tank problem before the vehicle was produced, but that a cost/benefit memo concluded that it would be "cheaper" for Ford to pay liability for burn deaths and injuries rather than modify the fuel tank to pre-

vent the explosions. Following the publication of Dowie's article, an Orange County, California, jury, awarded Richard Grimshaw \$125 million in punitive damages for injuries he suffered as a passenger in a 1971 Pinto struck by another car at 28 mph. The award was reduced to \$3.5 million. The jury wanted punitive damages to be more than Ford Motor Company had made in profit on the Pinto (\$124 million).

An Elkhart, Indiana grand jury returned indictments against Ford for three cases of negligence from the deaths of three young women burned in Pintos. But on March 13, 1980, a jury found Ford innocent of a charge of failing to warn about or offer to repair fuel system defects in the Pinto before the day the three women were fatally burned. The verdict was not an unfavorable precedent with regard to criminal prosecution of corporations for defective products that can kill, and the possibility of successful corporate criminal liability suits in the future remains open.

## Ford, Gerald R. (1913–)

GERALD FORD HOLDS a unique position among American presidents because he is the only president never elected by the electoral process. When Spiro Agnew (1918–) resigned as Vice President of the United States on October 19, 1973, after having been accused of taking bribes as governor of Maryland and after being indicted for income tax evasion, President Richard Nixon invoked a provision of the 25th Amendment that allowed the president to nominate a new vice president when the office was vacated.

The effectiveness of the Ford administration was threatened from the beginning by the aftermath

of the Nixon Watergate scandal and the general political unrest of the times. The Ford Department of Justice (DOJ) was heavily involved in stemming the white-collar crime and government corruption that had been rampant during the Nixon years. Federal investigators were also burdened by the effects of the Vietnam War, chasing down and prosecuting those who evaded the draft. While Attorney General Edward H. Levi directed efforts at stemming and prosecuting business and government corruption, the president was kept busy fighting with Congress over the War Powers Act, which affected the administration's ability to engage United States troops in combat abroad.

Ford's legacy in white-collar crime may be derived from his handling of Nixon's role in the Watergate scandal. Seeming to forget that "truth [was the] glue that holds governments together," in September 1974, Ford suddenly and secretly pardoned Nixon who had been named as an un-indicted co-conspirator in the Watergate trials. Reaction to the pardon was swift, and Ford's legitimacy as a reform president was tarnished as a sense of betrayal enveloped the nation. Thus, Ford's legacy is one of pardoning perhaps the highest-ranking, most elite white-collar (alleged) criminal in the history of the United States: Nixon.

Ford began the move toward government deregulation that would continue with Jimmy Carter and which would go into high gear with Ronald Reagan in the 1980s. Ford used the Council of Economic Affairs (CEA) to analyze the effects of deregulation and begin the process of putting such policies into effect. Ford also created the Economic Policy Board (EPB), which was given the responsibility for coordinating domestic and foreign policy for the Ford administration. Along with the move toward deregulation, Ford initiated a move toward enhanced federalism that would also reach its height under Reagan, with states being given more control and responsibility in various social and economic programs.

Ford's long experience in the House of Representatives helped him in the presidency, and he generally enjoyed a good working relationship with Congress. Yet, because Congress was in the process of restoring its presence as an equal power in the three-branch government, Ford was often unsuccessful at gaining Congressional approval of his proposals. He did have some major successes, including in 1974 when Congress passed the Em-

ployee Retirement Income Security Act that regulated private retirement benefits.

Ford also worked with Congress to raise the minimum wage and extended it to domestic and farm workers. Among the Democrats, he won some support from Democratic women for his strong support for the Equal Rights Amendment that would have prohibited discrimination on both national and state levels on the basis of sex. Ford's electoral defeat in 1976 was cemented by inflation, recession, high unemployment, and the aftermath of the Nixon pardon.

## Foreign Corrupt Practices Act

IN THE WAKE of Watergate and several corporate scandals in the 1970s, Congress and the Security and Exchange Commission (SEC) turned their attention to investigate corporate business practices. A SEC survey covering a large number of American corporations revealed that about 350 corporations were involved in bribing of foreign officials and were contributing to political campaigns of foreign politicians to the tune of \$750 million in order to receive lucrative government contracts.

Major oil companies (for example, Gulf Oil, Mobil Oil) and defense contractors (Lockheed, Northrop, Boeing, McDonnell Douglas) were involved in some of the well-known bribery cases. For example, the Lockheed Corporation admitted paying out more than \$22 million to officials and political organizations in several different countries including Indonesia, Iran, and the Philippines.

One of the most notorious cases in the 1960s involved the \$1 million paid to Prince Bernhard, the husband of Queen Juliana of Netherlands, for his

help in arranging the sale of fighter planes to the Royal Dutch Air Force.

Another major Lockheed bribery affair occurred in Japan in 1972 when, among other officials, Prime Minister Tanaka was paid off in a multi-million dollar deal to buy 230 Starfighter airplanes for the Japanese Air Force. This case became one of the major political scandals in postwar Japan and led to the arrest of Tanaka. Several other major international bribery cases were revealed during the early 1970s. The ensuing international scandals had adverse effects on U.S. relations with several foreign countries and made it harder for American companies to conduct business as usual in some of them.

The U.S. Congress responded to this situation by enacting the Foreign Corrupt Practices Act in 1977 making it a crime for American companies and their subsidiaries to bribe foreign government officials. The main aim of this act was to deter the bribery of foreign officials by including harsh penalties for violation. Violations were punishable by a prison term of up to five years and a maximum fine of \$250,000 for an individual and \$2 million for a corporation. The act had an accounting provision as well which required that corporate books and records be maintained in detail and reflect correctly the corporations' financial situation.

#### MINOR BRIBERY

There was pressure from the business community to exclude from the act the relatively small payments paid to foreign clerical officials in order to expedite the issuance of various licenses needed to complete transactions with their governments. American companies doing business abroad claimed that these payments are not only customary, but also necessary in certain countries to facilitate the routine governmental contracting process. These arguments did influence Congress, and in 1988 it excluded this kind of minor payments from the act.

Also, there were two exceptions that critics consider as loopholes in the act. One allowed payment for promotional expenses such as travel and lodging for foreign officials who visit a company's plant to view a demonstration of the product. Second, payments were allowed that were considered lawful according to the laws and regulations of the country with which the business transactions were conducted.

American corporations claimed that the Foreign Corrupt Practices Act put them at a disadvantage with their competitors from other countries that did not have comparable legislation. However, in the current international marketplace where many major corporations are multinational, it is possible to continue paying off foreign officials by using subsidiaries located in countries that do not have laws prohibiting this kind of practice.

## forensic auditing

ALSO REFERRED TO as forensic accounting, forensic auditing has been defined as an accounting analysis that is performed with a probability of later use in either a civil or criminal legal proceeding. In many criminal investigations, especially those involving criminal enterprises, the mantra "follow the money" is regularly heard; forensic auditing answers that demand.

Through adaptation of accepted accounting procedures, assets can be tracked to their origination and later disbursement. Similarly, forensic auditing can establish if spending patterns are indicative of criminal activity.

Forensic auditing can therefore be divided into two broad classifications: litigation support and investigative accounting. Forensic auditors perceive the information-gathering process as more than a review of ledger information but as research into the operation as a whole. Accounting, auditing, and investigative skills are utilized to obtain an under-

standing of an operation. Does the accounting of the operation explain the flow of monies in and out of the system; is there any indication that any transaction have been reported in such a way as to disguise its origin; is there any indication that criminal activity is taking place; and is any transaction designed to avoid federal reporting criteria?

## WHAT AN AUDITOR DOES

Specific antifraud duties a forensic auditor conducts include:

*Business/internal employee fraud:* the investigation of a business operation to ascertain if fraud exists, and if it does, to what extent and committed by whom. Additionally, a quantification of the loss is made, as well as a recommendation on methods of recovery. The process would also include the development and implementation of internal rules to prevent a reoccurrence.

*Business economic losses:* the involvement of the audit process to identify and quantify certain economic losses, that is, contract disputes, product liability, patent infringements, and construction breach of contract claims.

*Business interruption losses:* cases in which a forensic auditor is assigned to quantify the amount of calculated losses.

*Criminal investigation:* the involvement of the audit process in cases which will require information to be later presented at a criminal proceeding. The auditor can be retained by a law enforcement agency or by a party to the action.

*Matrimonial disputes:* forensic audits are utilized in disputes of this type to verify the assets of parties to a matrimonial dispute, quantifying the assets present as well as identifying any attempt to conceal assets.

*Professional negligence:* forensic auditors can quantify losses in cases involving alleged negligence of professionals other than accountants, and in cases involving accountants, they can both quantify losses as well as review adherence to generally accepted auditing or accounting principles.

*Shareholder claims:* cases in which forensic auditors are retained to examine claims by made shareholders of mismanagement, and possibly criminal fraud by company management. Recent cases of this type have involved Enron Corporation and WorldCom, with shareholders alleging losses due to fiscal mismanagement by upper management.

The usage of forensic auditing in investigating criminal enterprises is essential to prosecution efforts; the trail of money will provide investigators and prosecutors with evidence with which to charge individuals, possibly with Racketeer Influenced Corrupt Organization (RICO) charges. The majority of many criminal enterprises are cash operations, often in amounts that would require the filing of mandated federal banking documents. Criminal enterprises need to conceal the origin of their illegally obtained profits and seek to do so through money-laundering, transferring monies back and forth through various accounts. In other cases, some criminals decide to enjoy the fruits of their labors and begin to spend money in amounts beyond their earning capabilities.

One forensic auditing technique is the net worth audit. In this type of audit, the amount of verifiable spending a person has done over a period of time is compared to verifiable earnings over the same time period. Even with legitimate jobs as sources of income, an unexplained difference in spending versus earnings will be exposed. Gambino crime family member John Gotti, known for his extravagant spending style, including thousand-dollar designer suits, claimed that his employment as a plumbing supply salesman was his only source of income.

## UNDER THE VEIL

Forensic audits are often able to remove the various subterfuges employed to conceal the trail of money, including violations of federal banking laws. For example, in an attempt to bypass the required federal notification of any cash transaction over \$10,000; smurfing (making a series of lesser transaction) is often employed. Forensic auditors would be able to trace the smurfing activity and provide evidence of intent to the prosecutors. Forensic audits would also be able to identify collusive banking institutions that assist in the criminal concealment of laundering transactions.

One noted forensic audit was Operation Tradewinds, a federal investigation in the late 1960s which involved following large amounts of illegally obtained money from casinos in Las Vegas sent to the Bahamas and then back to the United States. The criminal organizations involved took advantage of banking laws in the Bahamas that would normally be advantageous in laundering the funds.

However, through the use of forensic audits, the veil of offshore banking was uncovered: 13 criminal investigations were opened and \$25 million in taxes and penalties was recovered.

Other investigations assisted by forensic auditing include corporate compliance investigations and due diligence investigations. In corporate compliance audits, adherence to state and federal financial regulations is reviewed. Due to a myriad of complex financial regulations, which often deviate slightly from state to state and within various federal and international programs, forensic auditors can review the business operation to ascertain that all pertinent guidelines are being followed. If violations are noted forensic auditors can then determine if the actions were accidental or intentional acts to conceal illegal activities. Secondary phases of compliance audits can involve environmental and labor rules, including adherence by subcontractors. If an affiliated manufacturing partner is in violation of Environmental Protection Agency (EPA) guidelines (for example, spillage of hazardous waste into the water table), the senior company can be held civilly liable. The forensic audit can determine if the actions are intentional and therefore criminal in nature.

Labor violations by subcontractors can both cause legal and public relations complications for corporations. Forensic auditors can review employment, payroll, and production records to determine if management is attempting to conceal labor issues from the senior corporation. In recent years Nike, Wal-Mart (Kathie Lee Fashions), K-Mart, Land's End and J.C. Penney have all faced allegations in the press of violations of labor laws by subcontractors.

Due diligence investigations often involve pre-merger activities of corporations; with the acquiring company determining the fiscal strength of the company to be purchased. The focus of the forensic audit in these cases is to determine if any questionable financial accounting procedures have been utilized in an attempt to strengthen the fiscal outlook of the company to be purchased. Also, the ownership of the company is reviewed to learn if any hidden owners exist, and, if so, their reason for concealing their identities.

Forensic auditors will review current contracts to develop their accuracy and value, to see if the contracts are "paper tigers" contracts written not to produce revenue, but only to create the appearance of future revenue. Additionally, secondary business

units are reviewed to ensure that their financial structure is sound.

Several professional forensic auditing organizations currently exist, including the American College of Forensic Examiners, the Association of Certified Fraud Examiners, and the Forensic Accountants Society of North America. These organizations strive to advance the professionalism of forensic auditing through establishing accepted standards and certification programs. The *Journal of Forensic Accounting* provides recent empirical and theoretical studies in the forensic auditing field.

## forgery

FORGERY IS GENERALLY understood to be the falsification of a person's signature, usually on a check, a deed, or some instrument of importance. The crime of forgery assumes an intent to defraud, with a non-genuine item being offered as genuine. Forgery is also referred to as *uttering* which is defined as: offering as genuine an instrument that may be the subject of forgery and is false with the intent to defraud. In some instances the act of counterfeiting is used synonymously with forgery.

Forgery is the integral component of many frauds and scams; it can be a criminal act unto itself but is often a part of criminal operation. Art forgery was originally believed to be a type of homage to the great masters, but once the forgeries were sold commercially for profit the threshold of criminal forgery was met. Forgeries range from the common, signatures on checks, to the rare, incarcerated

prisoners obtaining their releases with documents they produced in the prison print shop. Some examples of forgery include:

*AKC registration record forgery:* involves the forgery of American Kennel Club (AKC) records to identify the pedigree of individual dogs and their litters. Forgeries have been uncovered in which potential buyers of certain pedigree lines have later learned that their purchases were based on forged AKC registration documents. Similar attempts have also been noted in the thoroughbred, feline, and rare-bird industries.

*Antiquities fraud:* involves the forgery of items, excluding archeological, art works, and literary works claimed to be from various time periods. This fraud types includes works such as furniture, weapons and clothing, and antiques in general. As with the works of the grand masters of art, some forgeries are so convincing that legitimate dealers and collectors are often victims of the scam. Casual collectors are easily talked into buying these forgeries especially if a spectacular story is attached to the purchase, or in cases where the buyer believes that they are “scamming” the seller and getting a prized collectible for an incredible bargain. As is the sign of a perfectly executed scam in many instances the victim will never know that a fraud occurred.

*Archeological forgery:* the forgery of fossils and related items. One noted example is the 1999 discovery of the Archaeoraptor, offered as the missing link between dinosaurs and birds. Detailed inspection later revealed that the fossil was actually a composite created from five specimens from at least two different species. Other archeological forgeries include the Holly Oak pendant, a drawing of a mammoth on a seashell “discovered” in Delaware; the Calaveras Skull, the only evidence of Pliocene Man in North America; Piltdown Man, the jaw of the missing link proving the evolution of man from apes “discovered” in Sussex, England; and the Lenape Stone, an “unearthed” aboriginal carving which was offered as proof that mammoths roamed North America.

*Art forgery:* has been detailed in both print and films, highlighting some notable art forgers. In some situations, art forgers have later been recruited to detect forgeries, yet allegedly on more than one occasion, they have verified the authenticity of their own forged works. John Drew, a noted English art forger, would forge an artwork and then forge documents concerning the piece’s history which would

later be found by researchers seeking to authenticate the work.

Other noted art forgers include Elmyr de Hory who is said to have forged over \$60 million dollars of Renoirs, Modiglianis, and Matisses with many of his works still hanging undetected in museums and galleries; Guy Hain who flooded the art market with forged versions of Rodin’s bronze statues and generated over \$25 million in sales; Tom Keating who began his painting career as a house painter but went on to forge the works of Degas, Renoir, Goya, and Rembrandt, allegedly producing more than 2,000 forgeries; and Brigido Lara who forged over 3,500 pieces attributed to the Vera Cruz culture and is now employed as an expert to detect other forgeries from that period.

*Autographed sports memorabilia:* involves the forgery of noted sports figures either on items related to their sport (baseballs, footballs, boxing gloves, and helmets) or on non-sports related items (paper, pictures, autograph books). Autographs of famous sports figure, such as Mohammed Ali, Pél , Barry Bonds, Sammy Sosa, Babe Ruth, Mickey Mantle, Joe DiMaggio, Michael Jordan, Joe Montana, and Venus Williams are highly sought and collectors are willing to pay premium amounts for them.

As many sports memorabilia are obtained “in the field,” later signatures are not always an exact match, and as sports figures age their handwriting changes. These differences make authenticity comparison difficult. Many memorabilia forgers will either produce photographs of them near the sports figure featured or forge certificates of authenticity to convince wary buyers.

*Check forgery:* involves the forgery of either the check itself or the signature. In some cases, the check itself is a forgery, using either legitimate or fraudulent account numbers. The forged instruments are then often used to purchase retail merchandise that is then converted to cash. The forged checks are often cleared by some check verification systems as the legitimate account numbers will not be declined for acceptance until the first forgeries are declined at the bank.

The fraudulent account numbers will have no negative history (insufficient funds or closed account), and since many verification services use a negative database to identify at-risk checks, these checks will not be declined. Often, the persons attempting to pass forged checks will have fraudulent identification in the name of the check account

holder. The second forgery type involves legitimate checks in which the signature or other information on the check is altered. In cases where a checkbook is stolen, the name of the account holder is written by the person now attempting to use the stolen check. If a check that has already been filled-out has been stolen, either the amount, payee, or payer can be forged, often removing any of the information through a check-washing process.

*Coupon forgery:* involves the forgery of legitimate coupons and the creation of fraudulent coupons to defraud retailers. Forged coupons are either presented by the forgers or are sold to second parties. To create the look and feel of legitimate coupons, efforts are made to print the forgeries on newspaper stock and then subject to short periods of harsh treatment to replicate a purse-worn quality. Some coupons are embossed with the universal product code (UPC) bar codes to pass register-scanning verification processes.

Forged coupons have been issued against a range of retailers, including sandwich shops, appliance stores, discount stores, franchise automotive repair shops, hotel chains, pharmacies, and service companies. Additionally, some coupons are manufactured in volume, not to be presented at individual retailers but sold to criminally complicit retailers who redeem them as part of their retail operation.

*Currency forgery:* often referred to as currency counterfeiting, this forgery concerns the replication of a country's currency. With the introduction of the euro in 2002 and its 96 variants of coins and bills, forgers took advantage of the public's untrained eye and ability to discern real euros from forged versions and produced multiple forgeries. U.S. currency is the currency most forged, due to its underlying economic strength and acceptance worldwide.

As such, it utilizes state-of-the-art anti-counterfeiting technology. Professional currency forgers now share the illegal market with amateurs who use color copiers and laser printers. Some forgeries simply involve the alteration of currency (a separate criminal offense), that is, covering the four corners of a \$1-bill with corners from a \$20-bill, or taping the halves of different denomination bills together (showing the higher denomination when passing the altered bill). The forgery of other government obligations, for example, bonds and postage stamps, would be included in this classification.

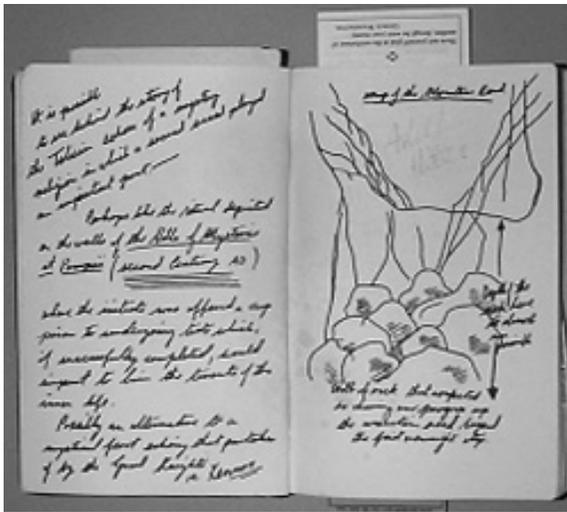

*Exam results forgery:* involves the falsification of various exams, including the SATs, professional licensure, stockbroker-certification courses, federal and state civil service examinations, chauffeur-driving tests, and high-school exit exams. Some of the score forgeries are perpetrated by teachers whose salaries are tied to passing rates, while in other cases, the forgeries are executed for monetary reasons. In some instances, the forgery effort is pervasive throughout an organization, while in others, only one person may be involved.

*Internet forgery:* involves the takeover of a legitimate website so that "spam" messages may be sent through the legitimate site. The act of forgery involves causing a false originating-sender to be identified on the electronic transmission. One case involved messages concerning pornographic websites and get-rich schemes that were disguised to appear that they were coming from an IBM website. Other internet forgeries involve a fraudulent sender-address being assigned to incoming emails for other than commercial reasons, that is, harassment or concealment of criminal activity.

*Government documentation:* involves the forgery of any of a myriad of government documentation including social security cards, birth certificates, death certificates, retailer permits (alcohol, cigarettes), immigration status documentation, import/export verifications, passports, identification cards, vehicle inspection tags, drivers' licenses, health department immunization records, tax stamps, and professional certification documents (taxi driver permits, mechanical operator's licenses, nursing licenses, etc.). The forged documents are sometimes the end result of the criminal activity and, in other instances, the forgery is only a part of a criminal operation.

*Insurance-fraud related forgeries:* involves the forgeries of any documentation utilized in the furtherance of an insurance fraud. These documents can include altered or totally fraudulent police reports of accidents and crimes, tax returns and W-2 filings to claim increased losses, medical reports and records to exaggerate the seriousness of the injuries suffered.

Forgeries of this type can also involve birth certificates as noted in the recent 9-11 World Trade Center incident, in which several persons filed insurance claims for nonexistent family members who were "killed" in the attack. In worker-compensation fraud cases, often timesheets or trip sheets are al-

Pages from "Hitler's Diary," one of the classic cases of literature fraud that sold for \$4 million.

The alleged burial box of James, brother of Jesus, turned out to be a prime religious artifact forgery.

tered to secure coverage that is applicable only if the injury occurred during working hours and in the completion of work assignments.

**Literary forgery:** involves the alleged authenticity of certain literary works to be genuine as to either authorship or content. Some noted examples include: Clifford Irving's "autobiography" of Howard Hughes in 1972 which was discredited by Hughes before its publication; Konrad Kujau's *Hitler's Diary* (a forgery that was purchased by West Germany's *Stern* magazine for \$4 million in 1983, and was later discovered to be printed on paper manufactured after 1950; and Leonard Lewin's *Report From Iron Mountain* released in 1976 which claimed to be a report of a government sponsored think-tank on the need for the United States to be at war as permanent peace in the world would destabilize the country. The government immediately denied the existence of any such government sponsored group or report; however the book became a *New York Times* bestseller and ultimately translated into 15 languages. In 1972, Lewin admitted that he created the entire report after reading an article on a Wall Street stock market dip caused by a peace scare.

**Medical records forgeries:** this fraud involves the alteration of medical records, surgical notes, nursing notes, medication records, intake notes (allergies), progress notes, doctor's notes, discharge summaries. The forgeries are often related to litiga-

tion or possible litigation, concealing a medical or nursing act of malpractice either through omission or commission. Additionally, some prescription records are forged to facilitate the theft of narcotics by medical personnel, that is, charting that a narcotic was given to a patient but was actually taken by the caregiver. In other cases, narcotics are designated as damaged or "wasted" (entire amount was not given to patient and remaining amount was poured into medical waste container or sink) when in actuality, the caregiver retained the narcotic.

**Nongovernmental documentation:** involves the forgery of documentation emanating from the private sector rather than the public sector. These documents include: high school and college transcripts, corporate letters of credit, corporate letters of reference, bills of lading, event tickets, proof-of-insurance, and proof-of-purchase records.

**Nonsports related autographs:** involves the forgery of autographs of figures in history, literature, Hollywood, and science. Examples of commonly forged autographs include John F. Kennedy, Neil Armstrong, Ernest Hemingway, Samuel Clemens (Mark Twain), Albert Einstein, Thomas Edison, the Beatles, Elvis Presley, James Dean, Bruce Lee, Marilyn Monroe, Judy Garland, Elizabeth Taylor, and Barbra Streisand.

**Prescription forgery:** involves the forgery of legitimate prescription forms or the counterfeiting of prescriptions pads in an attempt to obtain con-

trolled substances from pharmacies. These forgeries can involve either the alteration of a properly obtained prescription from a healthcare provider, either to obtain a larger amount of the prescribed medication or to change the medication type; or the total forgery of a prescription through theft of a physician's prescription pad or the counterfeiting of a prescription pad. Additionally, in some cases, pharmacists have forged prescriptions to facilitate their ability to procure certain narcotics either for personal use or for resale.

*Product forgery*: also referred as counterfeit goods, this type of forgery involves the manufacture and sale of desired objects (CDs, DVDs, designer clothing, sunglasses, computer software, brand merchandise, computer chips, Rolex watches, insignia hats and shirts, golf clubs, videogames, handbags, etc.) This merchandise is often touted as "real" and results in sales being stolen from manufacturers, and consumers buying substandard goods, albeit at a reduced price.

*Religious artifact forgeries*: involves the forgery of items said to have religious, as well as archeological importance. A recent case (July 2003) involved the "discovery" of the burial box of Jesus' brother James. The item had been valued at over \$1 million until additional research and the discovery of partially completed other forgeries were found at the dealer's home.

*Stamp forgery*: the forgery of philatelic items is a growing industry as the value of certain stamps increase in value. Forged stamps include both domestic and foreign issues. In response to these forgeries, websites such as the "Comparative Stamp Forgery Identification Site" display examples of philatelic forgeries as well as identify some noted forgers.

*Travelers' checks, money orders, cashier checks*: involve the forgery of nonchecking banking instruments. Due to the proliferation of companies offering these services, retail clerks are not always able to identify forged or counterfeit versions.

## France

AN IMPORTANT PROPAGANDA factor in preparing the French Revolution of 1789 was the Diamond Necklace Affair of the 1780s. Although just a trickery (a Cardinal was encouraged by impostors to corrupt Queen Marie-Antoinette with a necklace, which never reached her), it had an immense anti-feudal impact on French society. During the Revolution, corruption and usury of grain or bread dealers and armament suppliers were a constant theme; thus, the young Napoleon Bonaparte gained public favor with get-tough policies against abuse during his first campaign in Italy.

### CORPORATE CRIME

But the golden age of business crime and scandal in France was the Third Republic, especially the years from the 1880s to World War I. Some of the effects from this period are still important today, such as the Panama Canal, projected as comparable to the Suez Canal some years before by the French engineer Ferdinand de Lesseps.

The ambitious plan failed as a French enterprise not necessarily due to technical problems arising from the construction of such a gigantic project (to be finished later by the United States), but due to the corruption of the French political class. When the Panama scandal broke, it had an immense impact on the parliamentary elections of 1893, when the Assembly was purged of all those politicians implicated in the scandal.

During World War I, the subject of war profiteers reappeared. The link between business crime and the republican democracy, installed in France after 1870, was always used by the political enemies of this system to discredit it. The Panama, and

other scandals before 1900, were unsuccessfully used by monarchists to try to get rid of the republic, and an anti-Semitic notion became imminent with the infamous Dreyfus Affair.

In the 1920s more modern fascist organizations, with some elements within the industrialist bourgeoisie, tried to undermine the democratic aspects of the French form of government, whereby anti-Semitic tendencies gained more and more importance. A decisive step was the Stavisky affair in 1933–34, when the bank *Crédit Municipal de Bayonne* collapsed. It turned out that the known swindler, Serge Stavisky, an emigrant of Jewish origin in Russia, was the founder of this bank and had corrupted his entrance to the banking business with gifts to many important politicians. While the affair was investigated, Stavisky died in an incident which was officially labeled as a suicide.

The extreme right gained some public support from this affair and (not only for this reason) tried an unsuccessful coup on February 6, 1934. When, in 1936, the *Front Populaire*, that is, a government of socialists and communists, took office, the extreme right became even more violent. The secret right-wing association, *La Cagoule*, (the Hood) plotted to murder representatives of important associations of employers and to blame the left for such atrocities.

The plan failed, but when Nazi Germany invaded France in May–June 1940, some elements from these right-wing extremist groups slipped into office of the collaborationist administration of France (the Vichy government). Under German supervision, robbery of Jewish property in France started, and French collaborators and German occupiers profited alike.

#### POST-WAR BUSINESS

After the liberation of France in 1944–45 by Allied and French troops, the economic system of France changed dramatically. Industrialists like the car and motor manufacturer Renault were expropriated by the new Charles de Gaulle government for its guilt while collaborating with the Nazi invaders. Although France remained a capitalist country, strong planning measures by the government were introduced against former abuses of economic power and, more importantly, for a speedy reconstruction after World War II. This change within the economic system had dramatic consequences for the

development of business crime. Because of the strong link between the bureaucratic and political elite of the state, and the directors of state-owned production facilities, nearly every business scandal became a state affair. This web of state and industry was only untangled during the late 1980s, but the scandals dating from the postwar era still haunt the French political life. The liberal-right President Giscard d'Estaing lost his office to the socialist Francois Mitterrand in 1981. One reason for this change in the presidency of the republic was due to the fact that D'Estaing was under strong suspicion of having received diamonds as a "private gift" from the self-proclaimed Emperor Bokassa of Central Africa. But this was probably a minor charge compared to the scandals to follow during the 14 Mitterrand years (1981–95).

#### THE MITTERRAND YEARS

It started in 1981 as a government alliance of French socialists and communists, but the latter very soon left the government. After a second phase of nationalization of important segments of the economy during the early Mitterrand presidency failed, a liberal-right government under the socialist Mitterrand (called cohabitation in French constitutional terms) started a re-privatization program. During this period, many private "deals" regarding state property were done, and the sale of new stocks to the public failed due to an untimely bear market.

Nevertheless, at this point, the idea of public-owned production facilities lost momentum and nationalization gave way to re-privatization. Whereas the blame for the problems and corruption scandals of the re-privatization process was on the liberal-right parties, the socialists up to the prime minister had to answer questions in public and in court for their involvement in an AIDS scandal (known contaminated blood in hospitals was distributed to patients for economic reasons and because of neglect). Strange figures like the Olympic-Marseille soccer club president appeared on the socialist political stage, later to disappear in courtrooms and prison. Mitterrand was heavily involved in the affairs and scandals, but spared from prosecution by immunity while in office, and by dying soon after leaving the presidency.

The last major scandal originating in this period is the Elf-Aquitaine oil company trial, in which the

state-owned industry became a large distributor of bribes inside and outside of France, and became involved in state intelligence matters which were still being investigated in 2003.

Another major event was the Crédit Lyonnais bank scandal in the early 1990s. Prime Minister Pierre Bérégovoy committed suicide immediately after leaving office in 1993, probably because of (unproven) corruption charges against his government. Edith Cresson, another prime minister of the Mitterrand period, was later appointed the French member of the European Commission, and then became the major cause for the resignation of the whole Commission after corruption allegations in 1999. Jacques Chirac, the Gaullist party successor of the socialist Mitterrand to the French presidency, was still dogged by corruption scandals during his nearly 20 years as mayor of Paris.

#### ORGANIZED CRIME

Business and organized crime in France have strong regional aspects. The southern parts of France and the island of Corsica have maintained, for generations, a structure which is very similar to the Italian Mafia. Whereas the famous movie, *The French Connection*, even brought it to Hollywood fame, one has to distinguish the continental parts of southern France and Corsica. Southern France is riddled with shadow economies, corruption of local authorities, bribery for any kind of public services, and arson in summertime for speculation purposes that destroys large forest areas every year.

Although members of all political parties were involved in criminal activities, the extreme right especially profited since the 1980s from such events in cities like Toulon and Marseille, only to further such criminal activities when elected to office. In Corsica, the problems are basically the same, but the criminal acts are often declared to be politically motivated by persons seeking the independence of Corsica from France.

In fact, all the forms of violence and criminal acts are the actions of a mafia-like structure, not of an independence movement. The French state has tried for years to solve this problem by an approach linking criminal investigations and political compromise in an autonomous regime in Corsica, but has failed so far, and has committed several ill-conceived undercover operations (burning property of members of the Corsican Mafia, for example).

## Frankel, Martin (1955—)

MARTIN FRANKEL, A MONEY manager and former stock broker, orchestrated the largest insurance fraud in U.S. history. Frankel took over small insurance companies in several states, using pseudonyms and a variety of front persons and companies, and then stole their assets. He placed large sums of money in Swiss bank accounts, and financed an extravagant lifestyle that included international travel and expensive spending sprees.

Frankel was a Toledo, Ohio native who gained notoriety because of his illicit activities, and also because of his eccentric lifestyle. A stockbroker until he was barred from trading by the Securities and Exchange Commission (SEC) in 1992, Frankel continued in the field, running an unlicensed brokerage firm, Liberty National Securities, Inc. (LNS). In addition to LNS, Frankel ran two other financial fronts, Thunor Trust and the St. Francis of Assisi Foundation, all fronted by prominent figures, lending credibility to the scheme. Thunor Trust was Frankel's key vehicle for taking over insurance companies.

Thunor Trust purchased the companies, and placed the insurance premiums in its supposed investment firm, LNS, at which point Frankel would embezzle the funds. From 1990 to 1999, he took over several small insurance companies and collec-

tively looted over \$200 million in assets. The companies were housed in Oklahoma, Mississippi, Tennessee, Missouri, and Arkansas.

Frankel has been described as “a short, skinny figure with thick Woody Allen-ish eyeglasses” (always worn askew), who was “nebbishy” and “reclusive.” Nevertheless, his ill-gotten wealth allowed him to satisfy his appetite for sado-masochistic sex, courting women, including Eastern European women via the internet and through personal ads to his compound where he would address their material needs in return for favors.

Frankel kept approximately 20 women around the compound, and, in addition to providing them with office “jobs,” he purchased luxury cars and fur coats, and took them on shopping sprees in some of New York’s most fashionable stores. His compound consisted of two mansions located in Greenwich, Connecticut’s backcountry, a remote area of multi-million-dollar estates, woods, and horse trails. The primary property was a \$3 million stone mansion, outfitted with video surveillance cameras, numerous offices, over 80 computers, and large screen televisions to watch various financial news programs. Frankel also owned a fleet of luxury cars in addition to a few private planes, and employed a host of bodyguards.

#### ON THE LAM

At some point in late April 1999, Frankel realized authorities would soon unravel his financial conspiracies. He fled to Rome, Italy, on May 5, 1999. Frankel left his workers with hastily drawn orders to shred incriminating documents. Apparently discouraged by the time-consuming shredding process, some of Frankel’s assistants attempted to burn documents.

An automatic alarm called firefighters out to the high-security mansion, where they found a file cabinet ablaze and documents burning in two fireplaces. Among many incriminating documents found by responding firefighters and police officials were a “things-to-do list” that included such items as “launder money” and “Get \$ to Israel get it back in,” and astrological charts designed to answer such questions as: “Will I go to prison?” “Should I leave?” and “Will I be safe?”

Based on these discoveries and subsequent investigations, a warrant was issued for Frankel’s arrest on May 16, 1999. The international manhunt

for Frankel began as Interpol (international police) issued its highest alert (red notice) for him.

After a short stay in Rome, Italy, Frankel left for Germany. He eventually checked into the Hotel Prem in Hamburg under the name of Roger Ellis. His anxiety increased as he read the daily U.S. news coverage of his exploits. One of the female companions who accompanied Frankel on his trip abroad to avoid prosecution eventually feared for her own well-being. She contacted her lawyer in the United States, providing him with explicit instructions to contact authorities regarding Frankel’s location.

#### DIAMONDS AND FALSE PASSPORTS

Frankel was arrested on September 4, 1999 in his hotel room by German state and federal police working in conjunction with U.S. Federal Bureau of Investigation (FBI) officials. German authorities charged Frankel with failing to pay import duties on 547 diamonds (net worth \$8 million) and possessing nine false passports (two British and seven Greek). He was convicted on September 20, 2000, and sentenced to three years in a German jail. However, Frankel was soon extradited to the United States in March 2001 to face the more important fraud charges.

Nine of Frankel’s associates pleaded guilty to a variety of racketeering, fraud, and money-laundering charges at the state and federal levels, and a tenth was found guilty in court. In May 2002, Frankel pleaded guilty to 24 federal counts of securities fraud and racketeering, and he later pleaded guilty to numerous charges at the state level. Frankel faced up to 150 years in prison and over \$6.5 million in fines in early 2004 with final sentencing pending.

## free enterprise

THE CONCEPT THAT underlies capitalism, free enterprise is the economic system based on private rather than public ownership of the means of production. Investment of capital and employment of labor generate personal profit, which benefits society. According to free enterprise theorists and advocates, economies work best when left free to respond to fluctuations in supply and demand, and government intervention should be limited if not eliminated.

The theory is primarily the work of Adam Smith, who wrote *The Wealth of Nations* in 1776 as a reaction to the then-current philosophy of mercantilism. The profit motive that drives free enterprise has been present in virtually all economies, but its fullest expression came in the 18th century when the Industrial Revolution shifted power to merchants, bankers, and industrialists (sometimes known as the bourgeoisie or middle class) from the traditional landowning elites. The transfer of power came first in Great Britain and it came in all spheres—politics, economics, and society. Free enterprise, in practice, has always required some restraints by government; it does tend toward abuses, including slavery (Great Britain and the United States), apartheid (South Africa), fraud, and monopoly.

Free enterprise capitalism can arise in different social and political systems; it can take the form of democratic socialism, as in Scandinavia, or state-sponsored industrialization, as in South Korea and the Asian states (Malaysia and others.) It can exist under democracies as well as totalitarian regimes.

Free enterprise dominated in the United States during the Gilded Age of rapid and ruthless industrialization in the last decades of the 19th century. And it became excessive again by the 1920s, leading to government restraints after the Great Depression discredited it. The United States, since the 1930s, has provided exemptions, incentives, subsidies, and tax breaks. Other countries, such as Japan and Germany, have centrally planned industrial policies negotiated through meetings of labor, industry, and government at which agreements are negotiated about such things as interest rates and wages.

The former communist states of the late Soviet Union and its satellites shifted from socialism to some form of free market capitalism after the break

up of the Soviet Union between 1989 and 1991. China, late in the 20th century and early in the 21st, shifted its economy to at least a semblance of free enterprise.

Advocates claim that capitalism promotes the well being of all humans. They rely on such advocates as John Locke, Ludwig von Mises, and Ayn Rand. They equate free enterprise with individual freedom from crime, from government oppression, from force. Besides freedom “from,” there is freedom “to.” Freedom to do whatever each person deems to be in his or her own interest: freedom to work where one wants, buy what one wants, keep all that one makes. Freedom to do anything but force another. Free enterprise is presumed to be the source of maximization of use of infinite resources as each free person converts nature into economic goods and wealth. Production improves the environment by rearranging natural chemical elements for human well being. The division of labor allows expansion of the total knowledge by allowing each to learn more about her specialty, and this expanded knowledge benefits all individuals.

Free enterprise allows individuals to rise to their limits, and that creates a hierarchy of merit as identified by David Ricardo and Smith. Free enterprise brings best prices to the market; supply negotiates with demand. Consumer power controls free enterprise by accepting or rejecting the supply and the terms on which it is offered. Competition is benign and forces suppliers to be honest as they compete for finite consumer dollars.

### FREE ENTERPRISE AND FREEDOM

Free enterprise guarantees individual, political, social, and economic freedom. Advocates claim that the economic freedom advocated by the framers of the Constitution gave way to collectivism, with the government controlling distribution of over half the country's output. Milton Friedman wrote that this is contrary to the nation's best interests because the best way to make peoples' lives better is through private markets, and extremely limited government: free enterprise. Free of government, the economy will grow ever larger as free enterprisers seek to maximize their incomes by using their own personal property, physical or intellectual, to give the market what it wants, thereby gaining market share and profits. Economic life is an auction, an exchange in Smith's words, “by mutual consent and to mutual

advantage.” Another advantage is that the free market forces moral discipline: the capitalist has no legitimate claim to his wealth unless he also serves mankind. John D. Rockefeller’s philanthropy should have gone unnoticed because it was typical free enterprise behavior. Supposedly, the welfare state is immoral because it entitles all persons to the production of the capitalist without obligating them to earn it.

Those less enchanted with free enterprise note that the maximum expression of free enterprise, that of the 19th century, led to *laissez-faire* capitalism which meant dog-eat-dog, cutthroat competition, oppression of workers in sweatshops, government-industry collusion against organized labor, environmental degradation, and exploitation as well as endangerment of the consumer. The abuses of the system by capitalism run amok were such that the people rose in protest, as did the capitalists. Demands for restraints on the free enterprise system resulted in the progressive reforms such as

pure food laws, restrictions on exploitation of labor, and anti-monopoly laws.

Over time, the free enterprisers learned to use government to their advantage, accepting aspects of socialism for the capitalist, if not the consumer. Free enterprise generally has sounded better in theory than it proved to be in practice.

## G. D. Searle

WHEN PHARMACEUTICAL giant Monsanto bought struggling rival G. D. Searle for its NutraSweet sugar-substitute patents, it did not expect to become responsible for millions of dollars in product liability related to the Cu-7 intrauterine device (IUD) marketed by Searle in the 1970s.

Due to scares over the long-term health effects of oral contraceptives, IUDs became both popular and profitable in the early 1970s. Although no one is quite sure how IUDs prevent conception—continuous irritation to the uterus preventing fertilized eggs from implanting, is one hypothesis—devices inserted into the uterus had been used since at least the mid-19th century. Each IUD innovation proved to cause serious fertility and health problems, culminating in the Dalkon Shield disaster, after which Searle competitor A. H. Robins declared bankruptcy to minimize product liability claims against it.

Initially, it seemed that Searle had learned from Robins' mistakes. The Cu-7 IUD, so named because it resembled a number 7 wrapped in copper (atomic symbol Cu), was the first IUD to receive premarketing approval from the U.S. Food and Drug Administration (FDA). The IUD was classified as a drug, rather than as a less-regulated device, because part of its contraceptive effectiveness was believed to come from leaching copper into the womb. Ap-

proved in 1974, the Cu-7 was, like the Dalkon Shield, marketed as a safe contraceptive for both multiparous women (those who had borne children) and nulliparous women (those who had never given birth and who therefore had smaller uteruses). During its 12 years on the U.S. market, the Cu-7 reputedly earned Searle more than \$80 million in profits.

On January 31, 1986, Searle announced that it would halt Cu-7 sales in the United States. Planned Parenthood president Fay Wattleton told the Washington Post that she was "dismayed," as her organization had recently reaffirmed its support for IUDs as a safe form of contraception. Women wearing the Cu-7 and another Searle IUD, the Tatum-T, were told there was no reason to have their IUDs removed before their scheduled replacement date. (Searle, unlike Robins, had recommended replacement every three years.)

Two years later, internal Searle documents unsealed at a Minneapolis, Minnesota, trial convinced a jury that company officials had known the Cu-7 was unsafe. Among the evidence was a proposed label that mentioned a "three-to-fivefold increased risk of pelvic inflammatory disease" (PID), particularly for nulliparous women and women under age 25.

PID is a known cause of infertility. By the time the label left the company for FDA approval, it no

longer mentioned the risk level nor strongly recommended against using the IUD in younger women.

Additionally, testimony and documents suggested Searle had known there were defects in the IUD's monofilament string, allowing bacteria to travel up the string to the ordinarily sterile uterus, again causing PID. Although two-thirds of the previous 13,500 Cu-7 suits had been dismissed or settled for small amounts and Searle had won 15 of the 18 that went to court, this time a jury awarded \$8.75 million to plaintiff Esther Kociemba, a nulliparous woman rendered infertile by her Cu-7. The first case to award punitive damages, this one was expected to start a torrent of successful claims against the company.

The NutraSweet business was not without legal difficulties, either. When Searle faced, in 1983, a shortage of vital ingredient L-phenylalanine, it persuaded other firms to invest in production capacity. Two years later, Searle declined to renew its contracts with Purification Engineering and Genex. Genex sued for \$40 million, alleging fraud and racketeering, as it had built a facility to meet Searle's long-term needs. The suit was settled for a nominal amount.

In 1986, Senator Howard Metzenbaum (D-OH) called for investigation of whether Searle had presented incomplete and misleading data to the FDA when seeking approval of aspartame, the generic form of NutraSweet. Some studies suggest the sugar substitute causes brain tumors. Metzenbaum referred to the findings of a 1975 task force that examined Searle's handling of aspartame and blood pressure medicine Aldactone. That task force concluded that data submitted by Searle to the FDA was unreliable. NutraSweet remains a popular artificial sweetener.

## gambling and lotteries

SECOND TO THE ILLEGAL trade in drugs, gambling and its ancillary crimes are a major source of income for organized-crime operations, which often spill over into white-collar crime. Organized-crime enterprises, from La Cosa Nostra to the Yakuza, rely heavily on gambling as a core operation, producing revenue on an ongoing basis.

The gambling operations lead to other aspects of their enterprise, such as loan-sharking and extortion. Gambling is best described as the opportunity to wager on some action in anticipation of correctly selecting the winner and receiving compensation in return.

Illegal gambling may exist in many forms and formats but is described by the United States Government in Title 18, U.S.C. Sec. 1955 as a business that: 1) is a violation of the law in the state in which it is conducted; 2) involves five or more persons who conduct, finance, manage, supervise, direct, or own all or part of such business; and 3) has been or remains in substantially continuous operation for a period in excess of 30 days, or has gross revenues of \$2,000 in any single day.

The introduction of legal gambling opportunities (casinos, state lotteries, video poker, internet gambling, and legal sports betting) has not dried up the demand for illegal gambling operations. The continued success of illegal gambling operations may be due to the convenience factor, the higher odds, the absence of reporting to the Internal Revenue Service (IRS), the availability of credit, and the number of sporting events on which bets can be placed.

Proceeds from illegal gambling have in the past been associated with public corruption. In many cases public law enforcement officials have accepted payments from illegal gambling groups to operate. Recently, the governor of Louisiana was convicted on federal charges concerning corruption, some re-

lated to gambling. Some of the common operations are described below.

## LOTTERIES

The involvement of organized crime in gambling and lottery operations dates back to the early years of America during colonial days. A private lottery passed by Congress in 1823 for a beautification campaign in Washington, D.C., was never paid out when the organizers fled with the proceeds. As more and more states outlawed lotteries in the 1800s, smugglers began transporting tickets from legal states to outlawed states where the demand was still present.

The Louisiana lottery was an example of the fraudulent underpinnings of the lottery system. It was discovered that the lottery syndicate operating the state lottery was actually a criminal syndicate from New York, which had skimmed winnings off ticket purchases and had paid multiple bribes to state legislators to maintain their state contract. Other state lotteries were exposed for fraudulent activities, such as a New York lottery manager who promised to pull certain tickets so they could not win, and the fact that he “owned” a percentage of any winning ticket.

With the eventual prohibition of state lotteries, illegal lotteries began to appear. Eventually, public lotteries reappeared as funding devices for states, but in the interim, organized crime created the numbers or policy racket to satisfy the appetite of gamblers who either desired the action gambling provided or the chance to cash in. Organized crime has attempted to remain in the legal lottery business by attempting to enter the business of supplying lottery terminal and affiliated services to state governments.

## NUMBERS RACKET

The numbers or policy racket grew out of the lottery games; due to the ever-increasing cost of tickets. Some tickets prices were topping \$60 in times when annual incomes seldom reached \$1,000. Policy betting allowed poorer people to participate in the game by allowing the purchases of tickets by selecting particular numbers that would be picked in the lottery on any given day. The game was not connected with the lottery and the winnings were determined on the number of bets made.

The lottery industry attempted to maintain pace with the policy games, but more bettors preferred the policy game, where drawings could be observed daily and runners came by to pay off bets. In the 1920s, the numbers racket took form, starting as a game in which a three-digit number (000–999) was selected as the winner; with the number originally being the last three digits of the daily U.S. Treasury Balance, attendance at the local track, stock market sales for the day—any number that could be viewed by large numbers of people and a number that allegedly could not be tampered with. The game thrived in poorer communities and eventually organized crime saw the value of the game. Dutch Schultz took over the numbers/policy racket in Harlem, New York City, in the 1920s while Al Capone financed much of the numbers racket in Chicago, Illinois.

The numbers racket is still viable in many U.S. cities with most operations being run out of legitimate businesses, including bars, newspaper stands, and small retail shops. The Charleston, South Carolina, police estimate that several suspected numbers games in their city take in at least \$60,000 each daily, sometimes using the legal state lottery numbers as their winning numbers. Some research has alleged that the revenue generated from illegal number operations exceeds the amount of revenue generated by state operated lotteries.

The game is organized so that persons taking the bets can “layoff” (sell or trade certain blocks of tickets) to other betting operations if one number is being selected out of proportion to the other numbers. As with most organized criminal enterprises, there is a specialization of positions within the numbers operation, that is, runners who collect bets and make payoffs, bankers who handle the cash, and operators who make sure that the operation runs smoothly, sometimes through bribes to local officials.

## BOOKMAKING/SPORTS BETTING

Bookmaking often refers to the acceptance of bets on sporting events, which is generally understood to be illegal except in some licensed casinos. Illegal sports betting operations, referred to as bookies or bookmaking, will accept wagers on most sporting events, including professional and collegiate football, basketball, baseball, as well as horse races, tennis matches, and almost any athletic event.

A gambler wagers a bet through her bookie, placing either single bets (selecting a certain time to win or lose) or placing a series of bets (parleys, “if bets,” secondary bets contingent on outcome of first bet, for example, scores at the end of certain periods in a game, etc.). Often bets are made on the outcome of the game (who won or loss) but by how many points, or the point spread. If the bettor wins she is paid the amount she wagered; if the bettor loses she owes the amount wagered plus 10 percent.

Illegal bookmaking has often raised allegations of games or races being fixed, in which players are instructed to shave (reduce the number of points they normally score) points, or throw (intentionally lose the game) the game. The advance knowledge of the final outcome of a sporting event, not the exact score necessarily, but who would win and how close the margin would be, allows bettors or bookies to wager differently on those games. These types of allegations have existed throughout sporting history as noted by the 1919 Black Sox Scandal in which several Chicago White Sox players allegedly accepted money to influence their play.

College basketball scandals occurred at both Boston College and Tulane University, with allegations of point-shaving at both colleges. Pete Rose, formerly of the Cincinnati Reds Major League Baseball (MLB) team was banned from involvement in MLB for life due to his involvement in placing illegal bets of MLB games, which he admitted to in 2004. One concern for illegal sports-betting analysts is that players who owe sums of money to those illegal operations may throw games to help reduce their debts, either by betting against themselves or by agreeing to throw the game for a third party.

Illegal bookmaking operations are found in almost all major U.S. cities, with most being completely operated or funded by organized criminal enterprises. The involvement of organized crime is sometimes needed in illegal bookmaking operations to “lay off” bets, a situation in which too much money is being wagered on a certain outcome (Team A to beat Team B). If the operator accepts all those bets on Team A and the team wins, he will not be able to pay all the winners. Through the use of a lay off, the excess wagers on Team A are traded/sold to another bookmaking operation, who may be experiencing an increase of bets on Team B.

One of the conveniences of illegal bookmaking is the ability to play on credit, not having to pay

until after the game. This convenience often leads to another negative aspect of illegal gambling: loan sharking. In some criminal enterprises, the focus is the profits generated by loan-sharking not from the bookmaking operation.

#### LOAN SHARKING

Organized criminal operations will loan funds to bettors who may not necessarily be able to secure other funding, especially if the purpose of the money is to gamble. However, the interest rates charged by organized crime operations are generally usurious, many times higher than the amount allowed by law. In some cases, bettors can barely afford the weekly interest, often called the vig or the nut, which sometimes approaches 20 percent weekly, with the principal never being reduced. Organized crime operations may sometimes utilize violence to collect the funds or proceed to secure payments in other manners: taking ownership in the bettor’s business, obtaining confidential information the bettor may have access to (police records, alarm codes, shipping information, inside stock information, etc.) or securing the bettor’s involvement in a criminal event (throwing a sporting event, assist in drug trafficking, or being a collusive victim in a crime such as a staged robbery).

#### PRIVATE CLUBS

In some areas, gambling operations are run as private clubs in which there is no state oversight, as the “house” operates the club, controls the odds, the payouts, and the legitimacy of the games. These private clubs offer the same games of chance as do legal casinos, but often these clubs involve high stakes games that attract players who prefer their anonymity or the fact that no taxes are paid on the winnings.

Additionally, these clubs may offer courtesies not generally available at legal casinos: extended credit, no-limit betting, drugs, and prostitution. In the early days of gambling some clubs may have been involved in “rigging” (affecting the outcome of a game of chance), but most operations now focus on the profits made from the operations from interest on loans, sale of drugs, and repeat visits by high-cash players. The house “takes a cut” (receives a percentage of each card hand played, for example) of all the gambling action. Similar to the speakeasy

days of Prohibition, patrons do not see themselves as criminal and may not understand the connection between the club and organized crime.

### CASINOS

As seen in many organized-crime movies, casino operations were heavily impacted by organized crime. The creation of Las Vegas, Nevada, provided organized crime an operation by which money could both be made and laundered (providing a source of origin for the proceeds generated through illegal operations). With years of experience in the gambling industry, large amounts of working capital, and loyal (to the operation) workers, organized crime was able to establish a foothold in the casinos of Las Vegas.

Due to tremendous amount of cash that passed through casinos, organized crime groups were able to skim, removing money from the daily receipts before it was entered into the accounting ledgers) and yielding large amounts of tax-free money. Additionally, through the use of labor extortion, physical violence, and blackmail, organized criminal operations were able to impact non-gambling aspects of casino operations, including hotel/casino line employees, linen and food delivery, construction, and financing. Through the use of bribes and other methods, organized criminal operations were able to conduct other activities (prostitution, drugs, loan sharking) at the casinos. In some cases, covert operations would be conducted against non-affiliated casinos, such as setting up rigged games, thefts, labor strife, and vandalism.

Organized crime influence is not confined to Las Vegas casinos, as has been noted in several licensure hearings of non-Nevada casinos. Casino hearings in Illinois, Louisiana, Minnesota, and Missouri have disclosed the presence of organized crime members in the "management" groups attempting to secure casino permits. The Senate Select Committee on Indian Affairs similarly noted several attempts by persons with organized-crime ties trying to gain influence in Indian casino operations.

### INTERNET/OFFSHORE GAMBLING

Internet gambling has provided bettors the opportunity to place bets through computers, bypassing domestic anti-gambling laws, as the bets are processed through offshore accounts. Persons with internet access and a valid credit card account num-

ber can wager on multiple games of chance and sporting events. Since the operations are not regulated normally, no dollar limits exist, other than the amount of credit available on the bettor's credit card. This gambling type is just as addictive as other types of betting, and some reports indicate that it may be more addictive. In March 2003, a former executive and president of Conbraco, Inc., pled guilty to wire and bank fraud charges which resulted form an attempt to cover \$31 million in internet gambling losses in a one-year period. The betting transactions are processed through credit cards, and some of the processors are organized crime operations that then compromise the credit of bettors.

### HORSERACING, PARIMUTUEL BETTING

While the numbers racket is assumed to generate large amounts of illegal profits for organized crime operations, it relies on a multitude of transactions as the price per ticket is low. Gambling on horses however, can produce large amounts of revenue on a limited number of bets. To generate the large amount of daily legal bets that the horseracing industry needs to remain profitable, parimutuel betting was developed. Parimutuel betting is a process by which all bets on all horses are recorded at the time the ticket is printed, that is, the bet is made; and the payoff odds as well as the amounts that can be paid-out are determined.

Betting on horseraces was further supplemented by the acceptance of off-track-betting, betting that does not require the bettor to physically be at the racetrack in question. Racetracks, in an attempt to attract patrons physically to the racetrack, have introduced video poker machines, gambling devices that allow bettors to replicate the motions of playing poker at casinos. Betting on horseracing has sometimes been impacted by organized crime's attempts to fix races (controlling the outcome of a race). Races have been fixed through various methods, including: medication of horses, bribes to jockeys, substitution of horses, and threats of violence. Other crimes that link gambling and organized crime include insurance fraud through the murders of highly insured horses.

### VIDEO POKER

Some states have legalized gaming (a newer, more innocent term for legalized gambling) in their jurisdic-

tions as a tax-generation device, ranging from casinos to video poker terminals in convenience stores. The terminals are leased from licensed supply companies and installed in various businesses: bars, restaurants, and liquors retailers. The video poker terminals allow bettors to play electronic poker hands against the terminal. The integrity of the game is guaranteed by a state agency, charged also with approving licenses for owners, operators, and financial sources for the supply companies. In some cases, organized crime groups have been able to obtain licenses and enter the business. Once licensed, these groups sometime pressure potential customers to use their terminals and not those of the competition. Some instances have been found where terminals had been tampered with, to allow for the winning hands to be pre-determined.

## Geis, Gilbert (1925–)

THE PUBLICATION of “The Heavy Electric Equipment Antitrust Case of 1961,” authored by Gilbert Geis, engendered future generations to the study of white-collar crime. The price-fixing case, first published in 1967 in Marshall Clinard’s and Richard Quinney’s *Criminal Behavior Systems: A Typology*, represented a significant landmark in explo-

rations of deviant corporate practices during a time period in which academic interests in white-collar crime had become somewhat complacent. The conduct of some corporate officials, including high-ranking General Electric and Westinghouse Electric executives, was accurately characterized by Geis as flagrant criminal offenses that violated the Sherman Antitrust Act of 1890. The research illustrated corporate crime by numerous individuals who participated in a price-fixing conspiracy.

Ultimately, grand juries issued 20 indictments for 45 persons and 29 corporations. The majority of defendants entered a guilty plea resulting in fines of almost \$2 million and seven convictions with jail terms of 30 days, with time off for good behavior. Geis takes note of the lenient sanctions afforded the offenders: for GE a half-million-dollar loss was no more punitive than a \$3 parking fine to a person with an annual income of \$175,000. The case study methodology offered insights into the specific nature, techniques, and offender characteristics involved in widespread corporate deviance that supported and refuted many of the observations and insights first offered by white-collar crime pioneer Edwin H. Sutherland.

Geis, considered one of the most influential white-collar-crime scholars since Sutherland, was born in New York City. He was raised in Brooklyn by his mother and grandmother and partially credits his interest in criminology to the latter’s fervor for dime crime magazines. Note might be made also that his grandmother, a Polish immigrant, supported the family during the Depression by manufacturing bootleg liquor that was marketed through the Dutch Schultz gang. After a short stint in the U.S. Navy as a radioman second class and first-class ping-pong player during World War II, Geis continued his education at Colgate University.

From 1946 to 1948 he worked as a reporter for the *Times* in Hartford, Connecticut, and then the *Daily Home News* in New Brunswick, New Jersey. He received his Master’s degree from Brigham Young University in 1949 and his Ph.D. from the University of Wisconsin, Madison, in 1953. He recalls first reading Sutherland’s *White Collar Crime* in 1952 during his tenure in the department of sociology at the University of Oklahoma.

He describes these five years as an uneasy exile in uncharted geographical and academic territories that required him to teach courses in criminology and race relations, though his majors had been Eng-

lish and journalism. His little-known mystery novel about a rape on a college campus, *Fury on Legs*, was written during the summer while he was teaching at Adams State College in Alamosa, Colorado. In 1957, he left Oklahoma to teach at California State University, Los Angeles. He then joined the school of social ecology at the University of California, Irvine, in 1971 and became a professor emeritus in 1987.

The breadth and depth of Geis's academic career is legendary. He has published more than 384 journal articles and books dealing with a whole host of topics: juvenile delinquency, victimless crime, witches, corrections, racism, courts, death penalty, courtship, policing, victimization, rape, gangs, Leopold and Loeb, Charles Manson, and O.J. Simpson, to name a few. Geis's first white-collar publication in 1962 grappled with the delineation of white-collar crime offenses, and since 1967, he has explored numerous subjects in the area, including deterrence in corporate crime, victimization patterns, theoretical explanations, medical and health-care fraud, perceptions of seriousness, and sanctions.

Geis has been the recipient of many awards, including, for example, the Edwin H. Sutherland Award for Outstanding Contributions, the Donald R. Cressey Award for Excellence in Fraud Detection and Deterrence, and scores of outstanding and distinguished professor awards. He has served as president for the American Society of Criminology, president of the Institute for Financial Crime Prevention, chair of the subcommittee on white-collar crime for the American Bar Association, and member of the advisory committee for the National White-Collar Crime Center.

## gender discrimination

SEXISM IS AN IDEOLOGY that suggests one sex is inherently superior to the other. Such beliefs support gender prejudice (attitudes) and gender discrimination (actions that perpetuate differences in hiring, promotion, and pay). Sex discrimination exists in various forms, and women aren't always the victims: about 10 percent of complaints filed come from men.

Sex discrimination occurs when people are treated differently because of their gender. Examples of discrimination can involve pay disparity, hiring and firing, promotions, sexual harassment, and pregnancy.

Equality for American women made significant gains in the latter part of the 20th century, including legal pressure for equal pay for comparable work, greater access to traditionally male dominated jobs, and changes in the law to discourage sexual harassment. Men have also benefited from these laws. The following laws have reduced discrimination based on sex:

The 1963 Equal Pay Act (EPA) protects men and women performing essentially equal work in the same establishment from wage-based discrimination. The EPA covers all employers who are covered by the Federal Wage and Hour Law (the Fair Labor Standards Act). Virtually all employers are subject to the provisions of this act.

Title VII of the Civil Rights Act of 1964 prohibits employment discrimination based on race, color, religion, sex, or national origin. Title VII covers all private employers, state and local governments, and education institutions that employ 15 or more individuals. These laws also cover private and public employment agencies, labor organizations, and joint labor management committees controlling trade apprenticeship and training. The Civil Rights Act of 1991 provides monetary damages in cases of intentional employment discrimination.

The U.S. Equal Employment Opportunity Commission (EEOC) is in charge of enforcing

many of these laws. EEOC also provides oversight and coordination of all federal equal employment opportunity regulations, practices, and policies. Legally, it is up to employers to stop sex discrimination, explains Brad Seligman, anti-discrimination attorney. "Under federal law, there is no liability for a supervisor who discriminates, but a supervisor's conduct results in the employer being responsible. The buck stops with the employer. As a practical matter, employers who don't control discrimination in their workplace can face draconian consequences." The sex discrimination suits Seligman has pursued "have netted victims \$107 million from the Lucky store chain and \$250 million from State Farm Insurance."

Any individual who believes that his or her employment rights have been violated may file a charge of discrimination with EEOC. In addition, an individual, organization, or agency may file a charge on behalf of another person in order to protect the aggrieved person's identity. The "relief" or remedies available for employment discrimination, whether caused by intentional acts or by practices that have a discriminatory effect, may include: back pay, hir-

*Gender discrimination against women may involve hiring and firing, promotions, sexual harassment, and pregnancy.*

ing, promotion, reinstatement, front pay, reasonable accommodation, or other actions that will make an individual "whole" (in the condition he would have been but for the discrimination). Remedies may include payment of attorneys' fees, expert witness fees, and court costs.

Under most EEOC-enforced laws, compensatory and punitive damages also may be available where intentional discrimination is found. Damages may be available to compensate for actual monetary losses, for future monetary losses, and for mental anguish and inconvenience. Punitive damages also may be available if an employer acted with malice or reckless indifference. Punitive damages are not available against the federal, state or local governments. More than 20,000 sex discrimination complaints per year were filed with the EEOC during the 1990s, not including charges made to state governments. Damages awarded through the EEOC totaled \$81 million in 1999.

## General Dynamics

GENERAL DYNAMICS Corporation, a St. Louis, Missouri-based defense contractor, is alleged to have defrauded the U.S. government by inflating costs, understating profits, and committing contract fraud by offering kickbacks in connection with a 1970s-era shipbuilding contract.

In 1985, government prosecutors charged the firm with criminal fraud stemming from early development work for a U.S. Army air-defense gun system, known as the Division Air Defense weapon (Divad). The allegations combined to make General

Dynamics into a symbol of the problems with military procurement.

In the late 1970s, the U.S. government offered a subsidy program to make American companies more competitive with foreign shipbuilders. The government later claimed that Quincy Shipbuilding division of General Dynamics fabricated an estimate that was designed solely for the purpose of winning an \$80 million subsidy. The subsidy allowed a profit of only 10 percent on the ships, but General Dynamics' actual profit was about three times that amount.

The government complaint, brought against the contractor in 1987, charged that the firm kept two sets of books for the building of the ships, which were used to carry liquefied natural gas. One set of books accurately portrayed the company's costs and profit projections. But the other set of books were based on widely inflated costs, misleading estimates and illegal kickbacks received by General Dynamic's officials for subcontracting work. General Dynamics, however, claimed that it was being penalized for setting overly optimistic goals for its work on the ships.

The company insisted that the supposedly secret set of books were merely estimates for an operating plan, and not hard figures reflecting costs and profits on the ships.

In 1991, the federal government attempted to recover \$240 million by suing General Dynamics and four of its employees in a New York federal court. The sum included the \$80 million subsidy as well as an additional \$160 million in penalties. The government alleged that the kickbacks had inflated the amount of subsidies by \$7 million. The Department of Justice later dropped the suit. In 1996, the government was ordered to pay the firm \$25 million for legal fees incurred during the pursuit of the case.

General Dynamics is also alleged to have committed fraud in the 1980s by illegally billing the Pentagon for cost overruns related to the \$5 billion Divad project. General Dynamics was briefly barred from bidding on defense contracts as a result of the charges. Under the direction of Defense Secretary Caspar Weinberger, the navy ended General Dynamic's suspension from new government contracts in 1986, and stirred controversy by promising that the government would never again suspend the company for any subsequent indictments involving its earlier activities. Generally, an indictment brings

an automatic suspension from new contracts. The criminal action was subsequently withdrawn by the Justice Department.

## General Electric

GENERAL ELECTRIC (GE) is a massive multinational conglomerate, with 107 factories in the United States and 103 overseas plants in 23 foreign nations. It employs 243,000 American workers and has about 500,000 stockholders. About 300 major retail stores use its credit card system, and its NBC television network has about 200 affiliate stations in the United States.

General Electric is the third-largest defense contractor, and the nation's second-largest plastics manufacturer, the owner of RCA, has its own cable television network, and is a stockbroker (it owns Kidder Peabody). Moreover, it has its own bank, GE Capital, which has \$91 billion in assets. General Electric is also among the most lawless of American corporations. For example:

1957–61. GE was convicted of price-fixing and other charges for electrical equipment valued at \$1.74 billion per year, the largest price-fixing case in the history of the Sherman Antitrust Act to that time.

1988. GE was indicted on 317 counts of fraud in connection with a scheme to defraud the U.S. Army of \$21 million on a logistics computer contract.

Indeed, GE has a very long history of corporate crime. Other examples include:

1981. GE was convicted of paying a \$1.25 million bribe to a Puerto Rican official to obtain an electrical plant contract. Three GE executives were imprisoned in the case.

1986. GE officials at a machine tool company were charged with providing kickbacks to three former GE purchasing employees to obtain Pentagon subcontracts.

1987. It was exposed that GE supplied thousands of defective military and civilians airplane engines to customers. The defects included cracks in tubing and brackets in the F-404 engine used in the F-18 Navy fighter, the T-700 helicopter, and the CT-7 for small commuter planes .

GE's stock brokerage firm, Kidder Peabody, paid \$25.3 million to settle an insider-trading complaint with the Securities and Exchange Commission (SEC). GE Capital paid a \$275,000 civil penalty in 1989 for discriminating against low-income consumers, the largest fine ever under the Equal Credit Opportunity Act. GE paid a \$32 million settlement to women and minorities in an employment discrimination case, and its Canadian subsidiary was convicted (along with Westinghouse and other firms) of conspiring to fix prices on light bulbs.

GE is also a major environmental polluter. Four of its factories are on the Environmental Protection Agency's (EPA) list of the most dangerous industrial sources of toxic air pollution, and GE has been identified as responsible for contributing to the damage of 47 sites in need of environmental clean up. The company has also paid tens of millions of dollars in out-of-court settlements for its toxic dumping of chemicals.

In the early 1990s, problems including bribery and mis-pricing became so pervasive that the Pentagon's Defense Contract Management Agency took the unique step of setting up a special investigations office just for GE. The office secured 22 criminal indictments against the company, its sub-contractors and employees, and recovered \$221.7 million in fines and settlements.

Between 1990 and 2002, GE has been involved in 63 cases brought by the federal government against it, and has settled claims for \$982.9 million, more than any other corporation in America.

If GE were an individual, it would be considered an habitual criminal under American law. Instead, it tries to undo laws and cultivate a favorable public image by engaging in a host of image-making

and philanthropic activities, including scholarships for poor and minority college students and donations to the United Way. Even charitable contributions further GE's political and economic aims. Some of GE's tax-exempt contributions go to Chris Walker's American Council for Capital Formation (an "educational" front group that campaigns against the corporate income tax and for a national sales tax), the Institute for International Economics (a think tank promoting pro-corporate positions on economic policy and trade), and Americans for Generational Equity (which campaigns for issues like reducing Social Security entitlements).

GE also funds other causes promoting political socialization and propaganda, including membership in the Business Roundtable, whose policy-formation activities disseminate the views of the largest 500 American corporations.

## General Motors

WHEN DRIVERS and passengers enter automobiles, they want to believe that the manufacturer of that particular vehicle has made it as safe as possible. They know their lives might depend on safety measures such as seat restraints, air bags, shatter-proof windshields, and flexible steering wheels. Few drivers even consider that the way in which a car is designed may save their lives. General Motors (GM) makes billions of dollars a year by selling vehicles, and most consumers trust these purchases.

However, before the consumer movement of the 1960s, GM, like other automobile manufactur-

ers, allowed increased profits to take precedence over consumer safety. Even after federal law forced manufacturer responsibility on the automobile industry, design flaws continued to surface, albeit with less frequency.

The driving force behind the move toward greater automobile manufacturer responsibility began in the 1960s when a young, inexperienced lawyer took on the automobile industry, and changed that industry forever. In 1965, Ralph Nader targeted General Motors in his book, *Unsafe at Any Speed*, which the *San Francisco Chronicle* called the *Silent Spring* (invoking Rachel Carson's groundbreaking environmental work) of the automobile industry. Evidently, GM retaliated by trying to discredit Nader. GM allegedly resorted to setting up seduction schemes that were intended to provide grounds for blackmail. When that failed, GM responded by hiring two detectives to follow Nader around hoping to catch him in some wrongdoing.

Nader responded by suing General Motors for invasion of privacy and emotional distress. He used the \$424,000 settlement from *Ralph Nader v. General Motors* to establish a consumer group that provided "continuous legal monitoring" of the automobile giant. The press had a field day with the coverage, and GM's admission of guilt made the front page of newspapers around the country. A Senate subcommittee forced the president of General Motors to apologize for the behavior.

In *Unsafe at Any Speed*, Nader pointed out that based on 1965 predictions by the Department of Commerce, 51,000 people would die in automobile accidents in the United States within the next 10 years. Nader set out to investigate particular automobiles that were contributing to the high number of fatalities, and to discover ways to make automobiles as safe as possible. Nader's investigations revealed that the automobile industry was concerned with profits even when company executives were aware that consumers were at risk.

#### THE CHEVROLET CORVAIR

For example, in a keynote speech before the National Safety Congress on October 17, 1961, John F. Gordon, the head of General Motors, insisted that only "amateur engineers" believed the unrealistic idea that automobiles could be made "virtually foolproof and crashproof." At the time that Gordon was ridiculing the notion of safer automobiles,

GM had already paid \$70,000 to Rose Pierini who had filed suit against the company after losing an arm when her 1961 Chevrolet Corvair went out of control and turned over.

Investigators in Pierini's case tried to determine why the Corvair went out of control instead of automatically placing the guilt on Pierini, as had been done in earlier accidents. A witness who had been going in the opposite direction testified in court that Pierini was obeying the speed limit of 35 per hour when her car suddenly veered to the right before turning over. An observant police officer noticed that her tires had made gauge marks, and that the left rear tire was completely deflated, a pattern he had seen in other automobile accidents involving the Chevrolet Corvair. As subsequent information on the Corvair surfaced, it was revealed that law officers around the country had also observed a number of accidents involving the Corvair, all with the patterns similar to those in the Pierini case.

During the Pierini trial, the Chevrolet dealer from whom Pierini purchased her car testified that he sold an accessory that could be attached underneath the Corvair to prevent the caving in or tuck-under that often occurred when the vehicle's rear wheels were put under stress during cornering. It developed that General Motors had manufactured a 696 option that could be sold to Corvair purchasers who were knowledgeable enough to request it. The purpose of the option was to stabilize the rear end with heavier suspension springs, shock absorbers, and a front-end stabilizing bar. Testimony revealed that because of high demand for corrective measures on the Corvair, dealers did not always receive safety parts that were ordered from General Motors.

Within the next few years, over a hundred more lawsuits were filed by owners of 1960 to 1963 models of Corvair, involving millions of dollars in damages. GM consistently blamed bad driving for the accidents and refused to acknowledge any responsibility for a faulty design. As more information surfaced, it became clear that a number of people, including competitors, had known about the problems with the Corvair before accidents started to happen. For example, in 1959, when two test drivers for Ford tried the Corvair, both drivers lost control and crashed. Confidential papers distributed among GM executives revealed that the company was well aware that tuck-under could occur in the Corvair with no warning if a tire skidded side-

ways, was assailed by crosswinds, or when navigating S-curves.

The U.S. Congress passed the National Traffic and Motor Vehicle Safety Act in 1966, mandating the incorporation of safety devices that were designed to prevent as many fatalities as possible in automobile accidents. The act also established the National Highway Traffic Safety Administration (NHTSA) under the Department of Transportation to oversee safety and consumer programs, including motor-vehicle crash testing and automotive recalls. From 1966 to 1972, the death rate from automobile accidents declined an average of 3.5 percent a year.

In *Larsen v. GM* in 1968, the court agreed that GM should have been able to predict that cars were likely to be involved in collisions and should have allowed for that possibility in the design of its vehicles. Larson was one of a number of Corvair drivers who had been injured when his steering wheel became displaced during an accident, causing extensive head damage from the steering wheel rather than from the crash.

#### OTHER DEFECTIVE PRODUCTS

Even in the midst of a number of high-profile lawsuits against General Motors, the company continued to measure customer safety according to a cost-benefit analysis. While the company admitted that customers should not be used as guinea pigs to test various GM designs, executives bemoaned the fact that the automobile industry should still police itself.

This kind of reasoning was evident in a 1979 lawsuit in which General Motors was forced to pay a \$4.9 billion settlement in a lawsuit in which six people had been horribly burned in a rear-end collision of a Chevrolet Malibu. Testimony revealed that GM executives had determined that it was cheaper to settle lawsuits than to change the design of the vehicle.

In the course of various lawsuits, information also surfaced that doors in GM cars were more likely to be torn off during accidents than in cars made by either Ford or Chrysler. Lawsuits were also filed over ignition switches that stuck. GM was taken to task for windshields that shattered during crashes and for instrument panels that turned into deadly weapons when GM cars were involved in crashes. Even after other automobile companies made seatbelts standard equipment, GM had opposed them,

arguing that they only made drivers aware of their own mortality.

A number of successful lawsuits against GM in the 1980s forced the company to discontinue a faulty windshield design that had caused problems with safety restraints. Suits in Arizona and Illinois in the 1990s that involved collapsing seatbelts forced GM to establish more realistic seatbelt standards. In a Georgia case in 1991, GM was sued when the fuel tank of a pickup caught fire after a collision. A GM consultant testified in court that the design of the fuel tank was faulty. A successful lawsuit in Alabama in 1996 resulted in corrections to the design of GM Type III door latch.

The litany of defects, sometimes fatal, continued unabated through the turn of the century as truck-based sport-utility vehicles (SUVs) captured the market, introducing widespread roll-over accidents. The lawsuits continued as well.

## Georgia-Pacific

WHILE GEORGIA-Pacific Corporation's 1991 fine for tax evasion set an Atlanta, Georgia, record for corporate criminal penalties, its use of asbestos posed larger problems for this forest products company and its former customers. In October 1991, Georgia-Pacific pled guilty to tax evasion, promising to pay \$21 million in fines and back taxes.

In 1984, the company had claimed a \$24 million charitable contribution when it donated the 5,360-

acre Santa Fe, New Mexico, swamp to the Suwannee River Water Management District. The value of the land was approximately \$2 million.

More significant is the sum of \$181 million that Georgia-Pacific paid for asbestos-related litigation in 2002. An investigative series by the company's hometown newspaper, the *Atlanta Journal and Constitution*, revealed that, although the company knew by 1970 about the dangers of asbestos in its popular Ready-Mix joint compound, it kept the product on the market until 1977. Asbestos, a long-fibered mineral, was essential to the compound's ability to cling to drywall. When an asbestos-free version failed to sell in 1973, Georgia-Pacific put the original version back on the market.

The dangers of asbestos had been known within the industry, though concealed from federal regulators, since the 1940s. In the early 1970s, the Occupational Safety and Health Administration (OSHA) began to demand that factories like Georgia-Pacific's dusty Akron, New York, Ready-Mix plant add ventilation and other protections for workers. In 1973, a study showed that construction workers were also at risk from asbestos. These risks were shared by home do-it-yourself remodelers as well.

The most dramatic health hazard from asbestos exposure is malignant mesothelioma, a rare cancer that attacks the lining of the lungs and heart. Initial symptoms, explains the Mesothelioma Network, may be similar to pneumonia. The *Journal and Constitution* notes that Lisa Pransky, who obtained a \$9 million judgment from Georgia-Pacific, died within three years of diagnosis despite aggressive treatment. Like many victims, Pransky did not show symptoms until 25 years after exposure to asbestos in the Ready-Mix her father used in remodeling the family home.

More than 314,000 asbestos-related claims had been filed against Georgia-Pacific by 2002, with another 29,500 in the first quarter of 2003. The company's appeal as a legal target increased as other asbestos-using firms have avoided settlements by declaring bankruptcy. In late 2002, the company's credit rating slid toward "junk bond" status. In 2003, Georgia-Pacific confirmed rumors that it intended to shelter its other operations from liability.

## Germany

WHEN THE Deutsche Reich (German Empire) was created at Versailles near Paris, France, in 1871, a period of economic boom followed, which was called *Gruenderjahre* (founding years). Although business scandals riddled this period, business crime as a major public issue arose only during World War I, when *Kriegsgewinnler* (profiteers of war) became an issue.

The rise of Nazism was closely linked to business interests by great landowners and big business alike. Whereas the agrarian lobby searched for public funds to pay for their immense debts, German industrialists, especially from the heavy-industry Ruhr area supported Adolf Hitler financially to get rid of socialists, unionists, and communists. This alliance formed in the late 1920s and 1930s led to an organized circle of the industrial friends of the SS secret police, and the building of factories to be staffed by concentration-camp inmates.

The SS was not only an instrument of terror, but also an economic entity. The military occupation of most of continental Europe was always followed by economic plunder on a large scale: gold and foreign currency taken from the national banks of the occupied countries, transfer of art treasures to German museums or collections of high-ranking Nazi officials, gaining control and/or expropriation of industries in the occupied countries by German trusts.

The Nazi extermination measures used against the Jews are interpreted by some historians not only

as racial genocide, but as an operation of theft and robbery of a unknown scale accompanied by mass murder.

#### POST-NAZI BUSINESS CRIME

After the collapse of Nazi Germany, the Allies investigated business involvement in mass murder and even brought some industrialists to trial in Nuremberg. In the Soviet-occupied zone of Germany, the problem was tackled by expropriation of land and industry on a large scale. The Americans with the Financial Investigation Section of the Finance Division of the Office of Military Government did detailed reports into German banks and industries and their involvement in Nazi and war crimes (OMGUS reports). The Cold War ended those investigations.

During the West German *Wirtschaftswunder* (economic miracle) in the 1950s, once again busi-

*German industry and factories contended with new aspects of business crime after reunification in 1990.*

ness crime and scandal were overshadowed by rapid economic growth. The rearmament of Germany was an opportunity for many bribery affairs connected to nearly every major weapon system and building contract for the armed forces. Minister of Defense Franz Josef Strauss was associated in the public debate with many of these scandals, but actually never charged much less convicted.

Weapon sales, in general, for nearly 50 years were a major source of business crime: In the 1950s the (West) German law had many loopholes in its weaponry export regulations, which were used by dealers for trafficking World War II surplus and more modern equipment. When West Germany engaged in a more controlled export regime, deals outside the North Atlantic Treaty Organization (NATO) hemisphere became legally difficult, especially to war-ravaged regions.

Nevertheless, illegal deals never ceased. German foreign policy came under pressure from its European and U.S. allies, especially after the discovery of production units for chemical weapons supplied by German firms in Rabta (Libya) in the 1980s (called "Auschwitz-in-the-sands" by American media), and for the remains of German-made weapon industry facilities in Iraq discovered after the 1991 war. Because the foreign policy impact became untenable, the control systems against illegal weapon deals were reorganized and better staffed during the 1990s. Nevertheless, on some occasions, the political pressure on the judiciary to play down certain scandals persisted.

#### BANKING CRIME

The synonym for business crime in the banking sector in Germany is still the collapse of the Herstatt Bank in 1974. On June 26, the Bundesaufsichtsamt fuer das Kreditwesen (federal agency for the control of the banking system) ordered the closing of a private bank in the Cologne-Bonn region. The bank collapsed after foreign currency speculation failed on a large scale. The indictment for fraudulent bankruptcy against the owner, Iwan D. Herstatt, was not successful but he was convicted of the minor charge of fraudulent currency conversion. The scandal changed the German banking system forever as tougher control systems and larger emergency funds were structured.

German unions nearly collapsed during the Neue Heimat scandal in the early 1980s. The large

union-owned building company was plundered over many years by some of its employees. This affair had an impact on German politics, as the close ties between the unions and the SPD (social-democratic party) helped the CDU/CSU (conservative parties) in general elections of the 1980s. At the same time another scandal, the Flick affair, involved all major German parties. The Flick Company, which already had a legacy of close involvement with the Nazis system, financed for a long period many German parties and politicians. This was called *politische Landschaftspflege* (care for the political landscape). The payments involved violated not only German political party finance laws and taxation rules, but had, in the public view, strong links to actual bribery. When the conservative Helmut Kohl government took office in 1982, it immediately prepared an amnesty law for the crimes committed in this affair, but failed due to a public outcry. Nevertheless, most sentences were very mild. After Kohl left office in 1998, it emerged that he had maintained a system of illegal party funding for the CDU even after the Flick affair.

## ORGANIZED CRIME

Organized crime entered Germany on a larger scale only after the reunification in 1990. Organized crime in former West Germany mainly involved drug dealing and corruption of officials charged with granting building contracts or licenses. The opening to the former Eastern Bloc led to an ongoing new series of trafficking of drugs, stolen cars, and forced prostitutes. On a minor scale, cigarette smuggling was the most visible form of organized crime (with dealers prevalent in Berlin and other big cities), operated by former Vietnamese contract workers of the collapsed East German communist regime. The more important sectors of organized crime were shared and sometimes disputed by German citizens and immigrants from the former Eastern Bloc nations, Turkey, and some African states.

A special form of business crime was created by the division of Germany between 1945-49 and 1990: Western export limitations of high technology products to the East were violated on a large scale; this form of crime was in the public view closely associated with Alexander Schalck-Golodkowski, who was the person within the East German state security organization (Stasi) in charge of illegal transfers. After the reunification in 1990,

large sums of public funds were diverted from the recovery of the East German industry during the process of re-privatization.

The government agency in charge of the formerly East German state-owned industry failed to control the fraudulent use of such funds on a massive scale. This transition period culminated when the building contractor Schneider collapsed in 1994. Into the 21st century, the German judiciary is beginning to cope with business and corporate crime during the "bubble economy," of which is associated with many failed enterprises of the *neue markt* (new economy).

## Giuliani, Rudolph (1944–)

AS A YOUNG U.S. attorney in Manhattan, New York City, Rudy Giuliani was considered hard-hitting and on his way to greater things. In 1986, Giuliani became the U.S. attorney for the southern district of New York. Giuliani decided that his mission in life was to go after white-collar criminals on Wall Street in a crackdown unlike any the financial center had ever seen. While the insider-trading probe was already in progress when Giuliani came on board, he became its motivating force.

His first target was Michael Milken and his junk bond kingdom, Drexel Burnham Lambert (DBL). Giuliani's first arrest came in May 1986 with the apprehension of DBL investment broker Dennis Levine. Giuliani then went after Ivan Boesky who admitted he had used inside information provided

by Levine and agreed to pay \$100 million in fines. Giuliani and his team convinced Boesky to wear a “wire” to help bring down 10 other traders at DBL who eventually pleaded guilty to securities fraud. It was later reported that Giuliani had allowed Boesky to take a \$50 million tax write-off on his \$100 million fine. Giuliani’s 4,152 convictions also encompassed ordinary criminals, including drug dealers, and members of organized-crime families.

Giuliani’s treatment of Richard Wighton and Timothy Tabor of Kidder, Peabody, and Company and Robert Freeman of Goldman, Sachs was reportedly very different than those involved in the DBL arrests. People who are accused of white-collar crimes are generally allowed to surrender themselves. However, Giuliani chose to embarrass these individuals by having federal marshals arrest and handcuff them. Wighton, for instance, was arrested at his office, where he was led away in tears. This behavior was also markedly different from Giuliani’s arrest of members of the Gambino crime family. Paul Castellano was picked up at home, never handcuffed, and was allowed to buy a candy bar on his way to the police station.

After losing a 1989 campaign for mayor of New York, Giuliani was successful in winning the office in 1993, focusing his campaign on improving the quality of life for citizens of the nation’s largest city by improving education and curtailing crime. Some critics argued that the mayor treated a number of groups with no more respect than he showed criminals. Giuliani’s record on civil liberties and civil rights was decidedly abysmal. Giuliani supporters, however, pointed to the mayor’s record on fighting crime that had resulted in the Federal Bureau of Investigation’s (FBI) naming New York City as the safest large city in the country. In addition to safer and cleaner streets, Giuliani reduced welfare rolls and taxes, increased jobs in the private sector, and revived New York City’s nightlife.

Ruth Messinger, Rudy Giuliani’s Democratic challenger in the 1993 campaign, had pointed out with much truth that Giuliani had no real plan for his second term. He did promise to spend \$64 million more of the city’s money to hire 40,000 new police officers. Perhaps the most ludicrous of Giuliani’s actions during his second term was his campaign to make New Yorkers more polite. Instead of focusing on hardened criminals, the mayor instructed his police officers to go after jaywalkers, litterbugs, the homeless, “irresponsible” taxi drivers,

“dangerous” bicyclists, food vendors, street artists, and owners of shrieking car alarms. A number of friends and allies turned on Giuliani when he laughed at recommendations from his own 28-member taskforce on Police-Community Relations. When things started to unravel in his second term, his political enemies, including liberals, Harlem politicians, educators, and civil libertarians also turned on Giuliani with a vengeance. The mayor’s approval rating dropped an amazing 21 percent.

While Giuliani had survived other crises concerning his overzealous police officers, things came to a head in 1999 when four police officers on routine patrol fired 41 shots at Amadou Diallo, an unarmed immigrant street peddler. When Giuliani called for caution until the facts were known, “Impeach Rudy” and “Depose Rudy” slogans sprouted around the city. The Diallo murder seemed to be part of an overall pattern of harassment and humiliation leveled at minority residents by the police department.

Giuliani’s 2000 campaign for the U.S. Senate against First Lady Hillary Rodham Clinton promised to be bitter and expensive. However, in the midst of the campaign, Giuliani announced that he had prostate cancer and withdrew from the race.

By all accounts, Giuliani was a political has-been, and then terrorists, guided and supported by Osama bin Laden’s al-Qaeda network, hijacked two planes into the World Trade Center in New York City on September 11, 2001. It was almost as if Giuliani had been born to be the mayor of New York City at this time of crisis. Becoming known as “America’s Mayor,” Giuliani led devastated New Yorkers and a stunned nation through the devastating terrorist attack. It seemed impossible for him to make a misstep because his concern was so evident and so genuine. He managed to overshadow the still untested president of the United States, George W. Bush.

## Global Crossing

GLOBAL CROSSING, Ltd. is an international telecommunications business delivering phone and data services to Europe, Asia, and Latin America. Global Crossing went public in August 1998 at a split-adjusted \$9.50 per share, and barely seven months later, its price had soared to \$64. Its market capitalization, at \$47 billion, briefly exceeded that of General Motors.

Like many of the other high-tech companies of the 1990s, Global Crossing's grand corporate status was brief. It was plagued with unstable management (five chief executive officers in four years) and with accusations of questionable accounting practices. Global Crossing filed for Chapter 11 bankruptcy on January 28, 2002. The company's bankruptcy, at \$26 billion, was the fourth largest in U.S. history ranking just after Enron Corporation at \$63 billion, Texaco at \$36 billion, and Financial Corporation of America at \$34 billion.

Gary Winnick founded Global Crossing Ltd. in 1997. It started by laying fiber-optic cable across the Atlantic Ocean in 1998, and by late 1999 the telecommunications firm had grown to deliver data services to Europe, Asia, and Latin America and was wildly successful. Winnick's secretary became a millionaire, and Winnick paid what is thought to be the highest price ever for a single family home in the U.S., more than \$60 million for an estate in Los Angeles' Bel Air neighborhood. According to Winnick, "Money's no fun unless you spread it around."

In 1997, when Global Crossing was founded, the commercial logic of heavy investments in fibre-optic networks seemed impeccable; there was a global shortage of high capacity cable necessary to meet the data transmission needs of the quickly growing internet. Many high-tech firms attempted to meet this need, and due to competition, bandwidth prices soon plummeted. Like that of many other once high-flying technology and telecommunications companies, the stock of Global Crossing

slid precipitously after March 2000. After reducing its earning forecasts sharply during August 2001, the company announced in October that its revenues and cash flow would fall even further below expectations. The next day, Standard & Poor's removed Global Crossing from the S&P 500 stock index. Winnick's stake in the company shrunk from \$6 billion to \$30 million. In 2003, Winnick was dropped off the *Forbes* magazine list of the 400 richest people.

The Federal Bureau of Investigation (FBI), and the Securities and Exchange Commission (SEC) both opened inquiries into the accounting practices of Global Crossing in February 2002 after Global's former vice president, Roy Olofson, stated that the firm artificially inflated its profits. Global Crossing was sold to Singapore Technologies Telemedia (STT) in October 2003. Although the FBI, the Central Intelligence Agency (CIA), and the Pentagon all objected to the sale due to STT's close relationship with the Singaporean government, President George W. Bush said he had no problems with the sale. The probable sale price was only \$250 million to control 61.5 percent percent of the firm.

## global warming

IN THE UNITED States, the early 1970s signaled a new awareness of the effects of continued exploitation of the environment. Over the next 10 years, scientists developed an understanding that global warming was a reality rather than a theory. Despite

the recognition that new environmental policies were crucial, environmentalists were forced to battle with conservative business persons who argued that economic interests should take precedence over environmental protection. However, environmentalists successfully lobbied for the creation of the Environmental Protection Agency (EPA), which was created in 1970 and given oversight over environmental issues. The EPA was also charged with ensuring compliance with new environmental laws and regulations.

In the study of white-collar and corporate crime, environmentalists point to the ultimate criminal industrial act: the aggregate of air and water pollutants and their effects alter the climatic patterns of the earth, endangering millions, if not billions of lives.

While most scientists have recognized the real dangers in the prospect of global warming, a small number of scientists insist that the threat has been overstated. They believe that changes in the earth's temperature are a result of natural cycles. Predictions that the earth's temperature will rise as much as 50 degrees Celsius or 90 degrees Fahrenheit by the middle of the 21st century, however, have created an environment of dire concern. This concern has been heightened by an upswing in worldwide natural disasters that have been attributed to global warming, encompassing everything from extensive flooding and draughts to mass starvation and disastrous hurricanes.

Much of the concern about global warming has been directed toward the so-called greenhouse effect. Actually, the greenhouse effect, which is essential to life on this planet, is created by a naturally occurring blanket of air, or ozone layer, that protects the earth from the sun's extreme heat. However, scientists have distinguished between this natural greenhouse effect and the anthropogenic or unnatural greenhouse effect that is created by the buildup of industrial pollutants that contribute to global warming.

Most scientists agree that global warming is caused by the emissions of fossil fuels that release carbon dioxide and other gases, such as methane, nitrogen oxide, ozone, and chlorofluorocarbons into the atmosphere. The greatest pollutants are coal and oil, but natural gas has also contributed to the effects of global warming. By the end of the 20th century, scientists had also documented an increase in the amount of chlorine in the atmosphere, amount-

ing to more than a 600-percent rise over levels of the previous 40 years. This increase of chlorine in the atmosphere also interferes with the way that ultraviolet radiation is blocked. Deforestation has also contributed to global warming because trees serve as natural barriers to trap pollutants and prevent them from being released into the atmosphere. If the earth's temperature increases beyond a certain point, the flooding of coastal areas could result in the rapid spread of infectious diseases, and the world's food supply might be threatened by extensive draught.

Scientists believe that global warming began in the early days of industrialization when coal and oil were first introduced into the atmosphere, with an accompanying increase in the levels of carbon dioxide. Since World War II, an increase of 25 percent in the concentrations of carbon dioxide and other heat-absorbing molecules in the atmosphere has been documented, resulting in a decreased ability to regulate the earth's temperature. These changes in the earth's atmosphere have a detrimental affect on human beings, wildlife, plant life, and on the overall environment. As worldwide population increases, so does the likelihood of global warming as more pollutants rise into the atmosphere.

#### CONGRESSIONAL ACTION

Drastic changes in the behavior that produces global warming should be a priority for legislatures and executives at all levels of government; however, environmental policy often gives way to political and economic concerns. Former Vice President Al Gore is one of the few politicians who has consistently made global warming a priority. Gore's interest in global warming began as an undergraduate at Harvard University under the guidance of Dr. Roger Revelle who was the first scientist in the world to monitor the effects of carbon dioxide on the atmosphere.

For the first time in any presidential election, global warming was a major issue in a presidential campaign when Gore ran as the Democratic nominee in the 2000 election. Gore won the popular vote but lost the presidency to Republican George W. Bush under what many people felt were unfair circumstances. Both as a member of Congress and as vice president, Gore tried to convince other policy makers that the dangers of global warming are real. He worked diligently for changes in environmental

policy that were designed to head off some of the worst effects of global warming.

In 1988, which was seen as a time of particular significance in the study of global warming, Gore was joined by other environmentalists in Congress to push for new legislation aimed at controlling the climatic threat that many people believed had affected an outbreak of heat waves, draught, air pollution, and forest fires. In August of that year, Colorado Senator Timothy Wirth introduced the Natural Energy Policy Act designed to promote energy efficiency and control global warming through limiting deforestation, curbing excessive population growth, and increasing funding for the development of alternative energy sources. Donna Fitzpatrick of the Department of Energy lobbied against the bill, arguing that such actions were premature since global warming was still an unproved theory.

In May 1989, Gore chaired a Senate committee that examined scientific research on global warming. The Gore Committee invited scientists to discuss global warming with the committee, and committee members waded through thousands of pages of testimony. During the examination, Gore discovered that the Bush administration had altered the testimony of James Hanson, a foremost expert on global warming, to make imminent threats of global warming seem less likely. In his testimony, Hanson stated that he was 99 percent certain that global warming was caused by human actions and not by naturally occurring factors. Senators Gore and Wirth lashed out at the Bush administration and demanded that the administration live up to its campaign promises to work toward reducing the greenhouse effect.

Researchers have identified three steps that Congress should take to reduce the effects of global warming on the planet: First, legislative efforts should be made to strengthen fuel-efficiency standards for all vehicles to reduce levels of carbon dioxide emissions. Second, legislators should remove all loopholes in the 1970 Clean Air Act that allow coal-fired utilities to continue to pollute the environment. Finally, Congress should encourage the efforts of coal-powered utilities to convert to natural gas by providing tax incentives.

When the EPA was created, it was given the responsibility of working with the states to help them comply with federal guidelines. Each state then created its own EPA to regulate environmental issues within the state and to work with the federal admin-

istration. Many states began to take an aggressive role in regulating their own environment and challenged neighboring states for spreading pollution outside their borders. For example, in 1997, eight northeastern states petitioned the EPA to force several midwestern states to reduce the emissions of nitrogen oxides that were contributing to urban smog in the Northeast.

In recent years, some states have taken the lead over the federal government to fight global warming. For example, in October 2003, California announced that it would sue the EPA over the decision handed down by the Bush administration that the EPA has no authority to regulate automobile emissions that contribute to the effects of global warming. New York, Massachusetts, and Oregon were also expected to bring suit, along with environmentalist groups such as the Sierra Club and the Natural Resources Defense Council.

#### KYOTO PROTOCOL

In 1988 in Toronto, Canada, the World Meteorological Association Organization and the United Nations Environment Program established the Panel on Climate Change to examine the affects of global warming on the nations of the world. As a result of the panel's work, 176 countries participated in a worldwide conference on global warming in 1997 in Kyoto, Japan. The Kyoto Conference produced the Kyoto Protocol in which each participating country agreed to set targets for reductions in the emissions of carbon dioxide and other pollutants that contribute to the greenhouse effect and established a timeline that individual countries must meet.

Industrial nations that bear the most responsibility for environmental pollution were required to initiate changes more quickly than were developing nations that produce less pollution. The Kyoto Protocol also established so-called credits that could be earned by countries with low levels of emission. The credits could then be sold or traded to industrial nations to offset their excessive emissions of polluting gases.

President Bill Clinton signed the Kyoto Protocol on November 12, 1998, pledging that the United States would reduce carbon emissions by 7 percent below the 1990 levels by 2012 and sent the Comprehensive Electricity Competition Act to Congress. In 1999, the Clinton administration an-

nounced new guidelines that would take effect in 2004, mandating cleaner gasoline and requiring oil companies to remove pollutants such as sulphur from gasoline. The new regulations included strict emission standards on all automobiles, sports utility vehicles, and light trucks. American businesses claimed that such actions would necessitate increased energy prices that would in turn reduce consumption. It was estimated that the overall costs of complying with the Kyoto Protocol and Clinton's energy act would be from \$7 to \$12 billion. In May 1999, a United States court of appeals blocked the new EPA standards, agreeing with the business community that the changes would be too costly.

### SIGNS OF GLOBAL WARMING

In the 21st century, global warming is of crucial importance for countries all over the world. A spot near the equator in Brazil, approximately halfway between the North and South Poles, has been used to illustrate the extent of environmental damage caused by civilization. Clouds of smoke hover over the rainforests that are so crucial to the ecological balance of the planet because of the oxygen that they generate. Parts of the rainforests have been burned to make way for factories, fast food restaurants, and other signs of civilization, even though the plants, birds, and animals found in the rainforests can never be replaced. Even the most isolated parts of the world suffer from some of the effects of global warming because of water and air pollution, illegal waste disposal, oil spills, and acid rains that migrate from more civilized areas.

In 2001, scientists reported that the snows of Kilimanjaro (the highest mountain in Africa) which were made famous in 1952 through a short story by Ernest Hemingway, were in danger of melting away by 2016. Glaciers in the Bolivian Alps were expected to suffer a similar fate by 2011. In 2002, scientists reported that a 5.4-degree rise in Alaska's temperature over the previous 10 years had resulted in irreversible changes in Alaska that were causing melting permafrosts, sagging roads, and dying forests. Some people believe that the changes in Alaska's environment can be traced to the 1970s when Alaska was opened up for oil exploration, allowing boreholes to be drilled in the frozen earth.

Scientists announced in September 2003 that a huge ice shelf in the Arctic Ocean, known as the Ward Hunt Ice Shelf, was breaking up after three

thousand years, giving eerie credence to the threat of global warming.

## globalization

ALTHOUGH MODERN capitalism began emerging in the 15th and 16th centuries when international trading became lucrative for Western nations and private enterprise, the new economic world order emerged about 40 years ago.

This new world order is referred to as post-capitalism or globalization. Both terms refer to a set of social, political, economic, and cultural dynamics leading to the development of shared cultures internationally via the internet, the growth of transnational corporations across national boundaries and trade agreements via the European Union (EU), the World Trade Organization (WTO), the General Agreement on Tariff and Trades (GATT) and the North American Free Trade Agreement (NAFTA).

By the mid-1990s these trade agreements increased the U.S. control of the world market from 25 percent to 50 percent. The WTO, created during the 1994 Uruguay Round of the GATT, has members who are not elected but appointed, yet control virtually all trade on the planet. As bureaucratic

trade specialists representing each nation, their only goal is to represent each country's economic interests. With a two-thirds vote the WTO can change existing international trade rules without referring to nationally elected legislatures. Furthermore, member states can challenge other states' laws for being protectionist of domestic industry or discriminatory against imports.

Similarly, NAFTA actually allows transnational corporations themselves to sue nations for violating free trade rights. The absence of an effective and enforceable body of international law leaves this undemocratic system unchecked, and the ensuing economic inequality often transforms into racial, ethnic, and religious-based hatred and sometimes even genocide.

#### FINANCING GLOBALIZATION

Free trade or cheap trade is facilitated by a variety of international financial institutions like the World Bank and the International Monetary Fund (IMF). These institutions loan money to developing nations under specific conditions that often dismantle state-run industries and eliminate state-run social, work, and health programs thus harming local citizens while increasing the profits of the transnational companies.

Thus, some economists say historical colonialism and jingoism now exist under the guise of Western loans through the World Bank, IMF structural adjustment programs and multinational corporate exploitation of third world nations through the WTO. Liberalized trade laws and a skewed decision-making structure benefited wealthy nations and transnational corporations while harming less developed and industrial nations. This global structure tolerates repressive regimes, forces population movements, and facilitates genocide, destroys the environment, and violates the human rights of indigenous peoples while damaging health and social welfare programs.

For example, in 1992, the U.S. corporation Occidental Petroleum muscled a deal with the state of Colombia to drill an oil well on the reservation land of the indigenous U'wa people, destroying their land and usurping their power. Similarly in Nigeria, the Ogoni people, an indigenous ethnic minority, have been the victims of a corrupt alliance between the state and Shell Oil Company since 1958, when Shell began exploiting oil and natural gas reserves

leading to oil spills, and air and groundwater pollution. Finally, in Ecuador, ARCO, Shell, and Texaco—preceded by the rubber companies in the early 20th century—have used violence and debt bondage to exploit the labor and land of indigenous tribes. Since 1970, this type of corporate colonization has displaced 18,000 people from 247,000 acres of land in Ecuador.

These treaties exploiting free trade zones have also resulted in corporate complicity with state-sponsored paramilitary or secret police, mistreatment and bullying of workers, and forced movements of indigenous populations to make way for economic enterprise. The Zapatista National Liberation Army, a peasant movement from the Chiapas region in southern Mexico, has grown partly as a result of NAFTA: in lowering trade barriers, NAFTA has also increased the poverty level of peasants and contributed to a loss of Mexican jobs.

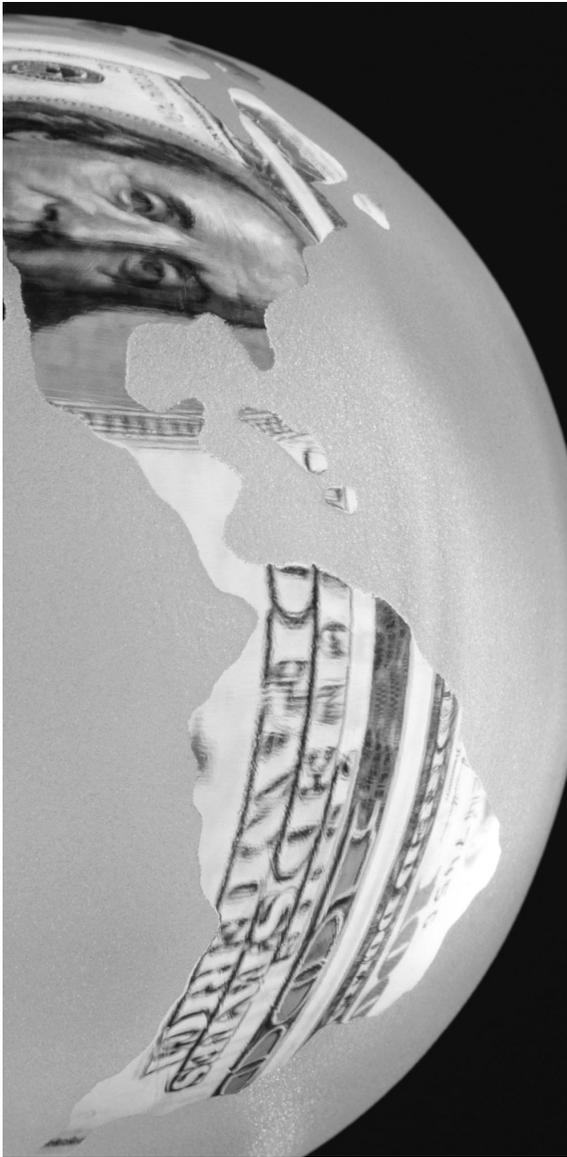

Combined, these international trade bodies like the WTO and the European Union translate into minimal government regulation of wealthy transnational companies, limited tariffs across national borders, and increased economic inequality within Western societies, and between Western societies and developing nation states. Specifically, between 1982 and 1990, foreign direct investment between developed and developing nations rose from \$20 billion to \$278 billion, and while this benefits Western elites it generally fails to benefit the majority of the developing nations' people.

#### DE-INDUSTRIALIZATION

The 1974 Trade Act passed during President Richard Nixon's administration and strengthened in 1984, called for a trade policy that sanctioned countries who refused to open their borders to U.S. products. An additional characteristic of globalization includes the growing international immigration trends.

For example, immigrants are now 12 percent of American workers and that often translates into poorer wages fueling growing economic inequality. Moreover, these immigrants move to the United States in search of the American dream denied to them by American industries already transplanted in foreign markets as the result of the free trade agreements.

Additionally, the result of these trade policies for American industry at home includes plant fore-

*The effects of globalization include economic hegemony, the capitalist economic system reigning over native needs.*

closures and primarily loss of jobs to foreign workers overseas. Thus, the de-industrialization of America's inner cities is the result of transnational corporations movement to developing nations. A transnational corporation has roots in one nation and subsidiaries often located all over the world. Many of these corporations have annual profit margins that are larger than the gross domestic product of some nation states.

Most of these transnational corporations were born in the Western world, that is Western Europe, the United States, and Canada and, of course, Japan. Three-fifths of these companies are U.S. companies. In 1970 across the world, only 7,000 transnational corporations existed, by 1996 there were over 40,000 such companies. They control 70 percent of products traded internationally and 80 percent of the world's land under cultivation for export crops. These transnational corporations are also the source of most of the hazardous materials and pollution produced across the globe. This includes the common method of oil extraction and oil refining. Transnationals also control the production of some of the most toxic chemicals known to human kind such as DDT (a pesticide banned in the United States), dioxins and PCBs.

#### WORKER EXPLOITATION

This world market also provides cheaper investments with increased profits to corporations as the result of the absence of minimum wage laws in developing nations. These corporations also take advantage of U.S. territories where U.S. labor laws do not apply. Specifically, Saipan, an island in the Commonwealth of the Northern Mariana Islands, maintains a number of U.S. owned garment manufacturing companies that export \$1 billion worth of clothing to America on an annual basis. However, employees working on the factory line are paid about \$2 below the U.S. federally required minimum hourly wage. Ninety-percent of the workers are generally women from China, the Philippines, Bangladesh, and Thailand.

These women are recruited by deception through expensive recruiting fees, trapping the workers in a state of indentured servitude until they pay off their travel fees. The workdays are seven days a week, 12 hours a day with quota production requirements, and the workers are required to live within the plant behind barbed wire fences. This is a global sweatshop.

In 1999 three groups of former workers sued 26 U.S. based retailers, including Nike and the Gap for operating a sweatshop, another group of 50,000 workers filed suit against 18 U.S. retailers alleging a violation of the Alien Tort Claims Act. One suit has been successfully won by the plaintiffs, however, several years later no plaintiff has received monetary reimbursements from any company. Unfortu-

nately, sweatshops like these also exist within the 50 contiguous United States and in other locations across the globe with most operated by large Western transnational corporations.

For example, if you purchase a tee-shirt that indicates it was made in Thailand, Taiwan, or Indonesia, it was probably made by an employee of large U.S. transnational corporation who contracted out its labor for a few cents an hour per employee. While Americans are told this will allow them to buy such clothing at cheaper prices, that is not necessarily the case, rather it is the corporate moguls who are making more money from this arrangement, not the workers and certainly not the consumers. Additionally, these dynamics lead workers in developing nations to believe that they might make more money if they move to the United States. They emigrate only to find that they are trapped in low-level minimum wage service sector jobs, or more dangerous or repetitious manufacturing jobs that American citizens refuse.

Thus, globalization leads to the fragmentation of labor nationally and internationally, making it more difficult for middle- and lower-level workers to organize for better pay and benefits. While simultaneously, those at the top of the economic hierarchy are making more money leading to additional income inequality.

Researchers Arthur S. Alderson and Francois Nielson synthesized these ideas in a cross-national test among 16 different nations and found that direct foreign investment, increased trade from the south to the north (across nations), the percentage working in lower-level service sector jobs (food service, for example), the percentage working in agriculture, and increased immigration, resulted in increased economic inequality among post-industrial nations. Further, declining memberships in trade unions increases economic inequality while increased welfare programming and improved wages across blue- and white-collar occupations resulted in decreases in economic inequality.

The global economic market is also controlled by Western powers using economic sanctions instituted to punish authoritarian regimes and, sometimes, simply to punish nations who disagree on foreign policy issues. For example, in the 15 years of economic sanctions against Iraq before the 2003 war, ordinary citizens were deprived of grain and other necessary goods. These sanctions compounded the Kurdish minority population's inability to

muster the resources necessary to combat Iraqi leader Saddam Hussein's genocidal campaign against them.

Furthermore, Western governments—particularly the United States and the United Kingdom—have installed oppressive rulers, sold weapons to juntas and fostered a “culture of corruption” by allowing transnational firms to bribe foreign officials. Similarly, the U.S. government has controlled insurgent-class or race-based social movements, through its military and the Central Intelligence Agency (CIA), wherever groups threaten U.S. corporate hegemony.

While the Cold War may have been a convenient disguise for CIA-initiated murder and mayhem from Central and South America to Asia and Africa, motives more accurately involve the maintenance of corporate hegemony. For example, the CIA orchestrated the overthrow of democratically elected President Salvador Allende in Chile in the 1970s, a socialist who would ensure state-ownership of businesses, and replaced him with General Augusto Pinochet, a dictator supportive of U.S. capitalist interests. Following the military coup, Pinochet's regime was responsible for over 4,000 disappearances and murders from 1973 to 1975.

#### CORPORATE CRIME = STATE CRIME

Clearly, white collar crime in the form of corporate crime is tied to state crime. Furthermore, these crimes often involve a violation of the international convention on the Declaration of Human Rights, especially on the part of the U.S. based transnational corporations.

For example, in 1992, in the case of U.S. corporation Occidental Petroleum mentioned earlier, the company purchased the right to explore a part of the U'wa's (an indigenous group to the area who have occupied the land for centuries before the government of Colombia began selling it to colonizers) land called the Samaore Block. This land area is a part of the South American rainforest. Occidental petroleum was given the right to drill for oil by the Colombian government in 1999. Specifically, the U'wa tribe was deceived and told they were signing an attendance sheet when they were actually signing an agreement establishing conditions for the exploration of the U'wa land.

Following that white-collar crime, the Colombian government gave permission to Occidental to

continue to explore with any additional meetings with the U'wa. Finally, after years of negotiation with the Colombian government, the U'wa were given official permission to own most of their historically controlled land (543,000 acres).

However, one month later the government gave Occidental petroleum a license to begin drilling oil about 500 meters from the border of the U'wa's land, but still within their ancestral territories. The experts expect that such drilling will result in the typical toxins released from drilled oil wells including arsenic, lead, mercury, benzene, naphthalene and other hydrocarbons that will subsequently lead to large-scale pollution and soil erosion. Occidental has already contaminated surface water in other oil-fields in Colombia at 50 times the rate of acceptable international standards.

The Inter-American Commission on Human Rights has found that human exposure to these chemicals leads to adverse affects including birth defects, cancer, and spontaneous abortion. Such exploitation of the natural environment and harm to humans are becoming widespread throughout the globe, with indigenous peoples bearing the brunt of these harms most directly. And, while some of these harms are considered violations of international law, international law is less respected than the desires of international corporations or their governments and free trade laws.

Though the right to a healthy environment exists in international law through the Covenant on Economic, Social and Cultural Rights (the legal "teeth" of the Declaration of Human Rights), the United States has refused to ratify it. Also, the Rio Declaration is a binding international treaty obliging all nations to recognize the right to a healthy environment, and only 34 out of 190 nations have not signed this agreement.

Economic globalization has deprived the U'wa people (as just one example) of their food supply and clean water, but one of the provisions of the International Covenant on Civil and Political Rights and the Economic Covenant (the second agreement that enforces the Declaration of Human Rights) includes not depriving a people the right to its own means of subsistence. Nonetheless, globalization or free trade allows this situation in Colombia to occur. Similarly, large-scale international dumping of nuclear waste also occurs even though the United Nations (UN) Committee has stated that such offenses violate the human rights to life, health, and

security. But this UN committee has virtually no international enforcement power.

Similarly the Inter-American Commission on Human Rights (a weaker international body than the UN Human Rights Committee) stated that harm from mining activities also violates the right to life and health. The International Labor Organization Convention Number 169 also recognizes the special importance of indigenous peoples' relationship with their land and requires the safeguarding of their environment including protection against the disposal of hazardous or toxic substances. However, many nations, including the United States ignore these decisions and similar international agreements.

#### INEVITABLE CONCLUSION

Proponents of globalization profess that what is good for multinational corporations is, in the end, good for the world, just as in the mid-20th century, what was good for General Motors or IBM was good for America. The overt mission of the World Bank and IMF and other such institutions is to relieve world poverty by providing jobs where none existed, to spread the material benefits of capitalism among all people, not just the first world.

But the record of globalization in the issues of environmentalism, labor, and white-collar corruption does not show attainment of lofty corporate worldwide goals. Rather, the modern-day economic globalization and neo-colonization translate into American (mostly) corporate exploitation of the markets of Asia, Latin America, and Eastern Europe, resulting in enormous profits from wanton violation of human rights.

American courts could respond to human rights violations through the Alien Tort Claims Act of 1789. This act permits foreign nationals to sue for violations of the law, including torture, summary execution, genocide, war crimes, disappearance, arbitrary detention, slave trading, and cruel or inhuman and degrading punishment. Some foreign nationals have successfully won lawsuits based upon such human rights violations against nation states and private individuals in the United States. However, in a recent court case by two Burmese employee unions, this act failed to protect Burmese foreign nationals who allegedly lost property, were tortured, and forced to work by Unocal Corporation and a state-owned industry in extracting natural gas.

Ironically enough, the Unocal case had a German Nazi industrial precedent. When Germany surrendered in 1945 ending the European part of World War II, Nazi leaders were put on trial for war crimes in Nuremberg, Germany. One of the Nuremberg trials found four German industrialists guilty of forced labor violations. In 2000, using these Nuremberg cases as a legal precedent, a California District court in *Doe I v. Unocal Corporation*, failed to find Unocal guilty of forced labor practices violating international law, because Unocal took no active steps to cooperate in the forced labor of Burmese citizens, primarily orchestrated by the Burma (Myanmar) state government.

In 2000, the German government signed an agreement to create an industry-funded foundation aimed at contributing 10 billion German marks to compensate the slaves and forced laborers exploited in World War II. This could lead the way to holding corporations responsible for continued human rights abuses under the guise of free trade or economic globalization. The Alien Tort Claims Act does not cover cultural genocide, environmental abuses, violations of freedom of speech or price fixing, as a violation of international law or human rights.

Economic globalization is touted by some media and economists as beneficial. Yet the staggering aggregation of white-collar, corporate, environmental, labor, and human-rights crimes hardly supports the view.

## government contract fraud

IN ORDER FOR AMERICAN society to function properly, the government must provide its citizens with a variety of services that provide for their safety and security. For example, when a vacant lot full of leaking chemical drums and barrels is discovered in an area that threatens a public drinking water supply, site remediation may be required. Rather than employ a large number of public employees who would be tasked with mitigating a hazard of this magnitude, the government may select a private company to perform the necessary clean up. This private company, commonly referred to as a contractor, works under the authority of a government agency, and the supervision of an agency official.

The agency official responsible for overseeing the contractor's day-to-day activities is known as a contracting officer's representative (COR) or contracting officer's technical representative (COTR). Contractors perform a variety of services for the government, including entering data into information systems, performing scientific experiments, serving as security guards at public warehouses and military installations, constructing buildings and roads, conducting training courses for public employees, and writing and editing government publications. In addition to awarding contracts for services, the government also enters into agreements for products and supplies.

From cleaning solvents and paper clips, to computer systems and military armament, government vendors provide public agencies with a wide range of items that would prove cost-prohibitive for the

agency to manufacture independently. In order to ensure that these products meet the needs of the agency, government officials prepare specifications for these items that must be strictly adhered to by prospective vendors.

Ideally, the U.S. government contracting process, which is budgeted at more than \$200 billion each year, is mutually beneficial to agencies, product manufacturers, equipment suppliers, and service providers. It is intended to encourage competition among prospective contractors who compete for government projects, ensuring that agencies receive quality products and services at fair market prices. Unfortunately, some government contracting agents and prospective vendors conspire to ensure that a specific firm is selected to provide a good or service. Such illicit activities are referred to in the U.S. Code (18 U.S.C. 201) as bribery, which is defined as "... receiving of anything of value in corrupt payment for an official act."

Motivations for engaging in these official forms of corruption may stem from a desire on the part of the agency official to receive a kickback from the selected firm, find employment for a friend or relative (other even for themselves after leaving government service), or receive some other form of gratuity or gift (expensive jewelry, vacations).

Vendors who produce agency-specified goods or provide services to the government may conspire in an effort to artificially inflate the price of a product or service. Firms may also engage in the predatory practice of bid-rigging, meaning that a group of well-established prospective contractors notify one another in advance as to what their proposed cost estimate for a government project will be (the bid submission process is usually confidential), and they subsequently take turns submitting low bids on certain projects. By unfairly exchanging their proposed cost estimates, a few key firms are able to simultaneously set the market price and limit competition by new or smaller companies.

Products manufactured under government specifications occasionally do not meet the standards that have been mandated by the agency. For example, in 2003, the Northrop Grumman Corporation agreed to pay the U.S. Navy \$20 million in penalties after getting caught supplying the military with defective parts for their unmanned drone aircraft.

Lastly, some vendors simply overcharge the government for the total amount of hours rendered

on a project, or deliberately short-change the agency in the quantity of supplies shipped.

In an effort to curtail misusing a government contracting position for personal gain, discourage bid rigging, and reduce the likelihood that defective products will be shipped, the federal government has more than 225 years experience developing and implementing acquisition and procurement regulations.

## A BRIEF HISTORY

As early as 1775, the Second Continental Congress realized that it was essential to the burgeoning nation's growth to "... maximize competition, obtain fair prices, and assure accountability of public officials for public transactions." By 1792, Congress had already passed legislation requiring that military supplies be procured through the Treasury Department and not by the army. This early effort to decentralize the process of obtaining goods and services was followed by statutes in 1861 and 1910, which required the government to advertise solicitations for products and projects. With the exception of times of "public exigency," these regulations remain in effect today for nearly all government agencies.

During World War I, unscrupulous contractors realized that they could make large sums of money by inflating the costs associated with producing military vehicles, weapons, and ammunition and passing these fictitious costs on to the government agencies who purchased these products. Other vendors deliberately conspired to create false shortages of supplies in an effort to drive up prices through increased demand. Some companies aggressively lobbied public officials in an effort to win major contracts to build ships and other projects. In an effort to combat such situations, Congress enacted the Federal Property and Administrative Services Act of 1949, which mandated open advertising for government-procured goods and services. Subsequent legislation designed to promote fair competition and prevent price gouging by manufacturers and suppliers included the Defense Acquisition Regulation and the Federal Property and Administrative Services Act.

In 1974, Congress further streamlined the process of specifying the terms and conditions of contracts through passage of the Federal Procurement Policy Act (Public Law 93-400). The primary

purpose of this legislation was to establish “a single simplified, uniform federal procurement regulation” for all federal agencies. This effort led to the development of the Federal Acquisition Regulation (FAR)—a set of procedures that must be followed by federal agencies when contracting for services or supplies.

### AN INVITATION TO FRAUD?

Despite the post-World War I and World War II efforts of Congress to develop a system that would establish “full and open” competition in federal contracting, subsequent legislation has actually proved contrary to these goals. For example, subpart 19.5 of the Federal Acquisition Regulations (FAR 19.5) requires that certain government projects be allocated to small businesses (that is, companies with less than 100 employees whose total sales do not exceed \$6 million in retail or service industries or \$28.5 million in construction). While small businesses are required to offer their products or services at “fair market value” if a contract is to be awarded, the prospective vendor need not offer the bottom-line lowest price. Thus, the government may spend more money than is really necessary to procure a good or service.

Similar acquisition regulations such as the 1984 Competition in Contracting Act and Federal Acquisition Streamlining Act of 1994 promote the utilization of women and minority-owned businesses for contracting at the federal, state, and local levels. These acquisition guidelines are controversial because some companies simply list such persons among their corporate officers without really utilizing their skills or talents.

For example, in early September 2003, Chicago-area residents James M. Duff and his mother, Patricia Green Duff, were indicted for allegedly “... getting a janitorial service, Windy City Maintenance certified as a women-owned enterprise by using his mother as a front,” as reported by journalist Mike Robinson. The alleged misrepresentation also made it possible for the defendants to receive public contracts “... set aside for such businesses, along with another company, called REM Inc., in which James Duff used a black associate, William E. Stratton, as a front for what was certified as a minority-owned business,” Robinson writes.

Congressional efforts to increase fairness in government contracting and to expand opportuni-

ties for small businesses to compete in the public marketplace continue to have many critics. One of the most common concerns expressed by both Congressional leaders and watchdog organizations is that big businesses and its ties to political leaders continue to overwhelmingly receive government orders for services.

For example, Texas-based Halliburton Corporation, which was previously run by Richard Cheney prior to his tenure as vice president of the United States, received contracts of nearly \$500 million for repairs to oil refinery infrastructure damaged early into the 2003 conflict in Iraq. Cheney received about \$1 million per year from Halliburton as part of his severance package for resigning from the corporation. Similarly, nearly a dozen senior officials of the Ronald Reagan, George H.W. Bush, and George W. Bush administrations have close ties to the Bechtel Corporation, which was selected by the U.S. government to receive more than \$680 million in construction projects in Iraq. In an effort to address such concerns, several lawmakers campaigned to enact legislation designed to limit the use of sole-source bidding on defense and reconstruction contracts in Iraq.

HANK J. BRIGHTMAN  
SAINT PETER’S COLLEGE

## government procurement fraud

ONE OF THE MOST IMPORTANT elements in the relationship between public officials and those whom they serve is trust. Private citizens must have

sufficient confidence in government employees to allow them to allocate resources on their behalf. Perhaps the most substantial form of trust bestowed upon civic representatives is the expenditure of public funds. Tax dollars generated from levies on income, real estate transactions, or sales of various goods and services allow our government to obligate these fiscal resources in areas that serve the common good (for example, national defense, public health, education, police and fire protection).

In order to ensure that the supplies and services obtained by the government are obtained at fair market value, and that there is fair competition among interested vendors, there is a stringent legal process, known as acquisition that must be adhered to by public agencies.

Acquisition is defined as “ordering from established sources of supply and services, using small purchase procedures, and contracting” by Management Concepts Incorporated (MCI). The public official responsible for awarding a contract to the vendor who had submitted the most appropriate project bid is referred to as a procurement officer or purchasing agent. Procurement officers and purchasing agents normally work under the direction of a contracting officer. Contracting officers are agency officials “who have been delegated specific authority to enter into and administer contracts on behalf of the government and make related determinations and findings,” according to MCI.

Contracting and procurement officers, purchasing agents, and other acquisition officials hold important positions of public trust in selecting vendors for government projects and ordering agency supplies. Unfortunately, some employees engage in illegal practices for personal gain. For example, in one such case, a regional motor vehicle fleet administrator for the General Services Administration with procurement authority “worked with an automotive repair inspector in a scheme: The vendor, a car-repair company, submitted inflated claims to the GSA officer who approved them, then took cash for the difference between the inflated claim and true cost ... [and they both] took cash sporadically along with free service for their own cars,” explains author Martin L. Gross.

Purchasing agents, contracting officers, and procurement officers are not the only government employees who participate in illegal acquisitions. Senior agency officials may attempt to bypass contracting regulations altogether in exchange for

lavish gifts, luxury travel, or high-paying employment for friends or relatives.

## CASE STUDIES

Former Paterson, New Jersey, Mayor Marty Barnes appeared to have the perfect existence. He was a likable, charismatic politician who had made strides in improving Paterson’s image as an urban city committed to both industry and the welfare of the community. Unfortunately, he also had a desire for the high life—things that could not be obtained on his modest salary as a public servant. Thus, it was not surprising to many local residents that in July 2002, Barnes pleaded guilty to charges of mail fraud, filing false income tax returns, and lying on ethics disclosure statements—a result of his allegedly soliciting lavish gifts from city contractors. Among those items or benefits he supposedly received were vacations to a castle in England with his spouse and to Aruba, Brazil, and the Kentucky Derby with (contractor-supplied) girlfriends, complimentary designer suits, new furniture, various private-sector jobs for friends and associates, and construction of a lavish swimming pool at his home, complete with a Polynesian-style waterfall. In 2003, he was serving a 37-month sentence in a federal correctional facility.

At the same time that Barnes serves out his sentence, former North Bergen, New Jersey, Town Administrator Joseph Auriemma is serving an unrelated three-year prison term for six counts of extortion, corrupt persuasion, witness tampering, and mail fraud. Auriemma allegedly accepted more than \$35,000 in cash and complimentary construction and renovation work (an upgraded bathroom, new roof, new furnace and air conditioning system) on his homes located in Bloomfield and Wildwood, New Jersey, in exchange for awarding nearly \$2.5 million in township and municipal contracts to pre-selected vendors.

Such acts of corruption are by no means restricted to New Jersey or even the East Coast of the United States, as evidenced by a recent massive corruption investigation in San Bernardino County, California. The investigation resulted in multiple federal grand jury indictments against five public officials and two private businessmen for allegedly engaging in a bribery scheme. The scam allegedly involved a complex conspiracy in which the officials would receive kickbacks in exchange for approving contracts to construct billboards at the intersec-

tions of I-10 and I-215 in the city of Colton. Those indicted included the San Bernardino County supervisor and chief administrative officer, members of the city council, and commercial real estate developers.

## COMBATING FRAUD

In addition to aggressively prosecuting those officials who misuse their positions of public trust in exchange for personal gain, the federal government also tracks companies and private individuals who are partners in these illicit acts (that is, bribery, filing false claims for services, or submitting phony invoices for products and supplies). In essence, a procurement official who suspects that a vendor has engaged in an illegal activity can submit a request for debarment to the General Services Administration. Upon review—which includes a form of administrative hearing that allows the vendor to respond to the allegation—the company and/or its principal employees may be entered into a database of parties excluded from participating in federal procurement programs (referred to as the Excluded Parties List System or EPLS).

The specific reason for inclusion in the EPLS (referred to as the cause code) is also entered, as is the duration of the debarment (known as the treatment). Persons or companies included in the EPLS are normally debarred from federal contracts for a minimum of three years up to life. This database is available online to all federal contracting officers, procurement officers, and purchasing agents who use it to screen out disqualified vendors prior to awarding government contracts.

## Grabosky, Peter (1945–)

PETER GRABOSKY is a professor at the Australian National University, in the Regulatory Institutions Network of the Research School of Social Sciences (in 2004). He holds a Ph.D. and M.A. in political science from Northwestern University, and a B.A. in government from Colby College. Before his current appointment, he served as deputy director of the Australian Institute of Criminology from 1983 to 2001.

Grabosky has held a number of other prestigious positions in the fields of criminology and law. From 1976 to 1978, he was a Russell Sage Fellow in Law and Social Science at Yale Law School, followed by a term as foundation director of the South Australian Office of Crime Statistics from 1978 to 82. From 1981 to 1983, he served as the head of Research and Projects at the Law Foundation of New South Wales. Additionally, Grabosky served as director of research for the Australian National Committee on Violence from 1988 to 1990. His leadership roles include president of the Australian and New Zealand Society of Criminology (1998) as well as deputy secretary general of the International Society of Criminology (1999).

Grabosky has written numerous books and articles on topics such as the use of incentives in the regulatory enforcement of white-collar and corporate crime, prevention and control of cyber crime, information systems, and related criminal justice and public policy issues. Some of his major contributions include *Of Manners Gentle: Enforcement Strategies of Australian Business Regulatory Agencies* (co-authored in 1986 with John Braithwaite); *Crime in the Digital Age: Controlling Telecommunications and Cyberspace Illegality* (with Russell Smith in 1988); *Electronic Theft: Crimes of Acquisition in the Digital Age* (with Russell Smith and Gillian

Dempsey in 2001); and *Smart Regulation: Designing Environmental Policy* (with Neil Gunningham and Darren Sinclair in 1998).

MICHIGAN STATE UNIVERSITY

## graft

ALSO DEFINED AS BRIBES, extortion, influence-peddling, kickback, tribute, or payola, graft is generally understood to be the offer or promise from one party to improperly influence the judgment of a second party. Graft covers a continuum from local police looking the other way for a free meal to a multinational corporation convincing a local politician to allow environmental waste to be stored in his jurisdiction.

The entry of graft into a transaction can come from the person with the controlling influence seeking remuneration, or the person desiring the object controlled by offering remuneration to the controlling party. Within the two extremes, other examples include: goods given to Olympic committee members to favor a certain city, a judge modifying his ruling, a governor issuing a pardon, and a chief financial officer of a corporation allowing stock manipulations to occur.

The problem of graft has plagued the American political scene since shortly after the first European settlements. Governor Benjamin Fletcher of New York (1692–98) accepted graft payments from pirates to allow their criminal activities, as well as demanded payments from local traders for the right to peddle their wares within the city. As more tariffs were later mandated, the success of businesses depended many times on the savings they could achieve between the difference in the tariffs owed, and the graft paid to avoid the tariffs. Boss Tweed and the Tammany Hall political machine of the

1870s brought graft to an art form, effectively controlling all aspects of New York politics; nothing could take place without payments made to the organization. Graft and corruption later marked several presidential administrations: Ulysses S. Grant, Warren Harding, Harry Truman, and Dwight D. Eisenhower.

As it relates to the public sector, graft involves the corruption of the American political system, a system in which elected officials or civil servants are to serve the interests of the citizens and not themselves. Graft, as it involves public corruption, violates an official's understood duty of faith. Graft can happen at the national level, for example, Abscam of 1970s and Wedtech of the 1980s; at the state level, for example, Florida judge Alcee Hastings' impeachment trial of 1989; or the city/county level, for example, Jefferson Parish (Louisiana) judge Ronald Bodenheimer's guilty plea in 2003 to fixing a civil domestic case. Often the offenders are persons wanting to gain an upper hand in a business transaction.

Some have come to believe that the grease of graft is required to navigate the political landscape; but the result of the "grease" is increased cost in most instances. As graft and bribes are not generally regarded as legitimate business expenses, the cost of the graft is then hidden elsewhere.

Graft paid to building inspectors has led to injuries caused by structural failures, and graft paid to judges has allowed criminals to remain free and possibly commit additional crimes. Graft paid to private sector recipients may result in medicines being approved through testing falsification, service contracts being awarded to a less qualified vendor, and entrance of a criminal element into financial operations.

#### FIVE AREAS OF GRAFT

Graft can be delineated into five areas: contractual, judicial, law enforcement, legislative, and regulatory. Contractual graft concerns the awarding of contracts in instances where the award of the contract is influenced by the payment of graft. The majority of these contracts emanate from the public sectors: road contracts, sewerage work, services, and equipment. Private sector contracts are often impacted by the payment of graft. The amount of graft offered in some contracts has eclipsed into hundreds of thousands of dollars.

Judicial graft concerns situations in which judicial decisions are influenced because of compensation, or promise of compensation, made to members of the judiciary. The decisions include: the outcome of civil and criminal trials, sentencing, the acceptance or rejection of charges, ruling during trials (admission of evidence, acceptance/refusal of testimony, applicable standards, etc.), and the assignment of a case to a particular judge. Graft can impact the decisions of not only judges but also other court officers, including prosecutors, records and docket clerks, and administrative personnel.

Law enforcement graft concerns instances in which policing decisions are implemented based on the receipt of bribes. These decisions range from misuse of police discretionary powers to intentional commission of felonious acts. Graft can impact a beat officer's decision to not arrest a neighborhood bar owner for selling alcoholic beverages to underage minors in exchange for free drinks, or incite a narcotics officer to execute a witness against an illegal drug operation in exchange for a cash payment.

Other policing acts influenced by graft include: failure to enforce criminal laws, charging for services which are part of their duties, supplying a police presence for convenience of criminals, destroying evidence, purposely violating an offender's right to obtain a later dismissal of the charges, theft of seized evidence (drugs) to return to the criminal owners, sale of confidential police records, and disclosure on information concerning pending enforcement actions, including raids, undercover investigations, wiretaps, and surveillances.

Legislative graft concerns situations in which legislative decisions are swayed by improper offers of personal gain. Impacted legislative decisions can include: passage of bills concerning zoning, passage of licensing or blockade of licensing bills, passage of bills concerning land or building grants, and passage of bills concerning settlements of lawsuits against the legislative body. The classification of persons involve can be Congressmen, legislators, Senators, commissioners, city council members, school board members, alderman, governors, and mayors.

Regulatory graft concerns the actions of regulatory board members who award or refuse licenses, certificates, and permits based upon graft payments. Regulatory boards action in question include the issuance/denial of: building permits, variances in zoning, taxi permits, operator licenses, retail alcohol

*From earliest civilizations, graft has always balanced the scales of justice in everyday life.*

outlet permits, health inspections, and professional licenses. The acceptance of graft can cause non-qualified persons to obtain professional permits and licenses; as well as businesses to open contrary to the wishes of the local population.

## Grant, Ulysses S. (1822–1885)

THE 18th president of the United States and the commander of Union forces during the Civil War, Ulysses S. Grant was associated with one of the most scandal-ridden presidencies in the history of the United States. While the concept of white-collar crime did not fully develop until the following century, federal officials were involved in some of the same sorts of investigations that have haunted contemporary administrations, including the criminal activities of a number of individuals within the president's administration. Grant was a popular choice for president to succeed Andrew Johnson (1808-75) who had become president after the assassination of Abraham Lincoln (1809-65).

The Grant presidency was a time of great political turmoil, and it was highly unlikely that any president of the time could have pleased the South recovering from the devastation of the Civil War while meeting the demands of the civil rights advocates who were anxious to establish political rights for former slaves. Grant was forced to walk a political tightrope as he oversaw the process of reintroducing the former Confederate states into the Union. Despite all the scandals of his presidency, Grant remained a hero to many Americans outside the South. While some contemporary scholars have argued that Grant was not directly involved in many of the scandals attributed to him, they did occur on his watch.

Grant lacked political experience and was not a loyal Republican. He had only voted for president once in his life when he cast a vote for Democrat James Buchanan in 1857. White House insiders had a low opinion of Grant as an administrator. It was well known that he often failed to appear at scheduled meetings, and Grant was notorious for neglecting to read important documents and for forgetting to answer urgent letters. He was ill equipped to deal with abuses of power by his staff or cabinet members. Grant was forced to deal with a Congress that had wrested as much political power as possible from his predecessor, including an impeachment that fell one vote short of removing Andrew Johnson from office. Congress saw no reason to yield power to Grant.

With Reconstruction at its height, partisan sniping was at an all-time high. From the beginning, Democrats claimed that the new president was a

thief, citing evidence of looting during the Civil War. The press frequently presented Grant to the public as a drunk who was incapable of exercising political judgment. Even the leadership of his own party was furious with him because he had chosen family members, army buddies, old friends, and campaign contributors to fill important political positions without consulting Republican politicians.

The Grant presidency was also known for its nepotism. Grant's father, brothers, brothers-in-law, father-in-law, and various relations of Mrs. Grant were all in positions to profit from association with the president. Grant's cousin, Silas A. Hudson, was named as a minister to Guatemala; his brother-in-law, Reverend M.J. Cramer was appointed as counsel to Leipzig. His wife's brother-in-law, James F. Casey, was given the position of collector of customs in New Orleans, Louisiana, where he amassed a fortune by stealing customs fees. Fred Dent, the president's brother-in-law and a White House usher, pedaled information that he garnered from listening in on secret meetings. Overall, around 40 of the president's relatives or family connections profited in some way from Grant's presidency.

The Civil War had provided fertile ground for profiteering, graft, and other forms of corruption, and money maker saw no reason to call a halt to their various making-making schemes in the years following the war. While a stronger president might have instituted reform, Grant was incapable of doing so. One of the first scandals to surface involved Secretary of State John Rawlins. After Rawlins died during his first year in office, it was discovered that he had received \$28,000 in bonds for his attempt to garner American support for Cuba in its fight with Spain.

A more serious scandal concerned William W. Belknap, the secretary of war, who reportedly made \$100,000 a year by selling licenses to dishonest suppliers. George M. Robeson, the secretary of the navy, earned \$320,000 in payments from navy vendors anxious to win government contracts. Columbus Delaware, the secretary of the interior, accepted bribes to record fraudulent land grants. William A. Richardson, the secretary of the treasury connived with the notorious Ben Butler to make money from delinquent tax payments. George H. Willen, the attorney general of the United States, used government funds to equip himself with a high-priced carriage and servants. The U.S. minister to Brazil, James Watson Webb, managed to extort \$100,000

from the Brazilian government for his personal use. Robert C. Schenck, the minister to Great Britain, sold nonexistent shares in a silver mine in Utah and claimed diplomatic immunity from prosecution.

Abel R. Corbin, a shady Wall Street operator and brother-in-law of Grant's, was employed by speculators Jay Gould and Jim Fisk in a scheme to make millions by cornering the gold market. For a \$25,000 payment, Corbin convinced Grant that farm exports would benefit from higher gold prices. The Treasury Department was subsequently told to refrain for selling gold as a means of stabilizing its price. The Gould/Fisk deal drove the price of gold from \$135 an ounce to \$163.50 an ounce, threatening economic stability on what became known as Black Friday.

Grant responded by ordering the sale of \$4 million in gold reserves, and the price of gold dropped to \$133 an ounce within 15 minutes of the sale. Another Grant scandal involved a scheme for the United States to take over the Caribbean island of Santo Domingo with the full assistance of the island's corrupt president who anticipated huge profits from the deal.

The Credit Mobilier scandal, which helped to define the Grant presidency as corrupt, actually took place between 1867 and 1868 while Andrew Johnson was in office. It was not until 1872 that the facts became known. The scandal occurred from the manipulations of the promoters of the Union Railroad who created a construction company to skim huge profits from federal subsidies, and sold shares that paid dividends of up to 350 percent to several corrupt members of Congress, including the speaker of the House and future president James A. Garfield (1831-81) who was assassinated only months after taking office. Other participants included Vice President Schuyler Colford and Congressman Oakes Ames of Massachusetts. In the eyes of the public, the scandal seemed to represent the worst of "Grantism."

Another major scandal erupted with revelations about the Whiskey Ring, an entire network of whiskey distillers, headquartered in St. Louis, Missouri, who had defrauded the government of \$1.2 million by avoiding taxes on their products with the help of a number of government officials. Ultimately, 152 distillers and 86 government officials were indicted, including Grant's private secretary Orville E. Babcock. Through Grant's influence, Babcock was exonerated while most defendants were

found guilty. While the scandal had begun during Johnson's tenure, Grant was implicated because he had accepted a team of horses and an expensive harness from members of the Whiskey Ring.

Corruption touched Grant even more directly after leaving office. The former president invested his entire life savings in a Wall Street partnership with a crooked associate. In 1884, Grant's assets were only \$210 and his home, and he was forced to declare bankruptcy. Mark Twain (author Samuel Clemens) published Grant's memoirs, with the intention of giving Grant 75 percent of the profit to help him recoup financially. By this time the former president had throat cancer, and he died on July 23, 1885.

## Grassy Narrows

THE SEVERAL hundred Ojibwa people in the community of Grassy Narrows in Ontario, Canada, became the victims of mercury poisoning from a nearby paper mill. Despite the known hazards of mercury, neither the provincial government nor the mill made any effort to protect the Native Americans until significant irreparable damage to the economy and the people had occurred.

The dangers of mercury have been suspected for centuries. Workers who used mercury, such as those who made hats, often appeared to go mad. This chemical element, found in nature, causes violent tremors, manic-depressive behavior, and temperamental instability. The manufacturing plants that served the pulp and paper industry were the biggest users of mercury prior to 1970. The chemical played an integral role in the electrolytic produc-

tion of caustic soda and chlorine (paper dyes). The plants released great amounts of mercury both in wastewater and exhaust gases.

Mercury in water is far more dangerous than mercury in the air. In bodies of water, a phenomenon takes place whereby inorganic (or metallic) mercury settles into the sediment and is transformed into the much more toxic form, or organic (or methyl) mercury, by a process known as biomethylation. Microorganisms living in the sediment protect themselves by converting inorganic mercury into methyl mercury, which is considerably less toxic to them. Methyl mercury then moves up the food chain as larger organisms consume small organisms. Once inorganic mercury has been added to a water system, it takes decades or more to clear.

#### MERCURY POISONING

When a person consumes a fish that is full of methyl mercury, the chemical is carried by the blood through body tissues. It concentrates in the heart, intestine, liver, and kidneys. Most of the clinical symptoms of mercury poisoning are related to brain and nerve lesions. Mercury destroys cells in the cerebellum, which regulates balance, and the cortex, which influences vision, as well as the frontal lobe, where it may cause disturbances in personality.

Swedish scientists established that abnormally high levels of mercury found in fish and wildlife were related to upstream pulp and paper plants. In 1966, the World Health Organization informed the Canadian Department of Health and Welfare that mercury could be a serious health hazard. In 1969, a University of Western Ontario study confirmed that fish taken downriver carried body burdens of mercury that were sometimes more than 40 times the standard set for export and human consumption. Federal officials did nothing. Finally, in 1970, the Ontario Minister of Energy and Resource Management ordered all companies in the province with substantial industrial mercury losses to stop discharging mercury into the environment. In that same year, Ontario banned commercial fishing on all lakes and tributaries of the English-Wabigoon river system.

One of these companies affected by the discharge ban was Dryden Chemicals Limited, a subsidiary of Reed Paper Limited. Between March 1962 and October 1975, Dryden operated a mercur-

ry cathode chlor-alkali chemical plant that produced chlorine and other chemicals for bleach in the adjacent pulp and paper mill of Reed Paper. During that period, scientists estimated that about 40,000 pounds of inorganic mercury entered the environment with about half of the amount going into the river system. In 1970, treatment systems were installed to isolate the heavy metal in the effluent. Although this resulted in a significant decline in the amount of mercury discharged, aerial emissions continued unabated. The release of mercury finally ended in 1975 when Dryden changed its technology.

Throughout the 1970s, Dryden executives denied any culpability for the mercury contamination of the English-Wabigoon. They initially insisted that mercury occurs naturally in the environment of the Canadian Shield and then shifted to a defense of ignorance of the process of biomethylation. Dryden's strongest line of defense was marshaled around the idea that the company had a sort of license to pollute from the Ontario government because it had followed Ontario environmental regulations and standards. The Ontario government attempted in the early 1970s to make compensatory payments to 19 Grassy Narrows fishermen. These "forgivable loans" averaged only \$311.08 per person with the total compensation paid to the community amounting to only \$5,910.

The impact of the mercury upon Grassy Narrows has been significant. Many of the Ojibwa made their living through commercial fishing or as fishing guides for tourists. Both the fishing industry and the tourism industry in the English-Wabigoon watershed collapsed. Fish also served as an important source of protein in the diet of the Ojibwas, especially for families too poor to purchase meat. Besides the collapse of a way of life, the mercury damaged the bodies of the Ojibwa and took away their hope of a future. Violent outbursts have become common among the Indians as have clumsiness, depression, and apathy. The Ojibwa now have such significant mental health problems that Grassy Narrows has become a place where suicide and violent death are the norm.

## Great Electrical Equipment Conspiracy

IN SEPTEMBER 1959, the U.S. Senate began committee hearings into allegations that the largest electrical-equipment makers in the United States were conspiring to fix prices. Among the manufacturers were major providers General Electric, Westinghouse, Allis Chalmers, Federal Pacific Electric, and smaller companies including ITE Circuit Breakers, AB Chance, Southern States Electric, and Cutler Hammer.

Since the 1940s, General Electric had feared competition—and had already accrued a long list of violations. In 1950, the company began to work to minimize competition and preserve its share of the market, and the other companies cooperated with the industry leader. General Electric dominated the heavy electrical equipment markets, with a market share of 40 to 45 percent. Westinghouse was next with 30 to 35 percent, and Allis-Chalmers and Federal Pacific each had 10 percent. During the 1950s, sales of heavy equipment brought these four companies an average \$1.75 billion a year.

That was too much of a temptation for executives under pressure to maximize profits and hold market share. Thus, leaders of the companies colluded to fix prices on turbines, switchgear, and other heavy equipment that they sold to the various governments.

Although the practice went on for years, the investigation began only when the Tennessee Valley Authority (TVA) noticed that it had been receiving identical bids from 47 manufacturers for three years. The bids were supposed to be secret, but the dollars were identical. Other government agencies—at the state, local, federal levels—had the same experience, but TVA was the first to disclose it. The TVA had a huge stake in the outcome because it had the largest electrical generating capacity in the United States and was a massive purchaser of

electrical power equipment. Tennessee was also home to Senator Estes Kefauver, chair of the Senate Subcommittee on Antitrust Activities.

The investigation revealed that the companies had worked together for some time to divide the market in line with the market shares each company had at the onset. Executives met secretly to discuss bids, leading all companies to tender exactly the same dollar bid. For instance, when the TVA asked for bids on 4,200 insulators, it received eight bids—all for exactly \$12,936.

The process was simple: Chiefs of various divisions of the companies would meet at public locations, such as sporting events or country clubs, and would establish the amount of the winning bid, the mid-range bid that most would offer, and a low bid for each solicitation under the government sealed bid process. To avoid charges of price fixing, the officials would not assign winning bidders. That would be determined under a pre-arranged schedule, with the winner rotating on the phases of the moon.

The bids could be significant. In one case, the colluded bid was \$198,438.24, and the winner undercut seven identical bids. Over time, each company maintained its market share. The strategy worked for decades until the coincidence in prices brought on an investigation. It is estimated that the conspiracy cost taxpayers \$175 million for each year of its existence.

Federal indictments came down in June 1960. More than 50 executives pleaded guilty or no contest and received large fines. Most individuals received prison sentences, later suspended. Many, naturally, lost their jobs. Seven vice presidents and division general managers at General Electric, Westinghouse, and two smaller companies served 60-day prison sentences. GE received a fine of \$437,500, and two executives went to jail for 30 days after paying fines of \$16,500.

The case was significant as the first to send corporate leaders to prison for violating the price-fixing ban of the Sherman Antitrust Act of 1890, 70 years after its enactment.

Even after the Great Electrical Equipment Conspiracy, companies were disinclined to compete. General Electric took a more subtle approach to avoiding price competition: It advertised its prices, fixed and non-negotiable, and promised to sell at no lower prices, not undercutting competitors. It also promised to refund differences if its prices became

lower. Westinghouse tested the GE pricing strategy by lowering its prices; when GE gave rebates to match the Westinghouse prices, the industry knew that prices would be stable. Competitors adjusted their prices to match GE, and for more than a decade after that prices remained stable, as did profit margins and market shares.

## Greece

WHITE-COLLAR and organized criminal activities are well established throughout Greece. Tax evasion, embezzlement of company funds, and the sale of fictitious insurance plans are examples of financial crimes conducted by white-collar criminals in the ancient nation. White-collar criminals also generate illicit funds through check, credit card, insurance and securities fraud, and embezzlement. The illicit profits garnered by white-collar criminals are routinely transferred through a variety of banking and non-banking institutions

For example, casinos, once nationalized, are now privatized, and create a potential vulnerability for money laundering. Additionally, Greek government bonds are held anonymously, purchased in cash, and ownership reporting is not required, so long as the value of the bonds remains under an approximately \$15,000 threshold. Domestic media reports routinely link Greek organized criminal gangs to a variety of illicit activities, including drug traf-

ficking, prostitution, arms smuggling, blackmail and gambling activities. The lack of a strong anti-money laundering regime also attracts foreign-based organized criminal gangs to Greece. Since the mid-1990s, a host of foreign criminal groups, including Albanian, Italian and Russian gangs entered Greece to establish a base for criminal activities.

Greece is not a major global money laundering center, but the country has considerable regional importance, due to its geographic position in relationship to the Middle East, the Balkans, and membership in the European Union. The civil strife in the Balkans, major drug trafficking and illicit smuggling through Albania and Kosovo, a range of criminal activities in Bulgaria, and drug trafficking out of Turkey provide opportunities for Greece to be a regional center for narcotics trafficking. Domestic and foreign gangs generate annual profits of \$11.5 billion within the country. Organized criminal groups allegedly launder illicit funds through the Greek stock market, casinos, and, in some cases, banks.

The Greek stock exchange is allegedly a vehicle for laundering illicit proceeds raised by domestic and foreign-based criminal gangs. For instance, in March 2000, local Greek criminal gangs reportedly engaged in extensive money laundering of funds raised through extortion schemes through the Athens stock exchange and Athenian banks. The transfer of illicit profits is also facilitated by the nexus between individual Greek businessmen, and organized criminal gangs.

For instance, a hotel complex on the island of Kos allegedly generated nearly \$800,000 through a narcotics smuggling partnership between Greek citizens and Colombian traffickers. Illicit profits were laundered through the Greek stock exchange and banking institutions in Greece and Switzerland. Media reports also allegedly link organized criminal gangs to the Greek shipping industry. From 1999–2003, there were public accounts in Greece of ongoing investigations by Greece's drug squad of large, multi-ton cocaine smuggling operations involving Greek ships.

The immense funds generated by domestic and foreign-based criminal networks results in bribes that corrupt political and law enforcement officials. International narcotics traffickers have reportedly infiltrated Greek law enforcement agencies. For example, a recent scandal resulted in the prosecution of seven anti-narcotics unit members of Greece's

National Police Force for aiding Colombian narcotics traffickers.

The growth of domestic gangs and the influx of foreign-based criminal groups throughout the late 1980s and early 1990s are directly linked to the lack of a stringent anti-money-laundering policy regime in Greece. The increase in criminal activity in Greece attracted the attention of the European Union (EU). To maintain the status of an EU member state, Greece was required to increase efforts against domestic and international criminal gangs.

In response to pressure from the EU, Greece adopted anti-money-laundering legislation in 1993. The law, however, was deemed inadequate by the EU. In 1995, Greece amended the legislation to meet international standards. Most importantly, the 1995 law obligated all Greek financial institutions to comply with provisions to combat money laundering, including broker dealers, credit institutions, mutual fund managers, and members of the Athens Stock Exchange, foreign exchange houses, insurance companies, and branches of financial institutions, which have their main offices overseas.

The punishment for each money-laundering offense is imprisonment for up to ten years. A lesser offense of concealing money laundering, which would apply, for example, to an officer of a bank who knowingly conceals information pertaining to laundered funds, is punishable by a minimum prison sentence of two years, extending to up to 10 years if it amounts to aiding and abetting or receiving laundered funds.

Increased legislative, regulatory and enforcement efforts resulted in a significant reduction of financial institutions linked to illicit finance schemes. The Greek public prosecutor stated in February 2001 that money laundering was migrating from the Athens Stock Exchange to the real estate market in Greece, stating that the enforcement efforts aimed at the exchange was causing the illicit profits to seek a less regulated sector. Increased enforcement efforts also limited the transfer of illicit proceeds through the Greek banking sector.

To avoid detection, organized criminal groups increased the trafficking of illicit proceeds through couriers to neighboring states. As a result, the funneling of illicit assets through alternative financial mechanisms indicates that recent measures by the Greek authorities are limiting the financial streams available to white-collar and organized criminal groups.

TRIFIN ROULE

JOURNAL OF MONEY LAUNDERING CONTROL

## Green, Mark J. (1945–)

MARK GREEN HAS served as New York City's consumer affairs commissioner and public advocate. He is the author or editor of numerous books on government, business, and consumer issues, including *Who Runs Congress?* (1972), *Corporate Power in America* (1973), *Winning Back America* (1982), and *The Consumer Bible* (1995). His most recent book, *Selling Out* (2002), focuses on how corporate money corrupts elections in America.

Green has spent most of his career exposing the crimes and misdeeds of large businesses. After graduating from Harvard Law School, Green worked with Ralph Nader from 1970 to 1980 as a public interest lawyer, ultimately becoming head of the Public Citizen's Congress Watch. From 1990 to 1993, he served as Consumer Affairs Commissioner, leading a \$17-million agency that handled 23,000 consumer complaints annually.

Agency initiatives included investigating how minority consumers were forced to pay more for groceries, auto insurance, and home improvement contracts; laundries and hair salons engaged in gender-price discrimination by charging women more than men; and tobacco companies targeted children in their marketing efforts. Green also helped garner support for a new law that banned cigarette vending machines.

Green was elected as the first New York City public advocate in 1994 and served for two terms. He was an early critic of the New York Police Department's (NYPD) failure to discipline abusive cops, and he won a lawsuit against the NYPD for

blocking access to internal files on the disciplinary process. Green co-authored New York City's landmark campaign finance reform law. He was also active in curbing healthcare abuses, hospital non-compliance with limits on resident working hours, and nursing-home health violations. His initiative to improve the child welfare system was a semi-finalist in the Innovations of American Government awards.

#### MAKE DONATIONS

Discussing the problems that arise when local corporations dominate community affairs, Green has asserted that "specific government compulsions" are needed "to stop industrial pollution, to assure racial freedom, to encourage local investment, and to reduce corporate economic and political power." To remedy the abuse of corporate power, he has suggested that corporations should make donations to community boards, which could then decide where to best allocate the money.

Green has argued that American democracy is threatened by the way that corporate money dominates the political culture. He described how stock values plummeted in 2002 "due to lost investor and consumer confidence because of how Congress had been shut-eyed sentries for years when it came to corporate crime." He insisted that the integrity of the nation's political system must be restored before citizens would be willing to invest deeply in the financial system.

Green was the 2001 Democratic nominee for the office of mayor of New York City, but he lost to opponent Michael Bloomberg. In 2003, he was a visiting lecturer at the New York University Law School and president of the New Democracy Project, an urban affairs institute.

ROBIN O'SULLIVAN  
UNIVERSITY OF SOUTHERN MAINE

## greenmail

GREENMAIL IS the practice of buying back raiders' shares at a higher market price in order to block a hostile takeover. R. Edward Freeman and colleagues (1987) distinguished between the threat condition for greenmail and the compliance condition. The threat condition to the holding company consists of the greenmailer threatening to engage in a hostile takeover of a company unless the management buys back the greenmailer's stock at a premium.

The compliance condition is simply that the management is forced to buy back or repurchase greenmailer's stock holdings at a costly premium. This distinction allows us to consider the morality of greenmail under two basic heads: The criminality of the threat of greenmail, and the morality of exacting compliance.

Managers' behavior is most often dictated by career concerns. They value their esteemed positions because of the goods they can enjoy in their managerial position. Hostile takeovers are not usually favorable to the interest of labor as stakeholder, and hence it may be of considerable importance that labor have some say when defense mechanisms or greenmail payments are considered. Paying greenmail enables management to guard their interest while further providing job security, whereas other stakeholders are vulnerable to takeovers and have little means of being empowered during such attempts. Therefore, there may be particular cases where an exorbitant amount is paid out to save management jobs, and the cost of making greenmail payments is absorbed by employees being given lower wages than otherwise expected.

Greenmail is one of the mechanisms used by top management teams to defend their companies against hostile takeovers. This term refers to a type of transaction in which corporations' repurchase a block of stock from a dissident stockholder declaring himself a takeover contender to top management's control position. Hostile acquisitions of a corporation amounts to a short-term tactic for immediate financial gains for the contending force. In general, making greenmail payments to the aggressing force generally causes a drop in the stock price of the repurchasing firm.

The commonly accepted theory is that paying greenmail exemplifies entrenched management protocol and harms shareholders (an example of

agency theory). Stockholders' rights activists concerned with the adoption of corporate governance best practices have been vigorously opposed to greenmailing asserting that the process deprives the shareholders any potential of economic benefits created by a "clean" takeover.

A contradictory theory in the debate suggests the opposite effect to greenmailing outcomes. The assertion is that greenmail payments benefit shareholders by providing flexibility to management. If this theory is true, the absolute prohibition of greenmail would reduce the value of a company's stock entirely. In pursuit of a company acquisition, the action does not go un-noticed by investors, who view the takeover attempt action to designate the company shares as decreasing in value, and the undervaluing of shares creates a chain reaction leading to sharp and sudden value in the company being acquired. The resulting undervalued shares are quickly acquired by the dissident stockholder at less than fair market value. However, what stock (at the newer undervalued price) is available to the takeover entity is not also available to the other shareholders. Thus, the other shareholders, once locked out from repurchasing undervalued shares, will instead see the takeover entities receiving a significant premium above the current market price.

Greenmail can actually benefit shareholders. It can solve otherwise insuperable transaction cost problems shareholders would face in fending off an unwanted or unduly low takeover bids. By doing so, it also facilitates the initiation of an auction for the firm's shares, a particular benefit in firms whose primary products are infrequently traded, making their value more difficult for shareholders to ascertain.

For example, the targeted repurchase of Saul Steinberg's shares by Walt Disney Productions in 1984 illustrates how greenmail can work to shareholders' benefit. In this case, even as greenmail was paid, incumbent management was given to understand that this could have no entrenching effect. Greenmail was needed to induce the first bidder to depart, before other takeover bidders quickly appeared. The time gained by the greenmail allowed the board time to restructure firm management.

Some states had adopted some type of statutory takeover controls as of mid-1992. One of the most popular forms of takeover regulation techniques is the anti-greenmail laws. These statutes block the discriminatory repurchase of a specified

percentage of a company's shares at a premium-to-market price from an investor who has held shares for less than a statutory minimum amount of time. These laws do not restrict repurchases where the transaction is approved by shareholders or the same offer is made to all shareholders. States with laws restricting the payment of greenmail include: Arizona, Nevada, Tennessee, Michigan, New York, Wisconsin, and Minnesota. An effective corporate board of directors would be expected to disapprove of a greenmail transaction that only served top management's interest in securing its control position.

## Greenpeace

GREENPEACE IS A non-governmental organization (NGO) that was established in 1971 to campaign for sustainable development and good environmental management, and against practices considered to be inimical to its goals. The original stimulus to create the group was to protest against the underground testing of nuclear devices by the U.S. government at the island of Amchitka off the coast of Alaska.

The method of protesting was to provide witnesses to activities that would otherwise have remained secret, alerting media, and attracting cover-

age. In some cases, passive physical resistance has been used, for example by placing small unarmed boats in the way of vessels believed to be carrying nuclear fuels. The activities and causes championed by Greenpeace have been so popular that it has become a worldwide organization, with a presence in 41 countries and nearly three million members. This has brought the group and its members into conflict with both governments and the private sector. Perhaps the most notorious incident occurred when the Greenpeace vessel *Rainbow Warrior*, which had been actively monitoring the activities of French troops and officials involved with testing of nuclear devices in the South Pacific, was boarded and sunk by French special forces, with loss of life.

In recent years, the deregulation of much business activity in many countries of the world, in combination with the forces of globalization that have made truly integrated international activities much more possible, has greatly broadened the scope Greenpeace activities. These include protesting international transportation of nuclear and other types of waste, the introduction of genetically modified organisms, and attempts to develop new weapons systems.

More longstanding campaigns confront whaling and pirate fishing, environmental degradation, and mismanagement, and examination of potentially hazardous chemical processes. Successful campaigns have resulted in the Basel Convention banning the export of hazardous wastes from countries, the establishment of an Antarctic whale sanctuary and an European Union (EU) decision to phase out driftnets.

The relaxation of regulations and the use of heightened security tensions by the United States and other governments restricting civil liberties have opened a number of new threats to Greenpeace's agenda. In 1999, for example, Greenpeace bank accounts were frozen in the United Kingdom (UK) and its vessels ordered to leave UK waters in response to the activities of the Greenpeace ship, the *MV Sirius* that had blocked the departure of two ships transporting nuclear matter to Japan. In August 2001, 17 people, including 15 Greenpeace activists, were charged with felony offenses for conspiracy and threatened with lengthy jail terms for protesting against the testing of the Star Wars missile program.

Revenue Canada (internal revenue), meanwhile, refused charitable status to Greenpeace Environ-

mental Foundation, claiming that it served no useful purpose and that its campaigns against corporations could put people out of work. These examples have been seen as part of a concerted international attempt to suppress NGO protests.

As an organization, Greenpeace has been extremely successful in raising the profile of environmental issues and has been invited to join international conferences at the highest level. Greenpeace, like other NGOs, such as Amnesty International and Friends of the Earth, have helped to change people's understanding of democracy and of how they can effect change.

## grifters

CONFIDENCE MEN and grifters have always been part of society, but they are perhaps most identified in the 19th century with the circus grifter and the riverboat gambler, and in the early 20th, with the world of the Big Con games, most famously portrayed in the 1973 movie, *The Sting*, and later the 1990 movie, *The Grifters*.

The world of the traveling circus was tailor-made for the con men, including the shell-game artists and other fraudsters. The circus management cultivated this relationship, providing their midway as a venue, and a fixer to avoid arrest, all in exchange for a cut of the profits. Mississippi riverboats and the transcontinental railroad construction camps, justly famous for nurturing gambling and vice, were also fertile ground for grifters, a life detailed by George Devol in his memoir *Forty Years a Gambler on the Mississippi*. However, not all gam-

blers were grifters, and not all grifters were gamblers. David Maurer, a linguist who studied the con argot, defines grifter: "In the strict sense, one who lives by his wits as contrasted to the heavy-men who use violence," and further, identifies grifters as "professionals within the criminal world." The grift (noun) is defined by Maurer as "a racket or criminal profession or group of criminal professions which employ skill rather than violence." The grift might also be used to connote a fraternity of professional swindlers who relied on their wits.

A grifter did not simply cheat at cards, he went out of his way to concoct a scheme to entice a pre-vetted mark (victim) into a crooked (fixed) game at which the mark would be fleeced (relieved of funds), and followed up with a carefully rehearsed brush off (exit strategy), to put the mark off the trail.

Legendary con man Ben Marks is credited with developing the concept of the Dollar Store, or a fixed location at which to play-out these schemes, at a "hell-on-wheels" construction camp attached to the Union Pacific Railroad in 1869. Transformed into the Big Store, this basic concept led to increased specialization and efficiency in the world of the grifters. The big store could be any kind of fake establishment: betting parlor, horse parlor, stock brokerage, or office used to swindle a series of victims.

While late-19th-century grifters were commonly associated with the circus, by the first quarter of the 20th century, most of the grift fraternity was associated with the Big Stores operating in New York City, Chicago, Illinois, and a host of other congenial cities where the police and political establishment could be fixed. These included Los Angeles, California; St. Louis, Missouri; Hot Springs, Arkansas; Des Moines, Iowa; Miami, Florida; and Denver, Colorado.

At each location, an insideman, or fixer, maintained a permanent operation, employing a loosely organized mob of grifters which often traveled from one location to another. In the mobs that operated out of New York and Chicago, and other cities in the first quarter of the 20th century, the grift fraternity included men and a few women who performed specialized functions, including ropers (recruiters), who traveled widely, enticing the marks into a carefully scripted play, organized by the insidemen and the shills or "sticks," the supporting cast of players known collectively as the boost. In

practice, the boost was often made up on the spot by any roper in town at the time. It was this itinerant, specialized, professional fraternity which defined the grifter in the beginning of the century.

In contemporary usage, the term *grifter* is applied to any form of swindler or participant in schemes to defraud. Today's grifters range from the still-independent (though far fewer in number) freelance con artists to internet fraudsters pulling scams via e-mail.

## Gulf Oil Corporation

THE U.S.-BASED Gulf Oil Corporation, formed in 1907, was the subject of major scandals about illegal campaign donations in 1973, and payoffs to foreign government officials in 1976. These revelations, and similar revelations about other major U.S. corporations, prompted public outcries about corporate behavior that led to the 1974 amendments of the Federal Election Campaign Act and the passage of the Foreign Corrupt Practices Act in 1977.

The origins of Gulf can be traced to the J.M. Guffey Petroleum Company established in 1901 to develop the Spindletop Oilfield in Texas. The founders of the company created the Gulf Refining Company to refine and market oil from Spindletop. In 1907, the two companies merged to form Gulf with noted capitalist Andrew W. Mellon as president.

For two decades, Gulf grew steadily, developing oil fields in Texas, Oklahoma, Louisiana, Mexico,

and Venezuela, and constructing pipelines linking these fields to four new U.S. refineries.

Investigators discovered that Gulf had made a series of illegal campaign contributions, including \$100,000 to President Richard Nixon's Committee for the Re-Election of the President (CREEP), and other donations of \$15,000 and \$10,000 to a representative of other candidates in 1972. In November 1973, Gulf pleaded guilty to making illegal contributions to the Nixon campaign totalling \$125,000.

The Watergate hearings prompted the newly formed Enforcement Division of the U.S. Securities and Exchange Commission (SEC) to investigate how Gulf and eight other corporations concealed their illegal contributions to the Nixon campaign. In 1975, the SEC prosecuted Gulf after discovering that the company operated a secret slush fund, laundering money through a Bahamian subsidiary. Gulf agreed to appoint a committee to investigate all political payments made by the company.

The Special Review Committee, chaired by the New York lawyer John J. McCloy, reported in December 1975. The report revealed that Gulf spent \$10.3 million on contributions, gifts, entertainments, and other expenses relating to political activities in the United States and abroad, including \$4 million given to the political party of South Korean President Park Chung Hee. As a consequence of the report, the Gulf board of directors demanded the resignations of their chairman and three other executives in January 1976.

The scandals added considerably to Gulf's existing woes about oil supplies. In 1975, the Kuwaiti

government nationalized Gulf's operations in that country. The scandal forced several key managers to resign, weakening Gulf's senior management at a time of crisis. Cautious, bureaucratic, and lacking in confidence, their successors did not provide clear and aggressive leadership required to improve the company's position. Gulf became a prime takeover target.

In 1983, T. Boone Pickens attempted to seize control of Gulf, but Gulf executives resisted Boone's takeover. In an attempt to save the company from being broken up, the board invited rival takeover bids. In 1984, the Gulf board agreed to sell the company to Chevron for \$13.2 billion.

## Hart-Scott-Rodino Act

AMENDING THE Clayton Act of 1914 (which covers stock acquisition in restraint of trade), the Hart-Scott-Rodino Antitrust Improvements Act of 1976 (HSR) (15 U.S.C. 18a) requires that certain proposed mergers of assets be approved beforehand by the Federal Trade Commission (FTC) and the Antitrust Division of the U.S. Department of Justice, the antitrust authorities in the United States.

Calls for legislation covered by HSR date back to the Dwight Eisenhower administration in the 1950s and Attorney General Robert Kennedy in the early 1960s. Prior to HSR, unfair restraint of trade related to stock acquisition could be prosecuted only after a restraint was found. The first set of rules became effective on July 31, 1978, and has been amended by both antitrust authorities numerous times to improve the program's operations and lessen the paperwork burdens of filing.

Those subject to filing proposed mergers must generally wait 30 days (15 days for cash tender offers and bankruptcy sales) for the antitrust authorities to determine whether the intended merger will adversely affect a marketplace. Whether a given acquisition is subject to HSR depends on its value, and, in some cases, the size of the parties measured by their assets or sales. If either antitrust authority

believes that more information is needed to investigate the application, it can extend the 30-day period for another 30 days (10 days for cash tenders and bankruptcy sales), and require a second request for pre-merger documentation. About 3 percent of all proposed mergers involve a second request. When the government believes that a marketplace will be adversely affected—either by increasing consumer prices or decreasing the quality of consumer products or services—it will request in federal court an injunction against the merger.

On February 1, 2001, major changes to HSR took place, including raising the acquisition value for reporting pre-merger activities from greater than \$15 million (in acquired assets or voting rights) to greater than \$50 million; this threshold also applies to acquisition of foreign assets and voting rights). A much more expensive fee structure was created—\$45,000 for transactions valued at less than \$100 million, \$125,000 for transactions valued at \$100 million to less than \$500 million, and \$280,000 for transactions valued at \$500 million or more. The 2001 amendment also contained other technical changes in requirements for HSR reporting.

Beginning in 2005, the minimum acquisition value is adjusted by the percentage increase or decrease in the “gross national product” from the previous year. The 2001 change immediately led to a 50 percent decline in the number of premerger investi-

gations (from 4,926 in 2000 to 2,376 in 2001). Although the number of pre-merger investigations declined substantially, the government still reviews the largest proposed mergers ever, some of which have involved multiple trillions of dollars. Reports of pre-merger stoppages are published annually by the Federal Trade Commission in its *FTC HSR Annual Report to Congress*, mandated by 15 U.S.C. 18a(7A)(j).

To find pre-merger situations that violate the act based on failures to file an HSR report, the antitrust authorities examine newspaper and industry publications, and rely on complaints from consumers, stockholders, and competitors. Failure to file a required HSR report carries a fine of \$11,000 per day. Opponents of HSR claim that the exorbitant fees required charge businesses for services they do not want, and are analogous to fines levied against businesses for crimes they have not committed.

## Hartung-Burgess Debate

SHORTLY AFTER Edwin H. Sutherland helped introduce the world of criminology to the topic of white-collar crime, a number of pioneering research studies soon followed. In their own unique way, each of these studies attempted to resolve the definitional controversies surrounding the white-collar crime concept.

Some criminological researchers sought to refine Sutherland's early definition by narrowing the scope of white-collar crime and focusing on a limited number of offenses. Comparatively, other criminologists took the concept of white-collar crime and tried to expand it, arguing that the term could

apply to even a greater number of offenders and offenses.

Beginning with the pioneering work of Sutherland, early criminologists recognized that white-collar crime is difficult to study, regardless of how it is defined. While researchers focusing on violent or common crimes had several official sources of data (such as the Uniform Crime Reports and other police documents) available for use in their research, those studying white-collar crime were not afforded such a luxury. Given the difficulties associated with obtaining representative, white-collar crime data, many researchers following Sutherland turned to a relatively new approach: the case study. Unlike the more traditional, positivistic approach to social science and criminological research whereby a large sample of offenders is used to test theory and make limited inferences about some phenomenon, the case study is based on a detailed examination of a single case.

#### OFFENSES AND OFFENDERS

Taking the case study to the industry level, criminologist Frank E. Hartung focused his white-collar crime research on the Detroit, Michigan, meatpacking industry during World War II. In his attempts to address the ongoing definitional debates of the time, Hartung examined offenses as well as offenders. He questioned whether violations of wartime regulations could be considered white-collar crime, and argued that they could. As a result, he also questioned whether those offenders who committed the violations could be viewed as white-collar criminals. Hartung's resulting opinion on this issue was also affirmative, based on the evidence from his research.

Among other criminologists studying white-collar crime, Hartung's research was welcomed as major contribution to the literature. However, it drew considerable criticism from one of the most prominent sociologists of the time: Ernest W. Burgess. A well-known and respected Chicago School researcher, Burgess maintained that wartime regulatory violations were not white-collar crime. Similarly, he argued that the individuals who committed such acts were not white-collar criminals because they did not view themselves as criminals.

Burgess also attacked the validity of Hartung's research by stating that well over half of Americans were likely involved in wartime regulatory viola-

tions, and that it would be impossible that such a large segment of the population could not all be viewed as criminals. Hartung, and other scholars, had understandable difficulty with Burgess' proposition that a person is not a criminal if she does not view herself in that light. However, Hartung's research arguably made a contribution to the study of white-collar crime, and subsequent criminologists followed his lead in conducting in-depth studies of specific industries.

## Hays, Wayne (1911–1989)

IN MAY, 1976, Wayne Hays, a 14-term Democratic Congressman from Ohio, was considered one of the most powerful members of the U.S. House of Representatives. As chairman of the House Administration Committee, he controlled members' campaign funds and office allowances. He also became the center of intense controversy when the *Washington Post* published a story alleging that Hays placed his mistress in a \$14,000-a-year staff job with the House Oversight Subcommittee in exchange for sexual favors.

Hays acknowledged that he had a "personal relationship" with the woman but claimed that there had been nothing illegal about her employment. He insisted that she was paid for work actually performed by the subcommittee. The Department of Justice immediately began investigating the matter for possible violations of federal laws covering conspiracies to defraud the government or to convert public funds to private use. The woman, apparently reveling in her sudden notoriety, became a favorite

interview subject for inquisitive reporters. She effectively refuted Hays' claim that she was a valuable employee when she admitted that she did not know how to take dictation, or type, or even answer the telephone in her "office." Five months after the story broke, Hays resigned from Congress. The Justice Department quickly dropped its investigation, as did the House Ethics Committee, which had also been looking into the matter. In October 1976, a federal judge, at the request of the Justice Department, threw out of court three suits brought against Hays by taxpayers seeking to recover the public funds used to pay the salary of Hays's mistress. Hays died in 1989.

## hazardous waste

HAZARDOUS WASTE is industrial waste that the Environmental Protection Agency (EPA) designates as dangerous to the environment or the public health. The EPA mandates that hazardous waste be managed and disposed of using specific methods. There are five methods used to treat hazardous waste including being deposited in a deep well, a pond, a landfill, the ocean, or in an incinerator, detoxified, recycled, or reused.

Unfortunately, 68 percent of the hazardous waste in the United States is managed by disposal, 5 percent is burned, and 5 percent is recycled. Industrial facilities that produce hazardous waste are required to handle and store the waste properly and either treat it themselves, or transport it to other sites with legal permits to treat or dispose of the waste. Between 700,000 and 1 million hazardous-waste generating facilities exist in the United States.

These facilities produce 1.1 trillion pounds of hazardous waste. The EPA reported in 1990 that approximately 211,000 of these hazardous waste facilities were in direct violation of the Resource Conservation and Recovery Act.

Congress enacted the Resources Conservation and Recovery Act in 1976 to regulate hazardous waste generation, management, and disposal. Toxic waste-generating facilities or manufacturing companies are greater than the 2,025 facilities that exist to dispose or treat the waste. Additionally, it is quite common for many of these waste-generating facilities to perform illegal operations, such as the 22-percent of hazardous wastes that are discharged into streams and sewers. Facilities that specialize in the management, but not the generation of hazardous wastes, are called treatment, storage, or disposal facilities, or TSDFs, but they handle only about 2 percent of the hazardous waste produced. Most research examining hazardous waste has focused on these TSDFs that are under much more stringent legal standards than the facilities that generate the waste. Research examining TSDFs reveals that such facilities are more likely to be placed in areas with poor households or in predominantly minority areas.

### SUPERFUND

In 1980, the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) was enacted to clean up the most dangerous of discovered abandoned toxic waste sites. This act created the Superfund, bankrolled by special taxes on petroleum and chemical industries, which waived federal government sovereign immunity so states could sue the federal government. The CERCLA was amended in 1986 by the Superfund Amendments and Reauthorization Act (SARA) and mandated an inventory of all discovered potentially hazardous abandoned hazardous waste sites. Most of these are former manufacturing plants, mineral mines, federal ammunition dumps, chemical waste ponds, or municipal landfills; some of these were legal dump sites some illegal.

There are between 4,000 and 50,000 illegal hazardous sites created on a daily basis in the United States alone. According to the U.S. government, there are over 16,000 active landfills containing hazardous wastes and underground landfills in rural areas that will eventually breach and penetrate the

soil. Poor rural areas already contain thousands of landfills and underground storage sites that are already contaminated and leaking. Chemical wastes leach from disposal sites and leak into community water supplies. Specifically, the EPA reports that 74 percent of the Hazardous Waste Sites (HWS) are associated with groundwater, the primary source of drinking water in the United States.

This contamination primarily includes heavy metals and organic solids. These sites have been prioritized and ranked in terms of degree of dangerousness and subsequently end-up on the National Priorities List (NPL). As of 1997, this list contained 1,400 of the most dangerous HWS in the nation scheduled for cleanup. NPL sites are paid for by the previously collected fund from taxes on big business and EPA lawsuits against polluting companies. These are also called Superfund sites.

### CORPORATE CRIME

Environmental crimes often involve the use of organized crime syndicates to illegally manage the toxic waste produced by some of the nation's most frequent environmental offenders including, General Electric (GE), Westinghouse, Ford, DuPont, the U.S. government, and Union Carbide. Estimates indicate corporations illegally dump about 8 million tons of toxic wastes into rivers and costal waters annually. GE is responsible for hazardous waste contamination at more than 200 Superfund sites. The nation's most polluted site may be Rockwell International's facility that manufactures nuclear weapons in Rocky Flats, Colorado, where approximately 166 hazardous waste sites have been found.

Oil companies are chronic offenders and account for half of the hazardous waste problems across the country. Environmental crimes also involve the poisoning of the world's poorest peoples through use of U.S.-banned pesticides, in addition to the export of banned toxic waste to third world nations. David R. Simon points out that many of these environmental crimes go unreported by traditional media outlets. In the United States, there are more than 50,000 abandoned hazardous waste sites, and over 1,200 of these remain a risk to human health and have been placed on the NPL of the government's Superfund program.

Most of the 5,000 active hazardous waste sites are required to conduct extensive cleanups as mandated under the 1976 Resource Conservation and

Recovery Act. There are approximately 295,000 locations where hazardous waste is stored in leaky underground storage tanks that contaminate groundwater resources. The largest 100 of these hazardous waste facilities generated six times more hazardous wastes than the remaining facilities.

## LOVE CANAL

The worst hazardous waste crime in U.S. history occurred at the Love Canal site in western New York. Hooker Chemical and Plastics Company dumped approximately 27,000 tons of toxic and cancer-causing chemical waste into the canal from 1942 to 1953. Similarly, an abundance of research reveals that across the country, counties with hazardous waste sites have significantly higher mortality for lung, bladder, esophagus, stomach, large intestine and breast cancers than counties without hazardous waste sites.

During an excavation at Love Canal, the chemicals were discovered to be leaking from corroded drums into sewers, gardens, basements, and a playground contaminating over 900 homes and an elementary school. In 1979, the area was declared a federal disaster area by President Jimmy Carter. This environmental calamity resulted in the 1980 Comprehensive Environment Response and Comprehensive and Liability Act.

Hooker committed a similar offense in Hicksville, Long Island, New York, where its plastics manufacturing company produced and shipped the toxic solid waste released in the process of making plastic, called polyvinyl chloride (PVC) from 1946 to 1968. This substance causes liver cancer, degenerative bone disease, and respiratory problems. Basically, Hooker shipped 478,300 pounds of PVC from one municipal landfill to another. The waste eventually ended up at a landfill in Brentwood, New York, where it contaminated drinking wells belonging to Grumman Aerospace Corporation's plant adjacent to the landfill. Hooker also secretly dumped toxic waste stored in leaky barrels in White Lake, Michigan, resulting in birth defects, cancer, and sterility, among nearby residents. Hooker Chemical committed multiple additional environmental crimes prior to advent of environmental waste legislation.

Another problem with the disposal of hazardous wastes is the placement of facilities in predominantly poor or minority neighborhoods. One

*A "paint waste area" is shown in promotional materials for a waste clean-up company in Savannah, Georgia.*

government study found that newer TSDFs were more likely to be located in minority and lower-income neighborhoods, particularly in heavily populated urban areas, and that it is the smaller hazardous waste facility that is often more likely to illegally dispose of its waste. In response to this information, the EPA declared in 1994 that environmental equity would become one its top priorities. Subsequently, President Bill Clinton signed Executive Order 12898 requiring federal agencies to address environmental justice with regard to minority and poor communities.

## STUDY ASSESSMENTS

According to the EPA, 60 percent of hazardous waste received at the TSDFs is from another state and 80 percent at the county level is from another county. In 1997, the first piece of research aimed at studying a national tract-level analysis of equity in the distribution and prioritization of abandoned toxic waste sites was published. The research examined the differences in the demographic characteristics of neighborhoods with NPL sites and those with the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) sites not yet on the priority list.

This process is such that, after citizens or agents of the EPA (state or federal) discover a potential hazardous waste site, the EPA investigates and records the location of the site on the CERCLIS database. Once recorded, it is scheduled for prioritization review or investigation and possible listing on the NPL. After the investigation, sites deter-

mined to be harmless are removed from the CERCLIS. Those that are hazardous are scored by the Hazardous Ranking System assigning a score, indicating the level of risk involved. Sites with scores beyond a certain threshold are placed on the NPL, and are further investigated and then prioritized again for remediation by the specific environmental offender.

The research findings revealed that in densely populated metropolitan areas, neighborhoods with an average percentage of Hispanics (7 percent) and African-Americans (11 percent) were more likely to have increasing numbers of CERCLIS sites. CERCLIS neighborhoods were more likely to have fewer college-educated persons and more industrial workers living in the neighborhood. This was true in metropolitan and rural areas. Another fact is that every 1990 census-defined metropolitan area had at least one CERCLIS site located in it.

In examining whether or not inequity existed in the distribution of NPL sites, researchers found that poorer neighborhoods, neighborhoods with a greater percentage of Hispanics, African Americans, and poor people were less likely to end up on the NPL while more densely populated neighborhoods were more likely to end up on the NPL. Finally, on average CERCLIS locations are on the list for about 5.5 years from the time of discovery to placement on the NPL.

In a very sophisticated analysis by Douglas Anderton and John Michael Oakes found that as the percentage of African Americans and poor families increased the time associated between discovery and National Priority listing increases. Other research found that, in Florida, a higher percentage of African American and Hispanics were more likely to live near the site.

Further research found that, over time, the percentage of African Americans and Hispanics living in or near these Superfund sites increased from 1970 to 1990, supporting their indirect discrimination thesis. That is, African Americans are constrained to live in areas with diminished economic value as the result of adjacent NPL sites (most NPL sites in Florida were placed on the list in the late 1980s). Thus, the data indicate class and racial inequality is institutionalized into the construction and labeling of sites as Superfund sites or NPL sites. Proportionately, more white, better-educated neighborhoods are more likely to have hazardous waste sites in their areas more rapidly placed on the NPL

for clean up. It should be noted that NPLs were also more likely to be located in metropolitan areas, but then 75 percent of all NPLs are located in metropolitan areas. Interestingly, the average cost of cleanup at each NPL site is about \$27 million.

## INTERNATIONAL WASTE

Hazardous waste proliferation is becoming an international problem particularly among developing and third world nations. Specifically, the United States and European nations export toxic waste to developing nations to reduce costs and increase profits. This internationally institutionalized pattern of behavior is revealed by an internal memo written by an economist for the World Bank, suggesting exporting more toxic waste to peripheral nations. This environmental exploitation of poor, developing nations thus appears to motivated by the same considerations influencing the placement of polluting industries or toxic storage facilities in U.S. communities, that is, greater levels of poverty or economic inequality translate into lower costs for corporations and minimal enforcement standards, or the total absence of legal prohibitions.

For example, industries that produce hazardous waste, while required to meet certain environmental standards in Western industrialized nations, face regulations in developing nations that are lax, and where social protests against environmental degradation and pollution are weak or nonexistent. Thus, transnational corporations can act with impunity in damaging the land, water, and air in developing nations. More recently, transnationals have been able to sell their corporations' clean-up operations and profit from those sales, even though it was their industry that created the environmental problem in the first place. Moreover, the U.S. government's International Development Agency has given \$117 million to U.S. industries to aid in the environmental clean-ups in Asian, African, and South American countries. Although the 1989 and 1994 Basel Conventions banned waste trade (or dumping) between industrialized nations and third world nations beginning in 1997, it did not prevent the sale of such industries.

## Health Corporation of America

THE LARGEST FOR-PROFIT hospital chain in the United States, Hospital Corporation of America (HCA) runs more than 200 hospitals and surgical centers in 24 states, as well as operates holdings in both England and Switzerland. HCA had been under investigation by the U.S. Justice Department for years when on July 26, 2003, the Justice Department announced that HCA had agreed to pay the government \$631 million in civil penalties and damages for false claims to Medicare and Medicaid. Included in the charges against HCA were cost reporting frauds and payment of kickbacks to doctors.

"Health care providers and professionals hold a public trust, and when that trust is violated by fraud and abuse of program funds, and by the payment of kickbacks to the physicians on whom patients and programs rely for uncompromised medical judgment, health care for all Americans suffers," said

Assistant Attorney General Robert D. McCallum Jr., who headed in 2003 the Justice Department's civil division.

In December 2000, HCA subsidiaries pleaded guilty to criminal misconduct and paid \$840 million in fines, restitution, and penalties. In addition, HCA agreed to pay \$250 million to resolve overpayment claims in its cost-reporting practices. All together, the Justice Department recovered more than \$1.7 billion from HCA, the largest recovery ever in healthcare industry fraud investigation. This settlement covered nine fraud accusation lawsuits against HCA. The government claimed that HCA systematically defrauded federally funded health care programs, including Medicare and Medicaid. Eight whistleblowers, including a physician, filed suit in 1995 and will, as of 2003, receive \$157.6 million.

### THE UNINSURED

On July 16, 2003, the Consejo de Latinos Unidos released a report charging HCA with illegal collection practices against the uninsured, as well as systematically over-charging the uninsured by \$2.1 billion in 2002. "Let this case be a continuing reminder to all that in the fight against healthcare fraud this office will not be deterred," said Acting Principal Deputy Inspector General Dara Corrigan in 2003. "Medicare dollars paid to provide ever more expensive healthcare services to the country's taxpayers should never be fraudulently diverted. This is our job and our trust and we take these duties very seriously." Corrigan concluded.

The Department of Justice relates, in a separate agreement, HCA agreed to pay \$1.5 million to resolve allegations that an Atlanta, Georgia, hospital, West Paces Medical Center, paid kickbacks for the referral of diabetes patients. On July 21, 2003, HCA announced that it had finalized an agreement with states having claims similar to those of the Department of Justice. HCA will pay \$17.7 million to state Medicaid agencies to settle those claims, according to Health & Medicine Week.

## healthcare fraud

THREE BILLION DOLLARS are spent each day on healthcare in the United States, and over four billion healthcare insurance transactions are processed each year. Of these transactions, a small percentage of them are fraudulent. Estimates from the Centers for Medicare and Medicaid Services suggest the healthcare spending will account for 17 percent of the gross domestic product by 2011. When all is said and done, it is estimated that between \$39 and \$100 billion is lost to fraud and abuse in healthcare each year.

The Springfield, Illinois, division of the Federal Bureau of Investigation (FBI) in 2003 defined healthcare fraud as "knowingly executing or attempting to execute a scheme or artifice to defraud a health benefits or insurance program or the willful execution of a scheme to defraud a care recipient." A similar definition of healthcare fraud is offered by the National Healthcare Anti-Fraud Association (2003), which defined healthcare fraud as "the deliberate submittal of false claims to private health insurer plans and/or tax funded health insurance programs, such as Medicare or Medicaid."

State and federal governments began their attack on healthcare fraud in the early 1990s. In 1992, the Healthcare Fraud Unit was established by the FBI within its Financial Crimes Section. The unit is not designed to investigate crimes per se, but to provide support and assistance to field offices that are working on cases that may spread across the nation. A few years later, in 1995, Attorney General Janet Reno announced that the response to healthcare fraud would be "the number-one priority of the Department of Justice."

There are at least three related reasons why concern about fraud and abuse in the healthcare field escalated in the 1990s. First, increased costs in administering healthcare caused great alarm and

politicians, policy makers, and criminal justice officials recognized that a significant proportion of those costs were due to illegal activities. Second, legislative initiatives called for strict enforcement of criminal activities in the healthcare field. Third, significant changes in the enforcement strategies available to criminal justice officials allowed for increases in the number of healthcare fraud prosecutions.

The passage of the Health Insurance Portability and Accountability Act (HIPAA) of 1996 was one legislative initiative that allowed for stronger responses to healthcare fraud. The act created a specific criminal offense for healthcare fraud and added these offenses to money laundering statutes. In addition, the act allowed authorities to implement criminal forfeitures, meaning they could seize money, property, or other profits offenders gained from the healthcare offense. The act was also significant in that it strengthened the government's ability to "kick providers out" of various benefit programs if they committed healthcare fraud. HIPAA was backed up with a significant and constant amount of funding. Essentially, the government's power to respond to healthcare offenses expanded significantly under this act.

Perhaps the most significant aspect of HIPAA was that it required the attorney general and the Department of Health and Human Services to work together in creating the Healthcare Fraud and Abuse Control Program. The program was designed to coordinate federal, state, and local responses to healthcare fraud. The goals of the program were the following: punish offenders; deter others from misconduct; protect patients; protect the integrity of the Medicare Trust Fund; educate patients and providers; and foster communication among agencies. If the increases in healthcare fraud prosecutions are any indication, HIPAA certainly was a success.

To fully understand healthcare fraud, attention should be given to the types of healthcare fraud, the response to healthcare fraud, its consequences, and the future of healthcare fraud.

### TYPES OF HEALTHCARE FRAUD

Several different types of healthcare fraud are perpetrated against the healthcare system. A non-exhaustive list of these offenses includes the following: phantom billing; upcoding; performing unnecessary services; misrepresenting treatments;

double billing; unbundling; illegal kickbacks; and billing for services provided by untrained/unlicensed individuals. These offenses and examples of each are described below. Note that these offenses can be committed in just about any branch of healthcare.

*Phantom billing.* A provider bills for services that were never provided to the patient(s). Example: A doctor bills for numerous sonograms that were never given.

*Upcoding.* A provider bills for more extensive services than were actually provided to the patient(s). Example: A dentist bills for a root canal, but actually simply filled a cavity.

*Performing unnecessary services.* A healthcare provider provides services that the patient does not need. Example: A cosmetic surgeon performs a breast reduction and bills the insurer on the grounds that the services were medically necessary.

*Double billing.* A provider bills more than one agency or patient for services. Example: A home healthcare nurse bills Medicaid and the patient the same amount for the same services.

*Unbundling.* Services that are supposed to be covered as a package are billed separately. Example: A hospital bills for specific services for a pregnant woman that are supposed to be billed as a package.

*Illegal kickbacks.* Healthcare workers provide funds or services in exchange for referrals. Example: A nursing home pays a hospital discharge employee for referrals made to the nursing home.

*Billing for services provided by untrained/unlicensed providers.* Workers who are not authorized to perform certain services do so anyway. Example: An nurse provides services that are supposed to be provided by a doctor.

*Drug theft.* Healthcare workers steal medicine or supplies but bill the insurance company as if those were provided to patients. Example: A pharmacist steals codeine and bills Blue Cross/Blue Shield.

*Pingponging.* Providers refer patients to other healthcare services simply to do other providers a favor. Example: A general practitioner sends a patient to cardiologist when the additional services are not needed.

## CASE STUDIES

Sometimes it is clear that healthcare fraud has occurred. Here are a few examples, descriptions of recent healthcare fraud cases described in the *Health-*

*care Fraud Report* in which it was clear that inappropriate activity occurred:

Pennsylvania Blue Shield, the Medicare carrier for several mid-Atlantic states, resolved a 2-year investigation by agreeing to pay \$38.5 million in settlement of allegations that it improperly processed Medicare secondary payer claims, neglected to recover overpayments, bypassed certain computer payment safeguards, and failed to implement required screens for certain lab tests, all of which resulted in false claims to the Medicare program. Again, the contractor agreed to undertake corporate integrity obligations, including training and external reviews of its performance.

On February 27, 1998, in the Southern District of Mississippi, the owners of Gieger Transfer Services, an ambulance company, were sentenced to 80 months in prison and ordered to pay restitution of \$228,917 and a \$12,500 fine. The defendants billed Medicare \$400 per ambulance trip, claiming that patients taken on non-emergency ambulance trips were “bed confined” when, in fact, many could walk and had no need for ambulance transportation.

On February 20, 1998, in the Middle District of Florida, the owner/operator of the Tampa branch of the Florida Impotence Clinics, Inc., was sentenced to 27 months in prison and restitution of \$925,779. The defendant had pleaded guilty to having been engaged in a conspiracy to receive kickbacks for referrals to suppliers of diagnostic testing services. The owner received \$30 for any vacuum constrictor device used to treat impotence which was paid for by Medicare and sold by any clinic associated with the company.

Between July 8, 1997, and February 18, 1998, in the District of Massachusetts, six men were sentenced to various jail terms and ordered to pay \$3.5 million in restitution for defrauding eight non-profit mental healthcare companies that provided services to de-institutionalized mentally retarded individuals in six states and Washington, D.C. The men formed a fictitious management company to provide contract services to group homes for the mentally ill. The men received payments from the Medicare and Medicaid programs for services not rendered.

While wrongdoing was clearly established in each of these cases, whether activities are fraudulent or not is not always clear. The office of inspector general, for example, says that the following activi-

*Consequences of healthcare fraud include: 1) a loss of trust in healthcare officials, 2) inadequate healthcare, 3) deprivations of healthcare, and 4) physical harm from unnecessary services.*

ties are potentially unlawful: Hospitals paying incentives to physicians every time they send them patients; allowing doctors to use free or discounted space near a hospital; providing free or discounted services to services to physicians' staff; providing low-interest loans to physicians in exchange for referrals; providing free training for physicians' staff members.

Healthcare providers routinely claim that the vague nature of the statutes governing their activities makes it possible for authorities to become overzealous in enforcing healthcare fraud statutes. A consideration of the response to healthcare fraud can help determine whether enforcement can be characterized as overly aggressive.

#### RESPONSE TO HEALTHCARE FRAUD

Authorities control healthcare fraud in three different ways—through criminal remedies, civil processing, and administrative hearings. Yvette Mastin uses

the phrase *triple proceedings* to refer to the fact that providers could face proceedings in all three of the areas. Criminal justice processing of these cases increased dramatically in the mid-1990s. Changes in the way the FBI responded to healthcare fraud between 1992 and 1999 were dramatic. The number of FBI agents assigned to investigate healthcare fraud increased nearly fivefold in the 1990s, from 112 in 1992 to 500 in 1999. As a result, the number of criminal healthcare fraud investigations by the FBI increased from 502 to 3000, and the number of convictions from 116 to 548 between the same years.

It was not just the FBI, though, that was involved in the response to healthcare frauds. Others that are active include the following agencies: the United States Postal Service, the Internal Revenue Service, Defense Criminal Investigative Services, Medicaid Fraud Control Units across the states, the U.S. Attorney General, the Department of Public Health, and the office of inspector general. In addi-

tion, private insurers have their own investigation units designed to detect, prevent, and root out fraud in their agencies.

Investigators and prosecutors will face a number of obstacles when they bring criminal charges against healthcare providers. For instance, healthcare providers generally have a great deal of resources that allow them to hire the best attorneys who are able to put together the best defense possible. Investigators continue to face funding shortfalls and outdated computers that make their search for evidence cumbersome. They also must gather a plethora of records in order to substantiate that fraud occurred. According to Mark Taylor, the average healthcare fraud case “can entail 50 boxes of evidence, with each 1-foot-by-2-foot box containing 3,000 to 5,000 pages of information.” Having to sort through all of this evidence and find witnesses willing to talk about sensitive issues slows the criminal prosecution process.

Another problem that arises in criminal prosecutions of healthcare cases is one of proof. Prosecutors must prove beyond a reasonable doubt that a crime was committed. Providers routinely claim that the inappropriate billings were simply accidents committed by someone working in their billing office. It is an uphill battle to convince a judge or jury that the provider was responsible for the fraudulent claims submitted to the insurance company.

Despite these obstacles, criminal prosecutions have proven to be a success and a lucrative response to fraud. In terms of success, over half of offenders convicted of healthcare fraud at the federal level receive prison sentences. Also note that the Department of Justice was able to exclude 3,000 providers convicted of wrongdoing from participating in Medicare and Medicaid in 1998. In terms of the lucrative nature of the response to healthcare fraud, in 1998 the Department of Justice alone recovered nearly a half-billion dollars in its response to healthcare fraud.

Authorities will also rely on civil prosecutions to bolster the response to healthcare fraud. In these cases, the government essentially become the plaintiff and files suit against the defendants, who may be providers, businesses, or groups of organizations. Officials commonly file civil charges against providers under the False Claims Act. This act was created during the Civil War to help the government go after gunpowder manufacturers who were

wreaking havoc by selling sawdust instead of gunpowder. Today, the act is used to “create liability for defendants who act against the government by presenting, or through the presentation of, a false or fraudulent claim for payment or approval,” explains Mastin. In using this act, the plaintiffs do not have to prove that the provider intended to defraud the healthcare system; rather, they simply have to approve that the system was stolen from.

False Claim Act cases are also appealing because of their economic nature. Basically, providers can be ordered to pay treble damages, meaning that they

*A doctor's referral for unnecessary services or surgery constitutes healthcare fraud.*

have to pay three times that amount that they stole in addition to any fines they received on specific charges. This can represent an enormous “profit” for the government. In one case, for example, a pharmacist fraudulently obtained \$155 through 29 fraudulent bills. He was fined \$2,000 and his pharmacy was fined \$10,000. In another case, Fresenius Medical Care agreed to pay \$385 million to resolve accusations that the provider conspired to steal from Medicare. In all, the Department of Justice recovered \$2 billion through civil recoveries between 1986 and 1998. These figures are increasing: In 2001 alone, the Department of Justice brought in \$840 million in civil recoveries. Not surprisingly, healthcare fraud recoveries top the list in civil recoveries made by the federal government.

A growing number of civil cases against healthcare providers are the result of *qui tam* suits. In these lawsuits, which are also known as whistleblower suits, an individual not affiliated with the government files charges on behalf on the United States. The individual is given a percentage of the awards should the case result in a finding against the healthcare provider. While *qui tam* suits can be filed against virtually any type of business defrauding the government, half of all *qui tam* lawsuits involve accusations of healthcare fraud. They are seen as beneficial in that they help to identify activities that otherwise would go undetected.

The administrative response to healthcare fraud includes licensing agencies, state medical boards, insurance companies, or state or federal authorities which may hold hearings to determine whether wrongdoing occurred. The penalties that could be applied by these administrative agencies include fines, loss of license, or expulsion from the insurance program that was defrauded. The latter two penalties are especially severe because they basically mean that the healthcare provider can no longer operate. Most criminal justice experts agree that such criminal, civil, and administrative proceedings are cost effective in healthcare fraud cases. For every dollar spent on healthcare enforcement, \$8 is recovered by the government. In addition, the threat of liability is believed to keep many potential offenders from defrauding the healthcare system.

### CONSEQUENCES OF FRAUD

Most often, individuals think of the economic consequences of healthcare fraud, and these losses can

be quite high. Billions of dollars are lost each year to fraud in the healthcare field, far more than is lost to virtually all street crimes. It is important to note, however, that the consequences of healthcare fraud extend beyond these economic consequences. In particular, other consequences include: 1) a loss of trust in healthcare officials, 2) inadequate healthcare, 3) deprivations of healthcare, and 4) physical harm from unnecessary services.

The loss of trust is sure to result from most white-collar offenses, but it is more marked in healthcare fraud cases. Most people never expect healthcare providers to do anything wrong. When they do violate the law, the trust that members of society have in the healthcare field diminishes.

Inadequate healthcare and deprivation of healthcare are additional consequences of fraud in the healthcare system. There is only so much money available for healthcare in our society. If individuals are using the funds inappropriately, then others will not have the funds that are needed to obtain adequate healthcare, if they get any healthcare at all.

Physical harm can also result from unnecessary services. Cases of doctors leaving patients paralyzed, physically impaired, or even dead, as a result of unnecessary surgery occur at an alarming rate. Or, individuals may undergo severe stress worrying about tests their general practitioner told them they needed. The stress is unneeded, and the irony is that the stress can lead to health problems, which probably did not exist to begin with.

### FUTURE OF HEALTHCARE FRAUD

There are no expectations that healthcare fraud will magically disappear in the future. Types of fraud have been shifting to include internet-based healthcare fraud, cosmetic surgery fraud, and home healthcare fraud. Internet-based frauds are especially increasing. According to Tom Delaney, chief of the FBI’s healthcare fraud unit, physicians are “trying to find ways to bill for electronic patient visits.” Another FBI agent claims that “staged auto accidents are also making a comeback.”

Another trend in healthcare fraud is the growth of compliance programs in businesses and companies wanting to prevent accusations of fraud or abuse. According to Bonnie Schreiber and other researchers, compliance programs develop in healthcare businesses for one of three reasons. First, some

executives may simply think it is the right thing to do and encourage their company to develop a compliance program. Second, some healthcare companies may develop a compliance program as a result of being convicted of an offense. Third, some healthcare companies may develop a compliance program in order to be able to bill particular insurance companies. Among other things, compliance programs entail increasing awareness about healthcare billing rules and regulations.

In order to continue to control fraud, Charles Grayson (1998) argues that several policies must be implemented. First, he suggests that it must be made clear which agency is responsible for fraud control in a particular area. Second, he suggests that authorities should adopt a problem-solving approach (that is, define the problem, assess solutions, implement strategies, and assess response) to control fraud. Third, he calls upon investigators to watch for early signs of fraud before offenders are able to bilk the system out of millions. Fourth, he suggests that every claim submitted should face a likelihood of being reviewed by authorities. Finally, he argues that resources should be reallocated so that healthcare fraud investigators and prosecutors have enough funds to lead the attack in the war on healthcare fraud.

It is important to point out that although a great deal of monies are lost to fraud in the healthcare system, most healthcare providers are honest workers who never even think about committing criminal acts. Instead, it is believed that a handful of professionals commit the vast majority of crimes against the healthcare system. That handful of offenders, however, is able to cause a lot of damage.

## hoarding

HOARDING IS THE act of acquiring a large amount of a commodity in an attempt to increase the market price of the commodity to well above the price obtainable if there were many buyers and sellers in the market for the commodity. This type of market manipulation has also been attempted for several types of financial assets. Examples of goods that may have been manipulated in this manner include silver, oil, treasury bonds, and diamonds.

#### THE HUNT BROTHERS

In 1973, the Hunt family of Texas, possibly the richest family in America at the time, decided to buy precious metals as a hedge against inflation. At the time, private citizens could not legally own gold, so the Hunts began to buy an enormous quantity of silver. In 1979, the sons of patriarch H.L. Hunt, Nelson Bunker and William Herbert, together with some wealthy Arabs, formed a silver pool. In a short period of time they had amassed more than 200 million ounces of silver, equivalent to half the world's deliverable supply. When the Hunts had begun accumulating silver back in 1973 the price was in the \$1.95 per ounce range. Early in 1979, the price was about \$5. Late 1979 and early 1980, the

price was in the \$50s, peaking at \$54. Once the silver market was cornered, outsiders joined the chase but a combination of changed trading rules on the New York Metals Market (COMEX) and the intervention of the Federal Reserve put an end to the game. The price of silver began to slide, culminating in a 50 percent one-day decline on March 27, 1980, as the price plummeted from \$21.62 to \$10.80. The collapse of the silver market meant countless losses for speculators and the Hunt brothers declared bankruptcy in 1987. In August 1988, the Hunts were convicted of conspiring to manipulate the market.

### THE SALOMON SQUEEZE

Another example of an attempt to corner a market was the Salomon Squeeze. During the May 1991 two-year Treasury note auction, Salomon Brothers Inc., was in violation of the rules of the treasury auction procedure. They submitted some bids on behalf of customers without obtaining their authorization and, in the process, ended up controlling a major fraction of the May 1991 two-year note supply. During July and the first half of August 1991, government regulators launched a sweeping investigation of Salomon alleging the firm might have controlled 85 percent of the two-year Treasury notes that were auctioned on May 22, 1991. Treasury auction rules bar any one organization from buying more than 35 percent of a single issue at auction.

Treasury note prices commonly decline modestly right after auctions, when interest in the note sale fades. In a strategy designed to profit on the two-year note's trading pattern, many traders and arbitrageurs sell the two-year note short ahead of the auction. With most of the notes owned by Salomon Brothers after the May 1991 auction, the only way the short sellers could meet their delivery obligations was by buying the notes from Salomon Brothers at whatever price Salomon demanded.

### THE DIAMOND MONOPOLY

The discoveries of 1870–71 led to a great number of prospectors staking out diamond claims in South Africa, but Cecil Rhodes quickly brought about the merging of these interests into De Beers Consolidated Mines, Ltd. Established in 1889, De Beers, was an effective monopoly over the diamond indus-

try. The Illicit Diamond Buying Act, which limited the trade of diamonds to licensed buyers and imposed penalties for the possession of uncut stones without a license, further consolidated the monopoly position of the company. Most of the major diamond producers were forced to belong to or cooperate with the De Beers-led marketing cartel, which was formed to maintain the price of diamonds at a high level. De Beers, under Harry Oppenheimer's leadership (1957–84), maintained its dominant position in the industry by using its numerous worldwide companies to buy up new sources of diamonds and to control distribution of industrial diamonds and production of synthetic ones. Due to increased competition in the last decades of the 20th century De Beers' hold over the unpolished diamond market has decreased, and in 2000 the company announced it would end its policy of controlling diamond prices through hoarding and shift its focus to increasing sales.

### ROOSEVELT AND GOLD CONFISCATION

Governments have sometimes forbidden the hoarding of commodities by individuals. The most famous case of this type is President Franklin D. Roosevelt's confiscation of gold in the United States in 1933. Roosevelt believed that the gold standard was somewhat responsible for the banking crises of the 1930s (many economists believe the Federal Reserve's overprinting of money was the problem). With Executive Order 6102, Roosevelt made the ownership of more than \$100 worth of gold or gold certificates by any individual, partnership, association, or corporation illegal in the United States. All individuals and organizations were required to turn their gold over to the Federal Reserve System by May 1, 1933. Individuals who did not comply with this order were subject to a fine of up to \$10,000. Private ownership of gold in the United States for investment purposes was not relegalized until 1974.

### OIL COMPANIES AND PRICE CONTROLS

During the 1970s, U.S. oil companies were accused of hoarding oil in an attempt to inflate oil prices. While people were waiting in line for gasoline and many gas stations ran out of gas, there were reports in the news media about large numbers of fully loaded tankers standing offshore and full oil storage tanks around the country. These reports turned out

to be largely spurious; price controls, not hoarding were largely responsible for the oil shortage in the United States. Oil price controls were imposed in August 1971, which held down the supply of oil since many domestic sources and some foreign sources of oil could not be developed at a profit. After 1981, when price controls were repealed a major surge in domestic drilling and production occurred despite the fact that the U.S. government imposed an extremely high windfall-profits tax that deprived the oil companies of a major benefit of the repeal of price controls.

## Hobbs Act

THE HOBBS ACT IS a federal anti-racketeering law that makes it a crime to interfere with interstate commerce by extortion, robbery, or physical violence as in 18 U.S.C.A section 1951. Passed into law in 1946, the Hobbs Act was designed to battle organized crime, particularly to combat racketeering in labor-management disputes. The statute is frequently used in connection with cases involving public corruption, commercial disputes, and corruption directed at members of labor unions. Extant proof of racketeering as an element of a Hobbs Act offense is not required

The Act proscribes a number of separate offenses: 1) robbery, 2) extortion, 3) attempted robbery or extortion; and 4) conspiracy to commit robbery or extortion. Each such offense also requires

the federal jurisdictional element of obstruction, delay, or effect on interstate commerce. Primary investigative jurisdiction of Hobbs Act violations lies with the Federal Bureau of Investigation. The Inspector General's Office of Investigations, Division of Labor Racketeering, U.S. States Department of Labor, is also authorized to investigate violations of the act in labor-management disputes involving the extortion of property from employers.

The policy (9-131.040) regarding the robbery section of the Hobbs Act explicitly states that it is "only to be utilized in instances involving organized crime, gang activity, or wide-ranging schemes." The term extortion is defined as the "obtaining of property from another, with his consent, induced by wrongful use of actual or threatened force, violence, or fear, or under color of official right." Importantly, "fear" as defined in the act is not restricted to bodily injury. Rather, it includes fear of property damage and of economic loss resulting from failure to meet the extortive demand. Thus, situations involving labor relations where union representatives threaten to initiate labor trouble or continue labor unrest unless certain payments are made for the representatives' personal use are violations of the Hobbs Act. Similarly, payments made by employers because they fear financial loss if work stoppages or strikes begin or continue, are violations of the Hobbs Act.

The latter category in the definition of extortion, "under color of official right," generally concerns a public official trading her official actions in an area in which she has authority in exchange for the payment of money. For instance, such practices might involve municipal officials demanding money from contractors in return for official city approval of projects. The Supreme Court recently held that the "government need only show that a public official has obtained a payment to which he was not entitled, knowing that the payment was made in return for official acts."

A Hobbs Act application can involve a firm that is substantially involved in interstate commerce and meets extortion demands, thus depleting the firm's assets. Courts have ruled this depletion of assets is an obstruction, delay, or effect upon interstate commerce as contemplated by the prohibitions of the Hobbs Act.

For example, a stereotypical organized crime case involving the extortion of a local bar owner was deemed a violation of the Hobbs Act because

the extortion had the effect of diminishing the owner's ability to purchase for resale liquor originating in interstate commerce.

The U.S. Supreme Court, in March 2003, reversed a high-profile U.S. Circuit Court of Appeals ruling that upheld a nationwide injunction against anti-abortion organizations for engaging in acts of extortion in violation of the Hobbs Act by conspiring to shut down abortion clinics. The Supreme Court ruled that there were no acts of extortion under the Hobbs Act.

## Holley, Louis Malcolm (1949–)

ACCORDING TO a 2002 General Accounting Office (GAO) report, U.S. Postal Service deposits totaling \$65 billion per year are vulnerable to theft, robbery, and mishandling due to factors such as inadequate security and the failure to follow procedures. The official report was prompted by the circumstances of a large-scale postal facility theft in Arizona.

In June 2001, one Phoenix, Arizona, postal facility experienced \$3.2 million in such losses when it became the victim of the criminal acts of employee Louis Malcolm Holley. The GAO's examination of the Phoenix facility revealed several security problems, including a key to a cage with stored valuables that was left in the lock, as well as cameras that were not in use.

Holley, age 52 at the time, was a 28-year veteran of the postal service. On June 2, 2001, he promptly disappeared with his loot, which included coin, cash, checks, and money orders. Holley remained at

large for over two months, and was finally captured and arrested at a motel in a suburb of Seattle, Washington, on August 17, 2001. Approximately \$1.7 million in cash was recovered with Holley's arrest, with the remainder of the stolen deposits presumably destroyed. Holley was convicted of theft of public money, property, and records, and received a prison sentence of three years and five months.

What could have led up to such a massive theft? Several factors were identified in the investigation of this case. For instance, prior to 1997, local post offices regularly deposited their daily payments in the form of coin, cash, and checks with local banks. To save costs, the postal service began moving deposits by armed courier to central locations and then subsequently making deposits at commercial banks. The Phoenix facility where Holley's theft occurred was one such central location. The GAO report also revealed that the manager of the Phoenix facility had ignored security warnings from the Postal Inspection Service.

To prevent thefts like Holley's from occurring in the future, Congressional representatives requested tighter oversight of the postal service. In addition to losses of assets, failure to improve security may result in increased costs to the public, safety concerns for employees, and service disruptions.

## Home-Stake Swindle

THE HOME-STAKE Production Company was an oil-drilling tax shelter company based in Tulsa, Oklahoma. Its founder, Robert Trippet, was a well-educated Tulsa lawyer. Trippet's company began offer-

ing investments to the public in 1964. Home-Stake promised investors that their ventures were tax deductible. Investors were told to expect returns of at least three times the monetary value of their original investments. When Home-Stake did not deliver, lawsuits were filed against the company. Many of the plaintiffs were well-known Hollywood actors, actresses, and other television and entertainment industry personalities. The victims also included many top U.S. corporate executives.

An in-depth investigation by reporter David McClintick revealed that Home-Stake was a classic Ponzi scheme where money collected from late investors is used to pay off the early investors. The term comes from the late Charles A. Ponzi, an Italian immigrant and 1920s swindler who managed to fleece victims of more than \$15 million with his postal coupon scandal. McClintick referred to Home-Stake as “the biggest Ponzi scheme” due to the large number of would-be investors who fell for the swindle.

McClintick was originally tipped off to the scheme by a tax-lawyer friend. McClintick’s investigation suggested that, although Trippet appeared to be the mastermind behind the Home-Stake swindle, his close associates were also heavily involved. These included Kent Klineman, a New York tax lawyer who collaborated with Trippet to divert over \$3 million out of Home-Stake. Several other prominent lawyers and accountants were also part of the scheme, including David Melendy, Home-Stake’s financial vice president, who was well aware of the money mishandling problems.

McClintick also discovered that several U.S. law and accounting firms received payments from Home-Stake after advising several of their wealthy clients to invest in the company. Martin Bregman, a financial manager for many entertainment performers, provided the link to the vast number of celebrity investments in Home-Stake. Bregman received kickbacks after steering a multitude of clients toward Home-Stake.

After a thorough investigation, McClintick concluded that the numerous investors had been duped out of more than \$100 million. Although several of them did file lawsuits, Home-Stake convinced many of the earlier investors to cut their losses by donating their shares to charity. As a result of McClintick’s inquiries, as well as probing by officials, a Los Angeles federal grand jury investigated Home-Stake. In 1974, 45 counts of conspiracy, tax fraud,

securities fraud, and mail fraud were handed down against Trippet and 12 others.

## Hong Kong

A SMALL ISLAND and peninsula off the coast of China’s Guangdong province, Hong Kong was a British colony until 1997. The motivation for colonization was to open Chinese markets further to British trade and to facilitate the spread of opium within China. A number of large business organizations that were founded in Hong Kong or nearby regions had their origins in this trade, and Hong Kong remains a center for illegal international distribution of opium produced in Yunnan Province and mainland southeast Asia.

For almost all the second half of 20th century, Hong Kong acted as an outpost of capitalism uncomfortably close to communist mainland China. While politically inconvenient to the Chinese Communist Party, Hong Kong was nevertheless extremely useful to many influential Chinese who found that “round-tripping” their commercial ventures through nameplate enterprises in Hong Kong served to legitimize them. Much of the capital flowing into Hong Kong evaded official channels in one way or another.

The official trade figures of Hong Kong, which were themselves extremely large, served to hide the significant market for smuggling, which was active in all the markets in which mainland Chinese bought Western goods and those areas, such as rare animal parts for medicinal purposes, for which China could supply Hong Kong. There have been some suspicions more recently that Hong Kong banks, among others, have been the recipients of

funds illegally gathered by corrupt mainland officials. More generally, the process of underground banking, which has historically been of great importance to ethnic Chinese communities, is also believed to be widespread in Hong Kong.

The huge contrast between living conditions in Hong Kong and the mainland served to inspire many millions of Chinese to migrate to Hong Kong, often illegally, to seek their fortunes. Inevitably, the treatment they received as invisible workers varied considerably depending on the nature of their employers. Many more people were lured into the sex industry and domestic service, where they had poor access to the law in case of improper treatment. The sex industry was closely connected to organized crime groups and these were believed to maintain their freedom through bribery of officials.

The takeover of Hong Kong by the communist mainland suggests there is a danger of the suppression of the media and their ability to report crime. The danger of false reporting of information by politicized mainland sources was demonstrated during the SARS disease crisis of 2003 when accurate counts of victims were temporarily unavailable.

#### SNAKEHEAD GANGS

Hong Kong has also become a center for counterfeiting goods and for piracy of CDs and computer software, in common with many other cities in China and the region. It is also believed that some of the "snakehead" gangs that operate human-trafficking networks to move Chinese overseas are resident on the island. Certainly, some smaller aspects of the large shipping industry have been linked with piracy and fraud. Nevertheless, in common with Singapore, the Hong Kong business and legal systems have been based on British traditions and this has provided some safeguards with respect to white-collar crime. The extent to which the independence of Hong Kong's institutions will continue under mainland rule and, hence, the preservation of those systems in the current form, remains a contested issue.

## Hoover, Herbert (1874–1964)

IN HIS INAUGURAL address on March 4, 1929, President Herbert Hoover told the American people that his top priorities for the next four years were prosperity and freedom. Hoover said that he was particularly concerned about high levels of unemployment. He believed that the national government should take a greater role in promoting education and public health. Many historians believe that if Hoover had served the country at any other time than the coming of the Great Depression, he might have been considered one of the best presidents.

Although it has received little attention historically, Hoover's greatest achievement as president may have been his reform of the federal criminal justice system. Hoover had a personal as well as a presidential interest in the administration of justice and was particularly determined to prosecute anyone who engaged in securities fraud and violations of antitrust laws. During the 1928 presidential election, Hoover had promised to conduct a scientific study of crime and law enforcement.

After his election, Hoover followed through, appointing a crime study commission and declaring war on white-collar and organized crime. Hoover targeted notorious criminals such as Al Capone, believing that they could be stopped by repeated attacks on their economic resources.

Prohibition was in full swing during the Hoover years, and the president ordered his Attorney General William D. Mitchell to make sure that violators of the 18th Amendment were prosecuted to the fullest extent. Hoover also hired noted prison authority Sanford Bates to oversee a complete overhaul of the federal prison system, with orders to make it more effective. The president was also determined to make the Department of Justice (DOJ)

more effective and ethical, instructing Mitchell to rid DOJ of corrupt and inept federal prosecutors and launching extensive investigations of all judicial nominees.

In the 1930 election, the Democrats regained control of the House of Representatives with a gain of 50 seats and a one-vote margin in the Senate, which gave them control of all party leadership positions. Ironically, Hoover was more comfortable with Democratic leaders John Nance Garner and Joseph Robinson than he had been with Republican leaders. In reality, a large number of Progressive Republicans were incensed about what they called Hoover's "do-nothing" policies. In December 1931, Congress passed a number of bills that Hoover supported, including the establishment of the Reconstruction Finance Corporation (RFC) to make loans to banks, insurance companies, railroads, and farm mortgage associations. The Glass-Steagall Banking Act was passed to deal with runs on banks that had affected credit throughout the country. The Federal Home Loan Bank Act established regional banks that were charged with providing loans for mortgages and housing construction. Even when he managed to work with Congress to pass a bill, Hoover frequently limited the way in which the bill was implemented.

RED CENT

Under Hoover's direction, the RFC was secretly distributing millions of dollars a day in business loans. Congress complained that the president was willing to render relief to businesses, banks, loan associations, railroads, and foreign governments but was unwilling to give a "red cent to starving American women and children." Hoover also received a lot of criticism for the inequities in federal income taxes. While the working class was struggling to pay its share of taxes, millionaires like J.P. Morgan were sliding by without paying any taxes at all. It was only as the election of 1932 began to demand his attention that Hoover stopped vetoing appropriations for relief and signed a bill that allowed state governments to borrow from the RFC fund.

As the effects of the Depression worsened and Hoover seemed unable to provide the leadership the country wanted, the president was finally forced to accept the reality of his public image. Armed police were called out to protect him from mob violence as eggs and rocks were thrown at him. Some

members of mobs advocated hanging him. In the previous election, Hoover had carried 40 states. On November 8, 1932, he carried only six states. When the Great Depression overwhelmed the United States, Hoover was simply incapable of using innovative national government actions to deal with the crisis because he remained convinced that business and a free market in conjunction with state and local governments could see the country through economic mayhem.

HUD scandals

THE U.S. HOUSING Act of 1937, also known as the Wagner-Steagle Housing Act, created the Federal Housing Administration, later known as the Department of Housing and Urban Development (HUD). Throughout its history, HUD has been instrumental in providing affordable housing to low- and middle-income Americans.

On the down side, HUD has been involved in so many scandals that most people equate the agency with government corruption, ranging from simple mismanagement to criminal activities. Because the agency doles out billions of taxpayer dollars, the temptation to grab a portion of the profits has proved irresistible to scores of HUD employees over the years.

SECTION 608

HUD's first major scandal erupted over Section 608 rental housing, which allowed developers to make enormous profits at government expense. Section

608 of the National Housing Act of 1942, which had been created to provide rental housing for defense workers during World War II, was later extended to include housing for war veterans. The public's first inkling of the Section 608 scandal occurred on April 11, 1954, when the White House announced that the Commissioner of the Federal Housing Administration (FHA), Guy Hollyday, was resigning. The following day, President Dwight D. Eisenhower ordered federal agents to impound all FHA records dealing with the Section 608 program. The president acted in response to reports from the commissioner of the Internal Revenue Service (IRS) that a number of corporations which sponsored 608 rental housing were reporting large windfall profits from hundreds of projects negotiated by the FHA. The Federal Bureau of Investigation (FBI) had also notified the Eisenhower administration that a large number of American property owners had been victimized by dishonest dealers and salespersons who contracted for home improvement loans through HUD.

Investigators learned that throughout the history of Section 608, FHA employees at all levels had received gifts from developers seeking lucrative government contracts. At Christmas, developers had presented male field officers with liquor, fruit, cigars, turkeys, and neckties. Females had received nylons, scarves, candy, and fruit. Gifts for selected high-ranking FHA officials had included wristwatches, portable radios, and television sets. One developer in New Mexico hosted a ground-breaking celebration for an FHA official, then charged the construction project \$500 for the services of three "party girls."

Investigators learned that no effort had been made to avoid conflicts of interest, and many FHA employees held interests in companies that contracted with HUD. The Special Investigation Office of the Housing and Home Finance Agency (HHFA) that had been appointed by Eisenhower to investigate the FHA scandal identified at least 1,410 projects in which proceeds from mortgages were higher than reported costs, with a total in excess of \$110 million.

#### SECTIONS 235 AND 236

During the 1960s, as part of President Lyndon Johnson's War on Poverty, new emphasis was placed on providing housing for poor Americans.

FHA was assigned the responsibility of providing subsidized homeownership under Section 235 of the housing act and to support subsidized rental housing under Section 236. While concentrated attempts were made to curtail opportunities for scandal, a December 1970 staff report to the House Committee on Banking and Currency documented various scandals within the housing agency. In response, each field office director, chief underwriter, and chief appraiser was ordered to visit at least five inner-city projects. Results were reported at a meeting with HUD Secretary George Remney, leading to the suspension of the Section 235 home mortgage program until an investigation could be completed.

One of the worst examples of abuses uncovered by Remney's investigation concerned what became known as the Paterson Tavern Case. The house in question had been built around 1900 in Paterson, New Jersey, and was later turned into a tavern. In October 1969, the house was condemned; however, the owner later sold it for \$1,800. The new owner then paid \$450 for electrical repairs and sold the house through the HUD program in March 1970 for \$20,000. The bar used by the tavern still covered a large portion of the living room, paint was inexpertly applied over rough and broken walls, and the bedroom floor was warped and buckled, rendering the home inhabitable.

In 1971, the appraiser for the HUD office in Newark, and 11 other Newark employees, were indicted for fraud. Federal investigators discovered that one-third of Section 235 houses had been overappraised. Failure to comply with HUD requirements was found in hundreds of other cases. At least 84 houses contained major defects such as sagging floors, inoperable furnaces, rotting siding, and fallen plaster. Additionally, 119 cases of deferred maintenance were revealed, covering everything from leaky faucets to peeling paint. Another 86 cases involved failure to follow through with proper licensing and inspections for plumbing, wiring, and pest control projects.

#### THE ROBIN HOOD OF HUD

During the mid-1960s, Bruce Rozet established the Commonwealth United Corporation, a Hollywood conglomerate based in Beverly Hills, California. In January 1969, Rozet began working with the Fund of Funds, a European company, headed by Bernard Cornfeld, a European investor with a shady reputa-

tion, to raise \$30 million in Eurobonds with the intention of purchasing the Rexall Drugstore chain. When those plans fell through, Rozet decided that he could rob the rich and help the poor by negotiating contracts for subsidized housing, focusing on rehabilitation projects.

The result was a housing disaster that covered the United States from the Atlantic to the Pacific. When his questionable dealings became public knowledge, Rozet established HIPPLE (Housing Partnership Investments Limits) and continued to work with government housing projects. After California government officials refused to do business with any company led by Rozet, he paid himself a \$600,000 severance fee and began working in the background. In October 1977, the Securities and Exchange Commission (SEC) targeted Rozet and charged him with defrauding investors and falsely reporting profits.

Rozet again reinvented himself and established the National Development Services Corporation (NDS), which acquired existing HUD housing projects. By 1981, Rozet had been a party to the transfer of over 150 housing projects involving over \$400 million in real estate deals. Through a number of other under-the-table and behind-the-scenes deals, Rozet managed to make a \$200,000 profit for NDS over several years.

On February 13, 1989, President George H.W. Bush appointed former congressman Jack Kemp as head of HUD. When Kemp's attention was called to Tyler House, a Rozet project in Washington, D.C., he was outraged. The general contractor sent to investigate reported to Kemp that the house looked like "Beirut after the bombing." Other reports came in from all over the country reporting problems with Rozet's projects. Rozet was forbidden to do business with HUD. On April 27, 1998, Rozet was charged with overcharging HUD, inflating costs of repairs, and taking kickbacks on 90 separate projects in 25 states, Washington, D.C., and Puerto Rico.

#### HUD AND SAMUEL R. PIERCE, JR.

During his eight years in office under Ronald Reagan and Bush, most people thought that Samuel R. Pierce was doing an excellent job as secretary of HUD. At one point, Reagan called Pierce his "most effective Cabinet member." In reality, HUD was rife with corruption, and Pierce was asleep at his post,

sometimes spending whole days watching soap operas on his office television while his staff ran the agency. Congressional committees discovered that prominent Republicans were receiving millions of dollars in contracts from HUD officials who were pocketing tens of thousands in kickbacks. Republicans identified by investigators as influence peddlers included Bush's deputy chief of staff; a dancer and a former California senator; the former head of the General Services Administration; a personnel officer in the Reagan White House; a lobbyist and a Republican campaign adviser to Bush; and John Mitchell, former President Richard Nixon's attorney general. In addition to influence peddling, the 14-month Congressional investigation uncovered widespread fraud, abuse of office, blatant favoritism, monumental waste, and gross mismanagement at HUD.

The most colorful character in the Pierce scandal at HUD turned out to be a former barmaid turned executive secretary whose political lineage was traceable to high-ranking officials on both sides of the political spectrum. Deborah Gore Dean, a cousin to former Vice President Al Gore and stepdaughter to John Dean, a Nixon White House aide of Watergate fame, worked her way up to the position of assistant to Pierce. Dean rejoiced in negotiating deals and controlling access to the powers that be. During her reign at HUD, Dean virtually ran the agency, making sure that lucrative contracts were given to particular Republican consultants. While Pierce hid in his office, Dean used an autopen to sign his name to important documents, represented Pierce on various committees, lobbied Congress for increased appropriations to HUD, and served as HUD's link with the White House.

When she appeared before Congress, Dean invoked the 5th Amendment, protection from self-incrimination, and remained silent. In April 1992, Dean was indicted and charged with making false statements to Congress, fraud, and conspiracy. She denied any wrongdoing. In November 1993, Dean was convicted on 12 of 13 criminal counts stemming from her activities at HUD. Faced with the possibility of from seven to 57 years in jail, Dean was sentenced to only 21 months in prison. Numerous appeals kept her from serving her sentence, and her conviction was later overturned.

As head of the Urban Development Action Grant program (UDAG) at HUD, Lance Wilson rewarded himself with limousine and hotel service

and tickets to Broadway shows. Individuals seeking to do business with HUD wined and dined him and gave him clothes and pocket money. During investigations into the HUD scandal, investigators also learned that Wilson had neglected to report that he held an interest in a partnership that did business with HUD, or that he was paid consulting fees by various developers who worked with HUD. Wilson stated that he had made \$100,000 while employed by HUD. After leaving HUD, Wilson continued to negotiate deals with HUD. In 1992, he was indicted on 24 counts of fraud, conspiracy, and perjury.

Over a seven-year period, investigations by independent councils documented extensive influence peddling during Pierce's tenure at HUD. The investigation cost over \$27 million and netted 16 convictions. One lasting effect of the Pierce scandal was a change in the way that federal agencies report financial dealings. In 1990, after a bitter battle in Congress, the Chief Financial Officers Act became law, mandating the appointment of chief financial officers in 23 cabinet departments and federal agencies, each assigned the responsibility of monitoring accounting systems to prevent any form of corruption. The law also created the Office of Federal Financial Management to coordinate the work of the agencies and to provide overall financial oversight to the executive branch

#### HENRY G. CISNEROS

Another HUD scandal erupted when Henry G. Cisneros, President Bill Clinton's HUD secretary, was discovered to have lied to the Federal Bureau of Investigation (FBI) about how much money he had paid his mistress during a background check. Originally, Cisneros had told FBI agents that he paid Linda Jones, his mistress and a political fundraiser, around \$2,500 a month. Cisneros later admitted that between 1990 and 1994, he had paid Jones over \$250,000. As a result of the scandal, he was forced to resign from office.

On September 8, 1999, Cisneros pled guilty to the misdemeanor charge of lying to the FBI and agreed to pay a \$10,000 fine, ending an investigation that had lasted four years and which had cost the U.S. government over \$9 million. On the day the settlement was announced, Cisneros had been slated to stand trial on 18 felony charges in federal court. Clinton pardoned Cisneros before he left the presidency.

## human trafficking

HUMAN trafficking refers to the exploitation of people through transporting, recruiting, harboring, providing, or receiving people for a number of activities in which others benefit financially. It is a global problem and a social concern for many who are trying to thwart organized criminal activity. Human trafficking is logically considered a subset of organized crime, but it also has strong tangential relationships with white-collar crime: The same criminal elements in many parts of the world are engaged in political corruption, bribery, payoffs, and kickbacks, and drug and human trafficking.

Human trafficking involves both adults and children, males and females, and often has disastrous consequences for the victims of these activities on personal as well as governmental levels. It is an issue that is global in scope and that involves the abuse of the most basic tenets of human rights. Human trafficking vividly illustrates the results of poor economic conditions and the devaluation of oppressed people. It is estimated that approximately 900,000 people are trafficked each year globally

and 20,000 are trafficked into the borders of the United States.

Forced labor, more commonly known as slavery, has likely been around since shortly after the dawn of humankind. This abhorrent practice continues throughout the world despite attempts and varying strategies by governments to stop it. Many adults and children are lured into positions of forced labor in the hope of a better way of life. It is widely believed that slavery no longer exists in the modern world; however, this is a fallacy. Slavery has simply changed form over time.

Slavery continues to exist. Kevin Bales, a leading expert in the area of what is known as “modern slavery,” notes the differences between the old slavery of ancient Greece, Egypt, and Rome, and even the “peculiar” institution of 19th-century American slavery, and the new type of slavery that has developed globally since World War II.

The contemporary forms of slavery have resulted primarily from population increases and social change. A typology of this new slavery is also provided by Bales: 1) chattel slavery, a remnant of the old slavery, in which people are born, captured, or sold into slavery; 2) debt bondage, sometimes called peonage and the most common form of contemporary slavery, in which people are enslaved in order to pay off debts (sometimes continuing through several generations of family servitude); 3) contract slavery, in which false or deceptive contracts are used to justify or explain forced slavery; 4) war slavery, in which people are enslaved in order to defray costs associated with military campaigns; 5) domestic servitude, in which “extra children” (children from excessively large families) are placed into domestic service, often for extended periods of time, and 6) ritual (religion-based) slavery, in which people (usually young girls) are provided as slaves, often in sexual enslavement, to atone for the sins of family members. An understanding of the new forms of slavery is important in understanding the various aspects of trafficking in humans.

### CHILD EXPLOITATION

Children are often sold or sent to areas with the promise of a better life but instead encounter various forms of exploitation. Children are often forced to work in cottage industries, manufacturing operations, the entertainment industry, or other occupations. They are frequently required to work for

excessive periods of time, under extremely hazardous working conditions, and for little or no wages. Sometimes they become “street children” and come under the influence of youth gangs, and are used for prostitution, theft related offenses, begging, or become actively involved in the drug trade. In addition, children are sometimes recruited into military service and experience armed combat situations at very young ages.

### SEX CRIMES

A very common form of human trafficking that results in servitude is the recruitment and transport of people into the international sex industry. Sex slavery involves males and females, and both adults and children. It consists of a number of different types of forced servitude including forced prostitution, pornography, child sex rings, and sex-related occupations such as nude dancing and modeling. Forced prostitution is a very old form of enslavement and recruitment into this lifestyle is often a booming business for purveyors of the sex trade.

The practice was earlier called “white slavery” to differentiate the practice from the enslavement of Africans in the United States and other countries, and received much attention around the turn of the 20th century. Victims of sexual slavery are often manipulated into believing that they are being relocated to areas in which they will benefit financially and work under favorable occupational conditions, normally not being told that they are going into sex-related occupations. They are promised legitimate forms of employment as domestic laborers, farm workers, nannies, food servers, retail sales clerks, or other licit types of occupations. Those who enter the sex industry as prostitutes are exposed to inhumane and potentially fatal conditions, especially with the advent of AIDS.

### SELLING ORGANS

Another recent and highly controversial occurrence involving human trafficking is the abduction or deception that results in the involuntary removal of bodily organs. For years there have been reports from Asia that human organs were harvested from executed prisoners without the consent of family members and transported to transplant recipients in various countries. There have also been reported incidents of the removal and transport of organs by

medical and hospital employees. In addition, there have been claims of impoverished people selling organs such as kidneys for cash or collateral. Although there have been some allegations of trafficking of human fetuses for use in the cosmetics and drug industry, these reports have not been substantiated. In recent years, the internet has been used as a medium for the donors and recipients of organ trafficking, whether legal or not.

## CAUSES

There are many possible causes of human trafficking and most involve the economic situations of the areas in which the trafficked people live. Bales describes three primary factors that reflect the new style of slavery that has developed over several decades: 1) as mentioned earlier, a dramatic increase in the world population has produced an overabundance of people for the job market; the residual people are normally those that lack power and are highly vulnerable to the abuses of slaveholders; 2) the modernization of agricultural equipment and practices has aggravated conditions for poor farm workers, adding to the vulnerability of these individuals; and 3) the changing economic and social conditions have created opportunities for exploitation not only by greedy slaveholders but also corrupt officials; anomic conditions reflect the breakdown of cultural bonds that are no longer able to protect those vulnerable to contemporary slavery.

The U.S. Department of State adds that the HIV/AIDS epidemic is creating a large number of orphans and child-headed households, a situation that creates fertile soil for trafficking and servitude. The agency also provides insight into some potentially disastrous effects to the world, including: 1) a deprivation of a normal life and basic human dignity; 2) a breakdown in normative structures and the resulting increase in other forms of criminal activity; 3) a negative impact on the labor markets and social conditions; 4) an increased exposure of people to abuse and HIV/AIDS; 5) an undermining of local governmental agencies; and 6) an increase in organized criminal activities and activities involving corruption among law enforcement officials.

Many governmental entities throughout the world and in individual nations attempt to stop or at least slow the activity of trafficking in humans. In 2000, the United Nations established the Protocol to Prevent, Suppress and Punish Trafficking in Per-

sons, Especially Women and Children, Supplementing the United Nations Convention Against Transnational Organized Crime, which provided a commonly accepted working definition of human trafficking, and which called upon national governments to promulgate laws to combat the practice, to provide assistance for victims, and to promote coordination and cooperation between countries.

The Office of Drugs and Crime is the arm of the United Nations that has the responsibility of monitoring and implementing policies concerning human trafficking and is the designer of the Global Program Against Trafficking in Human Beings (GPAT). Another important international agency with responsibility in this area is Interpol, the international policing agency, whose aims are to provide assistance to all national criminal justice agencies, raise awareness of the issue, and promote competence among agencies.

Other involved global organizations include the International Labor Organization (ILO) and the International Organization for Migration (IOM), as well as a host of other governmental and non-governmental entities. In the United States, many federal agencies are given the oversight of human trafficking, including the Department of Justice, Department of Homeland Security, Department of Health and Human Services, Department of Labor, and the U.S. Agency for International Development. The primary U.S. agency charged with monitoring human trafficking is the State Department's Office to Monitor and Combat Trafficking in Persons (also called the trafficking office).

The incidence of trafficking in persons and the accompanying forced servitude, often called the new slavery, is gaining increasing notice from the world community. In 2000, the United Nations put the subject in the international spotlight and called for changes in state policy for what the International Labor Organization has termed "the underside of globalization."

## Hyde, Edward (1661–1723)

EDWARD HYDE (Lord Cornbury), a cousin to Queen Anne of England, was widely considered to be the black sheep of the royal family. Nevertheless, his prominent connections enabled him to be appointed governor of the New York colony, and he held that position from 1702 to 1708. Governor Hyde quickly confirmed his scurrilous reputation. Indeed, he probably did more than any other royal governor to bring British administration in America into disrepute.

In the simplest of terms, Hyde was a drunkard and an unabashed transvestite, with a penchant for addressing the New York Assembly while wearing

his wife's clothes. He was also a crook, as thoroughly dishonest in his public role as he was outlandish in his private life. He illegally allotted huge land grants, ranging in size from 50,000 to 1 million acres or more in exchange for kickbacks and bribes.

In 1707, Hyde claimed to have received secret information that the French were preparing to invade New York by sea. He taxed the citizenry 1,500 pounds, ostensibly for the construction of protective batteries around the harbor. The French invasion was a fabrication; Hyde used the funds to build a lavish new mansion for himself on a tract of land he immodestly renamed Hyde Park. Ironically, the property would later house become the family estate of the Roosevelts. Governor Hyde's thievery so outraged the Assembly that he was removed from office and briefly imprisoned.

Some historians and other social scientists consider this the first major political corruption scandal in American history.

## IBM

ONCE FAMOUS FOR ITS one-word motto, “Think,” this high-technology colossus pursued ideas that included secret files and collaboration with foreign governments. In 1996, IBM was rumored to have sold two shipments of high performance computers to Russian nuclear research facilities, one in the closed city of Arzamas-16 and the other in an unknown location. A Congressional investigation noted that the United States would benefit from assuring Russia’s cooperation with the Comprehensive Test Ban Treaty (CTBT) by allowing it to maintain its existing nuclear stockpile through computer simulations. The problem with IBM’s activities was that the company had applied for the necessary federal license to ship the computers; when the government requested more information on how the computers would be used, IBM short-circuited the process by shipping the computers through its German subsidiary to a Moscow computer dealer, Jet Infosystems.

Russian diplomats argued that the United States had promised similar computers as an incentive to agree to the CTBT. Private industry pursued the business. “IBM was very pushy. They thought Arzamas could be like Los Alamos, a very prestigious customer,” Yevgeny Shablygin, head of Jet Infosystems, told the *New York Times*. Russia refused

to cooperate in the federal prosecution of IBM. The case was settled in 1998, with IBM paying an \$8.5 million fine. The U.S. Department of Energy quietly contributed \$2.3 million to a project with the Russian Ministry of Atomic Energy, resulting in the 16 illicit computers being featured in an “open computer center” dedicated to nonweapons research, in Arzamas-16, now returned to its former name of Sarov. The center opened in September 1999.

Using European subsidiaries to evade U.S. laws was not new to IBM. In a controversial 2001 book, Holocaust expert Edwin Black argued that the keystone of IBM’s business strategy in 1930s Europe was supplying equipment and expertise to the Nazi program of identifying and exterminating Jews. Identifying Jews for deportation to concentration camps required a massive census effort. IBM not only actively pursued the business of providing customized Hollerith machines and punch cards—an early form of computer technology—but also provided technical support to Nazi governments throughout World War II.

When numerous U.S.-based companies were blacklisted for trading with the enemy in 1942, IBM’s subsidiaries were not included. However, a separate 1943 investigation established that IBM’s New York headquarters had approved the company’s activities in Germany as part of an effort to establish a cartel controlling the world’s supply of

computer punch cards. Black notes that, since the U.S. government saw the Hollerith machines in Europe as critical to the success of its military occupation, IBM was never penalized. The company reabsorbed its German subsidiary and its profits; other European subsidiaries had always reported directly to American headquarters. A 2001 class action suit by Holocaust survivors against IBM was swiftly dropped due to concerns that it would slow long-awaited German plans for restitution to survivors.

Charges of monopolistic practices resurfaced in the late 1960s, when IBM was barraged with lawsuits from computer industry competitors. The company's practice of bundling equipment, peripherals, programs, and support under a single price was seen by smaller manufacturers as a tactic to keep rivals out of each separate market. While most suits did little damage to IBM, peripherals manufacturer Telex scored a temporary victory in 1973, when a judge ruled that IBM's SMASH initiative to gain market share through lowered prices was an antitrust violation worth \$350 million in damages. Historian Robert Sobel argues that before the verdict was reversed on appeal, suing IBM became a key business strategy for smaller competitors simply as a means of demonstrating commitment to growth.

#### ANTITRUST CHARGES

The U.S. Department of Justice also pursued antitrust charges against IBM starting in 1969, but the case stalled on the absence of a vast computerized document index, developed for a 1968 antitrust action initiated by Control Data Corporation (CDC), that was rumored to prove IBM's monopolistic practices beyond doubt. However, IBM's settlement with CDC required CDC to destroy the index in the presence of IBM's attorneys. This was done despite Justice Department efforts to prevent it. The federal charges were dropped in 1982.

Secret databases would also become critical to a lawsuit filed by former IBM workers, who allege that the company knew, from its 30-year file of employee death records, that employees faced excess cancer risks due to exposure to toxic chemicals. As of September 2003, IBM was seeking to exclude analysis of the files from upcoming hearings in Santa Clara, California, arguing that the information was incomplete.

## identity theft

**IDENTITY THEFT** or fraud is the wrongful obtainment and use of someone else's personal data in some way that involves fraud or deception, typically for economic gain. Many people become victims of identity theft each year, although there are no accurate statistics that can put an exact dollar amount on the cost that Americans suffer financially and emotionally each year. Monetary loss is just one side of identity theft. Victims suffer long-term physical and emotional strain as they seek to restore normalcy to their lives and their credit. According to a report issued in March 2002 by the U.S. General Accounting Office, identity theft is one of the fastest-growing crimes in the United States and the world today. Recent statistics show that approximately 700,000 individuals are victimized each year.

Unfortunately, identity theft can happen in many ways and with relative ease. Dumpster diving, mail theft, inside sources, impersonation, online data, direct access, and stolen purses and wallets are the most common ways an identity is stolen.

Dumpster diving consists of thieves rummaging through trashcans searching for personal identification (receipts, bank statements) that can be used to steal an identity. A crosscut shredder may be the best investment any individual can make to prevent this form of identity theft.

Fraudsters steal mail from mailboxes that have been conveniently flagged as holding mail. At the end and beginning of each month, thousands of people pay their bills, place them in their mailboxes, and put the red flag up to alert postal workers that mail is ready for pickup. Unfortunately, this red flag also tells the would-be criminal that mail is ready for stealing. Credit card bills contain encoded credit card and personal identification on the bill, and banking information is located on the check set for payment.

A dishonest employee with access to personal records, payroll information, insurance files, and account numbers and sales records can wreak havoc on others' credit and facilitate identity theft. In New York City in 2002, three individuals were indicted for allegedly stealing the identities of more than 30,000 people, stealing at least \$2.7 million. This scheme was spearheaded by a junior employee of a company that worked for the major credit reporting agencies and had access to credit histories. The circumstances that enabled this incident to occur could easily be repeated if credit data is not safeguarded.

Internet or online data has become common. Thieves can access data that consumers share through phone listings, directories, memberships, etc. Thieves can also purchase sensitive personal information from an online broker. Social security numbers, birthdates, and other personal information should never be shared over the internet unless one knows for certain that the site is legitimate and protected with encryption software.

Stolen purses and wallets are easy ways to assume someone's identity. Bank cards and personal information can also be stolen directly from one's house by people such as babysitters, friends, roommates, and cleaning personnel.

There is no foolproof way to prevent crime, but experts advise consumers can decrease the chances of becoming an identity theft victim. Guard personal information, never give out Social Security numbers to anyone unless there is a good reason for needing it. Destroy sensitive papers, like receipts, credit card applications. Invest in a paper shredder,

*A lost wallet in the wrong hands can mean years of efforts to recover from identity theft and to clean a credit record.*

be suspicious of telephone solicitors, use a locked mailbox, and check credit reports once a year from the three major credit reporting agencies.

Identity theft is a crime that hurts its victims not just once but twice. First, since most people do not check their credit reports on a regular basis, they discover that they are a victim by getting turned down for a loan for a car or house. Second, once a person does figure out that her identity has been stolen, she needs to go through a remarkably arduous process to repair the credit. In many instances, it takes years for the credit agencies to investigate the fraudulent activity; in the meantime, the car loan or mortgage will be delayed or denied.

The new 21st century and its database technologies of consumer profiles offer fresh opportunities for fraudsters. One of the biggest problems with cases of identity theft is that it can take months, or even years, before the victim is aware of any wrongdoing.

## illegal competition

ILLEGAL COMPETITION refers to particular business practices or strategies banned by legal statutes. Ideally, legislation bans types of competition that either inhibit economic efficiency or are inherently unethical. There is a strong association between competition and economic efficiency. In contrast, monopolistic prices reduce economic efficiency by reducing the total amount traded in monopolized markets. These unrealized gains from trade represent a misallocation of scarce resources. Also, there is a transfer of income for those who buy monopolized goods at higher prices. The monopolist gains rent, the difference between the monopoly and competitive prices multiplied by the number of remaining sales. Consumers lose this income. The costs of affecting these transfers represent additional waste.

Consumers generally benefit from competition between businesses because it leads to lower prices and higher quality. To expand, or even retain, market share in a competitive environment, businesses must offer the highest quality and lowest prices that they can manage. There are, however, some business strategies that some argue reduce overall economic efficiency. Predatory pricing is a strategy whereby a business sells its product below cost. The immediate effects of this pricing strategy are beneficial to consumers. However, the long run affect of predatory pricing is to drive out rival firms. Leaving the predatory firm with a monopoly. As a monopolist it would then want to raise its prices above competitive levels.

### STANDARD OIL

Perhaps the single most important case concerning predatory pricing was *Standard Oil Company of New Jersey v. United States*. In the late 19th century, Standard Oil attained 90 percent market share in American oil refining. The Supreme Court found Standard Oil in violation of the Sherman Antitrust Act, specifying predatory practices on the part of Standard Oil. Critics of this and other similar rulings have argued that the evidence actually reveals the rarity and ineffectiveness of predatory pricing.

Often, the refineries that Standard shut down with a price war simply reopened after Standard increased its prices. In the absence of barriers to entry

in the market in question, it is not clear that a predatory pricing strategy will work. This strategy requires large financial resources on the part of the predatory firm, along with the willingness to risk them in such predatory ventures. Doubts concerning the profitability of this strategy have left many economists skeptical concerning the need for legal rules against predation.

There were other allegations against Standard. Some claimed that Standard committed industrial espionage and sabotage. While nobody proved the worst accusations against Standard, some businesses do commit serious crimes in attempts to gain market share. Such practices clearly involve illegal acts. Businesses attempt to steal information on their rival's research and development. Increased market share through such practices provide no benefits to consumers.

### DUMPING AND TYING

Corporate dumping is a variation on the predatory theme. Dumping usually refers to foreign competitors who sell their products below production costs in order to subdue domestic producers. Foreign firms may sell at lower prices abroad than at home. Profits in their domestic markets go to subsidize short-run losses abroad. After gaining monopolies abroad, these foreign firms can begin reaping monopoly profits.

One example of alleged dumping concerns the export of apple juice from China to the United States. U.S. firms claimed that they lost \$135 million due to Chinese dumping juice in American markets at prices below production costs. Another example is provided by Smith Corona when it accused Brother Industries of Japan of dumping portable typewriters. Also, U.S. steel industry representatives claim that Russia, Japan, and Brazil have dumped quality steel products.

While there are obvious jurisdictional limits to U.S. antitrust laws, public officials can deal with such practices by imposing anti-dumping duties on foreign firms that sell at less than fair market value. The imposition of these duties on companies that supposedly engage in dumping sets limits, in theory, on the ability of exporting businesses to compete in this manner. In practice, the existence of legitimate cases of successful dumping is questionable, and efforts to limit cheap imports have often met with little success.

Tying is a practice whereby a business requires its customers to buy two products together. If a business has a monopoly on the supply of one product, it can extend its monopoly leverage to other products through tying. Section One of the Sherman Act and Section Three of the Clayton Act prohibit this practice when it “restrains trade substantially” and “may tend to create a monopoly.”

The Justice Department case against Microsoft concerned tying and the laws against it. Microsoft required computer manufacturers to use their internet browser along with their Windows operating system. Microsoft supplied their browser at no additional cost. Yet, Judge Thomas Jackson ordered Microsoft to provide its operating system and browser separately.

#### FRAUD

False advertising and fraud are also forms of illegal competition. Businesses that gain market share by misrepresenting their own or their competitors' products are subject to legal penalties. One famous case of alleged fraud was filed against Preston Tucker and his Tucker Corporation in the late 1940s. Prosecutors in this case needed to prove that the car Tucker claimed to be developing either could not be built or would not live up to expectations. Tucker and his associates were cleared of these charges in 1950. While not every case of fraud stands on its merits, legitimate cases do exist and require judicial action. False advertising and fraud obviously run counter to the notion of moving resources to their most highly valued uses. The notion that fraud reduces economic efficiency is therefore hardly controversial.

While the examples of espionage, fraud, and sabotage are clearly undesirable, Antitrust laws concerning pricing strategies are more controversial. There are reasons to believe that antitrust laws are unnecessary, or perhaps even counterproductive. This viewpoint says businesses faced with declining market share might lobby the government for antitrust cases against their more successful competitors. Businesses that gain market share for legitimate reasons may then face unwarranted legal action. These costs are not inconsequential.

The lawsuits enacted by the Justice Department and by private businesses often involve cases where businesses have expanded output and lowered prices. Also, statistical studies indicate that abnormally high rates of profit are either transitory or

due to superior efficiency. At least part of the reason for antitrust laws is to enable businesses that are less able to serve their customers to persist. Resource expenditures on lawsuits for this purpose lead to transfers to such firms. This “rent seeking” behavior reduces economic efficiency and can, in the extreme, lower living standards.

Some forms of competition reduce economic efficiency and breach ethical barriers. Other forms of competition are either harmless or beneficial, and may be wrongly prohibited. It is undeniable that the profit motive drives private businesses, rather than the general welfare of society or ethical considerations. This makes the definition and enforcement of laws that target harmful competition both necessary and problematic. It is necessary to restrain the pursuit of profits where it leads to the monopolistic misallocation of resources, but equally necessary to insure that business laws do not facilitate such misallocation instead.

## Imperial Food Products

ON SEPTEMBER 3, 1991, 25 workers at the Imperial Food Products chicken processing plant in Hamlet, North Carolina were killed in an explosion and fire. A rupture of a hydraulic line near a deep

fryer caused the explosion. However, through the investigation of the explosion, it was determined that the employees died because the fire doors were locked and they were unable to escape. All but one of the deaths were caused by smoke inhalation, which would have been prevented if the employees were able to escape. Many of the employees escaped the smoke by retreating to a large freezer, but they were unable to fully close it to keep out the toxic smoke and subsequently died. The employees had time to reach the freezer, so they most likely would have had time to escape if the fire doors had not been locked and there were adequate and well-known ways to safety. This evidence led to criminal charges levied against the plant owner and manager.

This unfortunate disaster has been labeled as a state and corporate crime because of the failure of not only the plant owner and manager but because of a long history of failure to inspect the plant by various state and federal agencies. The Occupational Health and Safety Administration (OSHA) is the main federal regulatory agency charged with the health and safety of workplaces for employees in the United States. OSHA was created in 1970 from the Occupational Safety Health Act. The act's stated goal is to ensure that every working person and woman in the United States has safe and healthful working conditions. The law has given employees a wide range of rights. One of these rights requires companies to reduce risks in the workplace, and if there are risks, then employees have the right to fight for health and safety.

During the 1980s, OSHA's budget was drastically cut and this had a major impact on the ability for OSHA agents to conduct inspections. Inspections are the main tool used to make sure that companies comply with safety standards that are set for each industry. In 2003, OSHA had 1,123 inspectors charged with overseeing approximately 7 million worksites that employ over 111 million workers. OSHA had 1,388 inspectors in 1980. The United States has seen an increase in worksites and employees but a decrease in the number of inspectors. Because OSHA is so strapped for inspectors, it allows many of the states to take over this responsibility. Section 18 of the Occupational Safety and Health Act of 1970 encourages states to develop and operate their own job safety and health programs. OSHA approves and monitors state plans.

North Carolina, where Imperial Food Products was located, is one of the 23 states that have a state-

run OSHA program. Many of these 23 states have only conditional approval though, because they may not comply with federal OSHA regulations. At the time of the Imperial explosion, North Carolina was not in compliance and they were on probation.

Each state that has its own OSHA operation is permitted to set its own penalties and priorities. North Carolina has historically minimized the effect of penalties for health and safety violations. For example, many of the maximum fines in North Carolina are a fraction of the federal fine maximums. The plant had never had a single safety inspection during its 11 years of operation, which shows the complete failure of the North Carolina OSHA inspectors.

All work sites must post the phone number of OSHA or the state equivalent so that employees know who to contact to report safety violations. At the Imperial Food Products plant, the poster listed a number that was disconnected with no forwarding one. This simple and basic requirement was not even being met, let alone the dozen other safety violations that were occurring at the plant, including the lack of fire alarms and sprinkler system, in addition to the blocked and locked doors. By law, in the case of fire codes, exits are to be clearly marked and known to the employees. Federal OSHA law is even stronger in language it that it states that every exit must be well lit, door passages and stairways need to be clearly marked and all doors must be unobstructed.

In September 1992, the owner of Imperial Food Products, Emmett Roe, age 65, pleaded guilty to involuntary manslaughter as part of a plea bargain. His son Brad was let off scot-free as part of the plea bargain. Emmett was sentenced to 20 years in prison for his responsibility in the deaths of 25 of his workers. The case remains one of the severest punishments for a worker-safety violation.

## impersonation

Assuming the identity of another person, real or unreal, deceased or living, or pretending to possess characteristics that do not accurately reflect one's true attributes or background are characteristics of impersonation. The individuals who practice this activity are commonly known as impersonators; however, if the impersonation involves fraud and deception, other more negative terms are used, such as impostors, charlatans, or mountebanks. Criminal forms of impersonation are often referred to as false personation and offenders are subject to varying forms and degrees of sanction.

Throughout history, there have been numerous cases of people who use have used false personation in a variety of different ways and many have become quite famous for their activities. Many of these identity thieves have been the inspiration for books, articles, television specials, documentaries, plays, and movies and have achieved a significant degree of notoriety during the periods of time in which they lived (and still live).

George Psalmanazar was one of the early imposters to become famous as a result of false affirmation. In the very early 1700s, Psalmanazar claimed to be a native of Formosa (modern day Taiwan) and became somewhat of a curiosity in Europe as he passed himself as an expert in Formosan culture. His book, *An Historical and Geographical Description of Formosa*, was published in 1704 and Psalmanazar was given an academic appointment at Oxford College as a linguistic translator and lecturer in Formosan civilization.

However, people began to wonder why this person of reportedly Asian descent was blond and light-skinned. Jesuit missionaries who had been to Formosa were especially vocal in refuting his claims. The impostor continued the hoax until 1706, when he admitted to misleading the public. Although little is known of his actual identity, it is believed that Psalmanazar (which was not his original name) was

a French wanderer. He continued to write and publish until his death. The memoirs of his imposture were published posthumously.

## ANASTASIA

Another famous case of impersonation was Anna Anderson, who claimed to be Grand Duchess Anastasia Nicholaevna, daughter of Tsar Nicholas II of Russia. In 1918, the imperial family was murdered and their bodies were buried in hidden graves. Two years later, a woman going by the name Anna Anderson came to public attention after attempting to jump from a bridge in Germany. She was placed in a mental institution and later claimed to be the grand duchess

There were many similarities between the two, and Anderson seemed to have an unusual level of knowledge about the imperial family. Anderson filed suit in Germany to prove her claims and to accept her rightful inheritance. The legal proceedings lasted from 1938 to 1970 and though some experts claimed that she was, in fact, the Tsar's daughter, the court did not find in her favor.

After marrying a wealthy American and moving to the United States, Anderson died in 1984, never having received support for her claims. DNA analysis conducted years later confirmed that Anderson was not Anastasia. Despite scientific evidence to the contrary, many people still believe that she was truly the duchess. The story has generated books, articles, television documentaries, three movies, and continuing controversy over Anna's actual identity.

Some cases of impersonation involved "passing" as a person of another racial or ethnic group, or of the other gender. In particular, it seems that impersonating Native Americans was a popular endeavor for several people. Although there have been many "faux Indians," three gained the most fame in their respective time periods. Chief Buffalo Child Long Lance, despite many inconsistencies in his claims, passed as one of the most famous American Indians in American and Canada until his death by suicide in 1932; he achieved fame and wealth (including movie roles) despite the fact that he was actually an African-American from North Carolina.

Even more famous than Chief Buffalo Child Long Lance was Grey Owl, a Canadian conservationist and outdoor guide, who assimilated with the Ojibwa and, in the early part of the 20th century, became a famous author and the subject of the

movie *Grey Owl*, released in 1999; this imposter was actually from England.

Iron Eyes Cody was at one time America's most recognizable American Indian movie actor and activist, best known as the "crying Indian" portrayed in the Keep American Beautiful campaign television commercials in the early 1970s; it was later determined that Iron Eyes was actually an Italian-American from Louisiana, though he vehemently denied the claim. Although each of these individuals used deception in passing themselves as American Indians, it should be noted that they all made contributions to the plight of their adopted group.

#### FANTASTIC IMPERSONATORS

There are numerous examples of literary authors who write under assumed names, but some have seemed to actually accept new identities. Patrick O'Brian is a notable example of this situation. O'Brian was the author of several literary classes of sea-related adventures, including the novel *Master and Commander*, which was released as a movie in 2003. O'Brian claimed to be Irish Catholic and educated by a governess, however it was later found that he was actually Richard Patrick Russ, who was born and reared in Britain by Jewish parents, and educated in a less than prestigious boarding school.

Perhaps the most famous imposters in the music world are the two members of the pop band Milli Vanilli. This band, consisting of European singers Fab Morvan and Rob Pilatus, released an album that earned a Grammy for Best New Artists in 1989. It was later learned that other artists actually sang the songs on the CD and the two imposters lip-synched the words when performing. The faux band's producer admitted the hoax and Milli Vanilli was forced to relinquish their Grammy. Subsequent attempts to release "real" albums failed and Pilatus later died of a drug overdose.

Some impersonators became so famous that they had movies based on their deceptive exploits. David Hampton found that claiming to be the son of famous actor and singer Sidney Poitier allowed him to swindle several high profile people out of their money; Hampton became the inspiration for the play, and later movie, *Six Degrees of Separation*. Another well-known deceiver was Ferdinand Waldo Demara, Jr., who passed as a number of assumed identities such as physician, zoologist, law

student, researcher, orderly, deputy, and teacher, apparently simply for the pleasure of getting away with it; the popular book and movie *The Great Imposter* was based on his life. The most famous identity con man, however, is probably Frank Abagnale, Jr., who posed so successfully as an airline pilot, attorney, professor, and physician that, after serving years in prison for his deceptive activities, he became an investigator of fraud; he was the subject of the book and movie *Catch Me if You Can*.

The individuals listed above exemplify the most famous cases of identity deception. The motives of these people are different: some wanted wealth, others wanted fame, and others seemed to get enjoyment from the activity itself. Perhaps all of the offenders wanted elements of all three, to varying degrees. The issue of "passing" as someone else is intriguing from a social psychological perspective. According to some authors, imposters are simply part of the national zeitgeist and the reason that society disapproves of these "identity chameleons" is that they disrupt expectations of safety and our collective notion of reality. It was the zeitgeist, or "spirit of the times" that is sometimes used to explain the reactions of one of the greatest hoaxes in American history; on Halloween in 1938, Orson Welles, posing as an imminent scientist, described the landing of Martian space ships as part of a radio broadcast which set off an episode of mass hysteria throughout the nation. Perhaps the new zeitgeist is one of a more technical nature and there growing concern over the issue of identity theft. Identity thieves obtain personal information from victims then use this information for personal, normally financial, gain. Following the patterns of history, it is likely to assume that new imposters will become famous over their exploits and will be the subject of books, television specials, and movies. In this manner, they will be simply impersonating the "identity thieves" who came before them.

## Indonesia

THE UNITED STATES provided arms aid to the Republic of Indonesia in a 1958 military coup that overthrew the Indonesian Communist Party (the PKI), a class-based democratic socialist movement. The PKI had come to power through a social force organized by poor citizens attempting to establish a new democracy.

The United States provided this aid to ensure that private U.S. industry would be able to exploit the oil resources of the area, and thus increase the size of the corporate oil market. The actions of the U.S. government on behalf of American corporations in Indonesia stand out, with actions in Chile and Colombia, as examples of international corporate crime.

The island of East Timor became victimized in this economic struggle for Western control of the oil. East Timor is an island located about 300 miles north of Australia and east of the Indonesia. During the colonial era, Indonesia and Timor were both occupied by Western European powers. Between the Timor Islands and Australia lies one of the world's richest oil reserves, containing as much as 5 or 6 billion barrels; thus, since the 1950s, the United States and other Western powers have attempted to wield an influence in this area.

As America began supporting the Indonesian military, Major General Suharto (sometimes spelled Suharto), the military leader, began the extermination of the PKI membership. The U.S. government often opposed class-based democratic movements on the grounds that they might interfere with the free market or multinational corporate growth. The U.S. government did so in Chile in the late 1960s and has tried to do so for years in Colombia. Suharto took over Indonesia with the help of U.S. aid in 1965, along with the assistance of other West-

ern powers. Over one-half million Indonesians, mostly poor landless peasants, were murdered over the course of just a few months. Over the next four decades, the United States trained Indonesian military forces, many of whom were also responsible for the murders of East Timorese when Suharto invaded the region in 1975.

The Indonesian government then began a 30-year project of accumulating foreign debt and Westernizing the country, with 30 percent of the World Bank loans ending up in Suharto's pockets. During the Suharto dictatorship, transnational corporations invested millions of dollars, mostly in oil extraction. The first transnational corporation to set foot in Indonesia was Freeport McMoran Copper and Gold, an American company that immediately began exploiting oil, timber, and mineral resources in a virgin forest.

Prior to Suharto's regime, Indonesia consisted of more than 30,000 different languages, over 20 ethnic groups, and a variety of religions including at least four separate Muslim groups, Chinese Buddhists, Chinese Hindus, Chinese Confucians and Christians. An elite ethnic minority called the Javanese, made up of many of Suharto's relatives, ran the nation while most of the population sank into poverty. Moreover, Chinese and Christian minorities faced widespread discrimination under this regime. The Chinese—who the early Christian colonialists had employed as tax collectors—were not permitted to use their language or worship Confucianism. They were forced to change their surnames and carry ethnic identity cards. They were also refused entry into politics and the military.

Beginning in 1974, after a revolution brought an end to Portugal's longtime colonial rule, East Timor began its movement toward independence from Indonesia. While only a minority of the movement's members wanted to remain a part of Indonesia—apparently because of the wealthy oil reserves—a majority wanted to establish an independent socialist government. In 1975, the Republic of Indonesia convinced Western powers that this socialist movement posed a communist threat to the region, and thus received Western support in its invasion of East Timor.

During the 24 years of Indonesian occupation, over 200,000 East Timorese were murdered in a genocidal campaign aimed at eliminating economic competition and civil resistance to Indonesian control. Although the United Nations Security Coun-

cil condemned the occupation, the United States and many other Western powers, including Britain and Australia, supported the occupation. U.S. policymakers provided military support by training Indonesian soldiers through funds from the International Military Education and Training Program until Congress finally banned the program in 1992. However, in 1995, a new program initiated by the Pentagon reinstated the military training regardless of the Congressional ban. Successive U.S. administrations continued to provide military arms to Indonesia for the ongoing extermination of the East Timorese. With U.S. military support, Suharto intimidated, criminalized, and murdered all opposition to his regime, and suppressed all labor movements and expressions of religious or ethnic differences. At the same time, the World Bank and Western nations including Australia, the United States, and Great Britain loaned billions of dollars to Indonesia.

#### SOVEREIGN NATION

Finally in 1999, the UN Security Council established a multinational peacekeeping force led by Australia designed to restore peace and security and to support the UN mission in establishing East Timor as a self-governing sovereign nation. However, one-third to one-half of the East Timorese population had already been murdered. In addition, Australia's late motives for involvement seemed not to revolve around humanitarian concerns but instead around oil reserves, evidenced by its earlier agreement with Indonesia to annex the oil-rich part of Timor.

The Security Council voted to prosecute the perpetrators of these crimes against humanity, and the Human Rights Commission established an International Commission of Enquiry. The commission was assigned the collection of evidence of human rights violations, but only those occurring after the January 1999 announcement of a forthcoming vote for independence. Finally, on May 20, 2002, East Timor was granted independence by the United Nations and renamed Lorosae, meaning Timor of the Rising Sun, thus becoming the first new nation-state of the 21st century.

West Timor was not so fortunate. As of 2000, over 100,000 East Timorese refugees remain under Indonesian militia control in West Timor, where violence against men and sexual violence against

women continues today. This genocidal episode used U.S. military aid provided to the Indonesian government as well as the Western corporate exploitation of Indonesia's resources. Moreover, additional murders occurred largely as the result of U.S. and Western inaction.

## industrial espionage

**INDUSTRIAL** espionage is closely related to economic espionage. According to the Federal Bureau of Investigation (FBI), the only distinction between the two forms of espionage concerns territorial issues. Whereas economic espionage refers to the stealing of trade secrets or confidential information by foreign governments against U.S. businesses, industrial espionage includes the theft of trade secrets by foreign or domestic companies against other businesses. In general, industrial espionage involves the secretive theft of corporate trade secrets or any information of potential value including formulas, patents, new technology developments, and other intellectual properties. The loss of these trade secrets costs companies billions of dollars each year.

The majority of industrial espionage offenders include the company's current or former employees. Nearly 85 percent of all industrial espionage incidents are attributed to employees. The use of computers and other technology systems including the internet has provided employees with relatively easy access to sensitive information and equipment including the company's research-and-development strategies, manufacturing and marketing plans, and customer lists. Attitudes toward the company play a crucial role in determining how well secrets are

kept. When employees become dissatisfied they are more likely to steal trade secrets. Also, former employees who had access to valuable information become lasting threats to the company's assets. For example, former employees can use confidential information to begin their own company.

## CASE STUDIES

Two former vice presidents of DoubleClick, an online advertising agency, attempted to establish a competing firm using secrets from DoubleClick including their revenue, pricing, and customer information. A retired Kodak employee established a consulting business and began recruiting his former colleagues to gather proprietary information about the 401 Machine, a device that makes the chemical compound, acetate, which is used for making photographic film. The retired employee sold these valuable confidential documents to Kodak's foreign rivals for thousands of dollars. In some instances, companies hire former employees of their competitors to obtain trade secrets. Bayer's Agfa group charged General Electric with improperly hiring a key official familiar with the company's new Picture Archiving and Communications Systems (PACs). Agfa alleged that after they declined to enter a joint venture with GE to work on the PACs project, GE aggressively pursued and hired Vishal Wanchoo, the vice president in charge of Agfa's PACs. Agfa charged that Wanchoo helped GE develop its electronic medical imaging business at the expense of Agfa's resources.

In a similar case, General Motors (GM) filed industrial espionage charges against Volkswagen after the company hired a top GM executive. Beyond hiring important former employees, nearly every major U.S. company has developed competitive intelligence teams to gather trade-secret information from competitors. These teams attend conferences and seminars as well as go to airport terminals in order to target competitor's salespeople and executives who can unknowingly reveal potentially damaging information about their companies. Other tactics of these intelligence units include targeting disgruntled employees to learn confidential information, reviewing criminal and regulatory filings, and engaging in "dumpster dives" to obtain discarded old documents of potential value.

The increased occurrence, cost, and threat of industrial espionage effectively lead to the passage

of the Economic Espionage Act of 1996 (EEA) which made the theft of trade secrets a federal offense. Under the EEA, trade secrets are broadly defined to include "all forms and types of financial, business, scientific, technical, economic, or engineering information, including patterns, plans, compilations, program devices, formulas, designs, prototypes, methods, techniques, processes, procedures, programs, or codes, whether tangible or intangible, and whether or how stored, compiled, or memorialized physically, electronically, graphically, photographically, or in writing." The EEA also stipulates that the owners must take "reasonable measures" to keep confidential information a secret. If owners fail to safeguard proprietary information, no one can be rightfully accused of stealing it. Finally, the Act requires that the trade secrets must have some form of actual or potential economic value.

## ECONOMIC ESPIONAGE ACT (EEA)

The EEA is a combination of sections 1831 through 1839 of the U.S. Codes. The Domestic Trade Secret Theft statute, or Section 1832, states that anyone who knowingly converts or conspires to convert an unauthorized trade secret into economic benefit of anyone other than the owner is in violation of the act. This section focuses only on incidents that involve domestic espionage. Both individuals and corporations are subject to sanctions. Individuals in violation of Section 1832 are eligible to a 10-year prison term and/or a \$250,000 fine and organizations can be fined up to \$5 million.

The first prosecution under the EEA occurred on day after the act took effect. In *United States v. Worthing*, two brothers, Patrick and Daniel Worthing, were indicted for stealing confidential trade secrets from Pittsburgh Plate Glass and attempting to sell the information to Owens-Corning, a competitor of the Pittsburgh company. Almost immediately after stealing trade secrets pertaining to fiberglass formulas and blueprints, Patrick Worthing contacted the head of Owens-Corning and offered to sell the privileged information for \$1,000.

Prosecutions under the EEA have been relatively rare. As of 2003, only 37 cases have been successfully prosecuted under the act. One of the primary problems is the reluctance of companies to file criminal charges. Most companies fear the risk of publicly disclosing valuable trade secret informa-

tion through court evidence documents. In an espionage case involving Bristol-Meyers Squibb and their secret formulas for the cancer-fighting drug, Taxol, federal judges ruled that prosecutors had to release the confidential documents to the defendants' lawyers in order to protect due process rights. The defendant, Yuen Foong Paper Co, a Taiwanese company, had two employees approach an FBI agent posed as a Bristol-Meyers technology information broker, and allegedly offered him \$200,000 plus a percentage of their sales for access to Taxol technology. Bristol-Meyers appealed the ruling in an effort to protect the secrets from those accused of attempting to steal them. In this way, the EEA presents problems for the both victims and the accused. Many companies have turned to private consulting or intelligence agencies to help prevent future incidents of espionage.

## Industrial Revolution

THE INDUSTRIAL REVOLUTION of the late 18th and early 19th century marked the most profound transformation of human culture since the

agricultural revolution that had changed human society from nomadic hunting and gathering to settled agricultural communities. All aspects of human life changed during the Industrial Revolution. It transformed the economic system of production from hand tools, and handmade items to machine-manufactured and mass-produced goods, moving Europe from an agricultural and rural economy to a capitalist and urban economy, and from a household family-based economy to an industrial economy. It changed human labor, consumption, family and social structure, and even the emotional and intellectual functioning of the individual person. The abandonment of the family economy was the most dramatic change that Europe had ever seen and the world is still struggling with these changes in the 21st century.

The Industrial Revolution also marks the introduction of the "white-collar" in white-collar crime, as class delineations of professionals (white collars) and workers (blue collars) became more distinct in the industrialization of the country.

#### RISE OF TECHNOLOGY

Technological revolutions have punctuated history. In Europe during the 12th and 13th centuries, technological knowledge exploded, bringing about changes in production and labor. Methods of making glass, clocks, and chemicals advanced significantly during the 16th and 17th centuries and by the mid-18th century, the state and guild resistance to industrialization had weakened significantly in England and France. Popular interest in industrialization resembled the enthusiasm that had welcomed experimental agriculture a century earlier.

Originally, the 18th century Industrial Revolution referred to the technological developments between 1750 and 1830 that transformed Great Britain from a largely rural, agricultural population to an urban manufacturing society. This Industrial Revolution started in England because England had led the way in developing social and technological innovations. This wave of industrialization spread to other European countries and America during the 19th century, and others, like Russia and Japan, experienced their Industrial Revolutions during the first half of the 20th century.

The English Parliament inspired much of the 18th century Industrial Revolution by permitting lands, that had been held in common by tenant

farmers, to be enclosed into private farms. These enclosure laws increased agricultural production and, at the same time, increased the urban population in England by forcing many landless farmers to move into cities. The English merchant and capitalist interests firmly controlled Parliament, and it passed much legislation favoring mercantile and capitalist interests.

England acquired new overseas territory in every 18th century war that it fought, and during this time, mercantilism thrived in England. Also, England had come to monopolize overseas trade, including trade with its North American colonies. In the 1740s, one half of all British exports went to America, but England also began to control the South American and the Indian trade. All this trade produced the largest merchant marine in the world and a navy to protect this merchant marine fleet, enabling England to dominate the new capitalist economy through its navy.

Inventors also contributed to the English Industrial Revolution. The first factories appeared in 1740, and they concentrated on textile production. James Watt and Thomas Newcomen developed the steam engine, James Hargreaves the spinning jenny, Richard Arkwright the water frame, and John Kay, the flying shuttle and carding machine. From the 1790s to the 1830s, more than 100,000 power looms with 9,330,000 spindles were put into service in England and Scotland. British success with steam locomotion encouraged the building of railroads in most European countries, often with British capital, equipment, and technicians. Britain exported its railroad expertise and after 1842, France began constructing its railroad system. Russia, Canada, and the United States built railroads to link communities and move freight and passengers. In Germany, railroads helped bring about political and economic integration.

## AMERICAN INDUSTRY

America had the closest ties with Great Britain and its expanding industrial capacity. The factory system that had taken root in England revolutionized the manufacture of cotton, thread, and cloth. Improvements in weaving and spinning created a new demand for new carding devices in America as well as England. The most important innovation, steam power, developed after the appearance of James Watt's advanced steam engine patented in 1769. De-

spite the efforts of the British government to prevent the export of English industrial technology, knowledge of the new engines spread quickly to other countries, usually when people emigrated with the learned technology from British factories.

America received most of the benefits of English technology because more immigrants came to America from Great Britain than from any other country. Samuel Slater used the knowledge that he had gained in England to build a spinning mill for the Quaker merchant Moses Brown in Pawtucket, Rhode Island in 1790; it was the first modern factory in America.

The development of the steamboat brought on a new era in river transportation. Inventor Robert Fulton and promoter Robert R. Livingston were responsible for perfecting the steamboat and bringing it to the attention of their fellow Americans. The *Clermont*, equipped with paddle wheels and an English-built engine, chugged up the Hudson River the summer of 1807, demonstrating that steam navigation was the wave of the future. Legend had it that people on the bank, seeing the sparks from the *Clermont's* smokestack, thought that the devil had sailed by on a raft.

By the 1840s, steamships regularly crossed the North Atlantic. Steamship traffic increased tremendously during the last half of the 19th century and improvements in hull design, engines and fuel further increased traffic. By 1839, the propeller replaced the paddle wheel, steel replaced iron in the hull, and multi-cylinder engines appeared. After 1920, the smaller and lighter diesel engine marked another major change.

The invention of the cotton gin changed the economy of the South and helped New England entrepreneurs develop an American textile industry in the 1820s and 1830s. It also helped drive a wedge between the nation's two most populous regions, with the North became increasingly industrial and the South more firmly agricultural. This industrial division ultimately contributed to the Civil War and the eventual Union victory. Eli Whitney developed a machine to make each part of a gun according to an exact pattern.

This made it possible to divide tasks among several workers and one person could assemble a weapon out of parts made by several others. Before long, manufacturers of sewing machines, clocks, and other complicated products were using the same system.

*The steam engine helped thrust Western society into the industrial age with its burgeoning white-collar crime.*

American industry had built a solid foundation before the Civil War, but during the three decades after the Civil War the national economy raced far ahead of the steel rails of the first trans-continental railroad in 1867. The remarkable growth increased the wealth and improved the lives of many Americans. Industrial titans, some the first and most notorious white-collar criminals, and a growing middle class enjoyed prosperity without precedent in American history, but workers, farmers and others experienced poverty and social chaos.

#### MORGAN AND ROCKEFELLER

One of the most important factors leading to the post-Civil War transformation was the transforma-

tion of iron and steel production in the late 19th century. It took capitalists and monopolists like Andrew Carnegie, John D. Rockefeller and J. Pierpont Morgan to furnish the capital and knowledge to build industries like U.S. Steel, the Standard Oil Company, the banking industry, and to insure substantial American economic growth. By the end of the 19th century, as a result of corporate consolidation, 1 percent of the corporations in America controlled more than 33 percent of the manufacturing production. A system of economic organization was emerging that lodged enormous power in the hands of very few men: the great bankers of New York such as Morgan, and industrial titans such as Rockefeller, all of whom, if alive today, would be brought up on major corporate criminal charges.

Henry Ford and his mass production of the automobile in the early 20th century sparked more economic and social changes in American society. Whether or not this relentless concentration of economic power was the only way or the best way to promote industrial expansion became a major source of debate in America in the late 19th century and into the present.

#### EFFECTS OF REVOLUTION

The Industrial Revolution turned out to be a mixed technological and social blessing. It created an increase in population and urbanization and produced new social classes. England and Germany enjoyed a population growth rate of more than 1 percent annually, a rate which doubled the population about every 70 years. In the United States, the increase averaged to more than 3 percent, a rate that could have produced disastrous results if the continent had not been practically empty and overflowing with natural resources. Only the population of France remained fairly static after the 18th century. The growth of medical science and public health measures helped decrease the death rate.

The Industrial Revolution transformed the population from a rural to urban base. By the mid-19th century, half of the English people lived in cities and by the end of the century, this was also true of other European countries. Between 1800 and 1950 most large European cities enjoyed spectacular growth. At the beginning of the 19th century, there were scarcely two dozen cities in Europe with a population of 100,000 but by 1900, more than 150 cities in Europe had reached this size.

“We cannot all live in cities, yet nearly all seem determined to do so,” Horace Greeley wrote shortly after the Civil War. America’s urban population increased sevenfold in the 50 years after the Civil War, and the 1920 census revealed that for the first time a majority of the American people lived in urban areas.

Around the industrial world, middle classes expanded and, in varying degrees, came to dominate the economy of their nations. Urban living intensified conditions like poverty, lack of good housing, and class divisions. Factory towns in England and America tended to spawn tenements and the mining towns produced rows of company cottages providing little but minimal shelter. Unlike rural landlords and local aristocrats, factory owners and managers were usually remote and inaccessible and tended to regard laborers as commodities and not as human beings. They dealt with their workers impersonally and eventually there was a growing schism between the two classes. Working men and women all over the world grew to think of themselves as a distinct class with common goals and interests. Clashes with management created social turbulence.

The Industrial Revolution created a new working class that included all the men, women, and children laboring in the textile mills, pottery works, and mines. Often, skilled artisans found themselves demoted to laborers as machines began to mass-produce the products formerly made by hand. As a rule, wages were low, hours long, and working conditions unpleasant and dangerous. The nature of labor changed. It was fixed, disciplined, routinized work with a fixed and rigid schedule, a sharp contrast to the varied seasonal working pattern of the rural economy.

The industrial giants of the late 19th century in America and Europe created their own economic systems that spurred great economic growth. They integrated operations, cut costs, built a great industrial infrastructure, stimulated new markets, created jobs for a vast new pool of unskilled workers and opened the way to large-scale mass production. They also laid the foundation for some of the greatest public controversies of their era and of ours. Modern industrial cities produced great increases in pollution, crime and infectious disease as well as culture and economic opportunity. The problems of poverty, the degradation of the environment, the spectre of monopoly, the question of wages and working conditions, the struggle to unionize,

strikes—all of these creations of the Industrial Revolution are still being addressed in the 21st century.

## infant formula

**BEGINNING IN THE** early 1970s, an international scandal developed over the advertising of infant formula in developing countries. The chief objection to marketing infant formula in these countries was that it encouraged mothers to choose not to breast-feed their babies, even though medical and children’s experts around the globe, including the World Health Organization (WHO) and United Nations, were convinced of the health benefits of breastfeeding for at least the first six months of an infant’s life.

Critics argued that the use of infant formula also threatened the health and lives of children in developing countries for a number of other reasons. First, many mothers were illiterate and could not read the directions on how to correctly prepare the formula. Even those mothers who could read sometimes chose to dilute the formula to make it go further because it was expensive. Storage facilities

were often inadequate or nonexistent for the formula once it was put into bottles, so formula often spoiled. Additionally, many mothers had no way to sterilize water, bottles and nipples or to maintain sterility if it were achieved.

### QUESTIONABLE MARKETING

Critics of infant formula also claimed that mothers in developing countries were prejudiced toward choosing formula over breastmilk by a number of questionable marketing techniques. The most controversial technique was the use of “milk nurses” who were hired salesgirls dressed in white nurse-like uniforms whose only goal was to sell their employers’ products.

Infant formula manufacturers were also harshly criticized for labeling their products with photos of fat, health Caucasian babies who conveyed the message that undernourished children in developing countries would become healthier by using the imported formula. Infant formula manufacturers also freely distributed samples of their products through hospitals, doctor’s offices, and “milk nurses.” Critics were also opposed to the media blitz that included radio, television, and print advertising aimed at selling infant formula.

As the controversy over advertising infant formula in developing countries spread around the world, a flood of negative publicity resulted, including scientific reports, public statements, books, films, investigations, demonstrations, boycotts, congressional hearings, and international meetings. The climax came on May 21, 1981, when the World Health Assembly (WHA) passed the International Code of Marketing of Breast-Milk by a vote of 118 to 1. The only holdout was the United States because the Ronald Reagan administration argued that the Code restricted free trade. Senator Mark Hatfield (R-OR) accused the Reagan administration of being indifferent to the sanctity of human life, and two top officials of the U.S. Agency for International Development resigned in protest.

The World Health Organization (WHO) and UNICEF banded together to encourage mothers in developing countries to breastfeed their babies and lobbied governments in developing countries to adopt the WHA Code, which stipulated: “There shall be no advertising or other form or promotion in the general public of breast-feeding substitutes.” The WLO and UN often referred to the Central

American country of Guatemala as the ideal model for illustrating the benefits of adopting the WHA Code because the infant mortality rate dropped drastically in Guatemala after the government implemented the Infant Formula Marketing Code. All manufacturers who imported infant formula or baby food to Guatemala agreed to remove baby pictures on their labels for children under two years of age except Gerber. Gerber refused to abide by the restrictions and threatened to challenge Guatemala’s adoption of the Code through the World Trade Organization, which would have placed an unfair financial burden on the country. In 1995, the Guatemalan Supreme Court exempted imported baby food from Guatemala’s strict infant health laws.

A scandal erupted in Israel in mid-November 2003 when three Israeli infants died and several others were hospitalized after ingesting a soy-based formula manufactured by Humana, a German manufacturer. The company claimed that its failure to include vitamin B-1 in the infant formula was due to human error and accepted full responsibility for the mistake. The absence of B-1 in infant formula can cause beriberi, which in turn can lead to cardiac and neurological problems or death. Israeli authorities decided to investigate the possibility that Israeli infants had been targeted for political reasons because of resentment against the Jewish state.

### FOOD AND DRUG ADMINISTRATION

Infant formula sold in the United States is generally safe. While the Food and Drug Administration (FDA) is not required to approve infant formula before it is released, the Infant Formula Act requires that manufacturers of infant formula provide the FDA with certain information before a new formula can be released on the market.

This information includes nutrient levels and extensive test data on the product. Congress has also given the FDA the authority to create and enforce standards on all infant formulas that are sold commercially. Despite the best intentions of the FDA, counterfeit formulas are occasionally released on the market. The FDA recommends that parents do not feed their infants any formula with an unusual color, smell, or taste, or any which contains an outdated expiration date.

Because FDA regulations require that every batch of infant formula sold in the United States

contain an identifying number, the task of recalling formula when a problem occurs is facilitated. For instance, in November 2002 Wyeth Nutritionals, Inc. recalled an entire batch of infant formula that had been distributed nationwide due to the possibility that the formula was tainted with *Enterobacter sakazakii*, which can cause severe intestinal infections or meningitis (inflammation of the brain), which can lead to death in newborns.

In the summer of 1997, authorities uncovered an international black market for infant formula operating out of Fort Worth, Texas. Ten locally-owned convenience stores were paying drug addicts from \$6.00 to \$9.50 per can to shoplift cans of infant formula. The cans were then placed in boxes that were fraudulently labeled Enfamil, Isomil, and Similac, the names of legitimate infant formula manufacturers. Some cans were sold domestically for \$12 to \$16 a can.

More often, the cans of formula were sold internationally, particularly to Arab countries, for up to \$40 a can. Authorities in Fort Worth seized 1 million cans of the fraudulent infant formula and 100,000 packing boxes. They then froze bank accounts of suspected participants in the black market ring.

## insider trading

IN MOST JURISDICTIONS, insider trading can be legal, or illegal. Legal insider trading occurs when corporate insiders buy and sell stock in their own companies. When corporate insiders trade in their own securities, they must report their trades to the securities regulator. Illegal insider trading, a type of white-collar or corporate crime, refers to situations where a person deals on the basis of price-sensitive information which is not in the public domain. And at the time of the dealing, the information is likely materially to affect the price of the securities being traded. Two main types of illegal insider trading exist: the use of insider information by an insider for self enrichment, and the leaking of information by an insider to a third person (tipping), causing the third person to engage in illegal trade practices.

Illegal insider trading exists worldwide and affects all financial markets. It is one of the major challenges of our time. Millions of dollars have been involved in big insider-trading cases. Although the phenomenon of insider trading is not new and arguments against it existed in the early years of the past century, it did not become a major interest of the media and the public until recently. Since the 1980s, insider trading has increasingly become a hot topic. Some scholars refer to it as “the representative white-collar crime of the 1980s.” The increasing media reports of business morality cases in securities markets makes the topic of insider trading even more popular among the public.

#### ANTI-REGULATION

It is certainly not universally agreed that insider trading should be prohibited. Some economically oriented scholars argue that regulating insider trading is wrong. They assert that insider trading is a constructive form of compensation for entrepreneurs or managers and thus makes the market more efficient. They argue that insider trading is a sort of compensation scheme for entrepreneurs who produce information, and believe that long-term investors will not be hurt by the practice.

The entrepreneur is vital to the development of the corporation and must be encouraged to continue to produce information. Otherwise, the entrepreneur will “disappear from the corporate scene.” The supporters of insider trading also argue that insider trading enables quicker dissemination of good or bad news and incorporates information into the

share price more quickly, thus allowing all investors to react more quickly. If insider trading was legal, this group argues, insiders would bid the prices of stocks up or down in advance of the information being released. The result is that the price would more fully reflect all information, both public and confidential, about a company at any given time. Even if insider trading sometimes creates more harm than good, rules against it could be contractual rather than mandated by government, because insider trading is a kind of “private ordering” or employment contract between the corporation and its shareholders. Advocates say the government should not intervene in the private contract by regulating insider trading practices.

#### PRO-REGULATION

Regulation proponents have formulated the best reply to these arguments. They argue that remuneration of entrepreneurs is a matter of contract between them and the corporation. Explicit executive compensation schemes are fully capable of compensating valuable hard-working managers. An insider who makes no contribution to the issuer may also profit from insider knowledge of adverse events within the corporation. There is little need to use insider trading as a compensation device to induce the managers to work hard.

Contrary to insider trading supporters, proponents of insider trading regulations argue that prohibiting insider trading will help the allocative efficiency of the market. Since prohibiting insider trading should improve the speed of disclosure, more information will then be incorporated into the market price. Rules against insider trading are not “private ordering,” because shareholders do not communicate well with each other and, therefore, will not work together to negotiate with corporate insiders to create a contract preventing insider trading.

Unlike those who focus on economic analysis, many legal scholars, criminologists, and other social scientists generally condemn insider trading and support insider trading regulations. The justification for regulating insider trading has revolved around issues of fairness, market confidence, and fiduciary responsibility.

The classical argument against insider trading is that it is inherently unfair for a person to use confidential information acquired by virtue of her spe-

cial status to trade to the detriment of the other party, who is ignorant of the existence of the information. Allied to this is the argument that insider trading is immoral. The clamor for insider trading regulations in the 1920s and 1930s in the United States hinged on fairness arguments. Some of the advocates of these arguments, while realizing the obvious economic benefits of allowing insider trading, contended that such benefits do not outweigh the benefits to be realized from ensuring fairness in the securities market.

Although the above arguments still find currency with a few scholars, most researchers argue that immoral acts cannot automatically be translated into illegal and criminal behaviors. Such fairness arguments are probably used as a specious cloak of legitimacy to mask the theoretical difficulties of insider trading regulation in some jurisdictions. A pertinent question is: whose morals are the regulations supposed to protect? Notions of fairness and morality are as disparate as there are interest groups to serve.

Another pro-regulators’ favorite argument is that insider trading destroys the confidence of investors in the securities market. If the market allows insider trading, the public investors will lose confidence in the securities market and will be reluctant to invest in the market. When trading on confidential information is outlawed, investors will trade with the confidence that stock prices reflect their actual value. The proper basis for regulation is, therefore, the need to preserve the expectation of fairness needed to maintain investors’ confidence in the security market.

Some authors argue that insider trading based on privileged information is a breach of the fiduciary obligations owed to the company. It is further said that allowing insider trading will lead to a conflict of interest in that insiders will be more interested in inventing and shielding information upon which they can trade instead of concentrating on the business of the company. They argue that insider trading and other offenses in securities markets are essentially the violation of trust. They maintain that trust is truly the foundation of capitalism. Based on this assumption, these authors advocate formal enforcement of securities laws to crack down on such illegality.

There is also a resistance among regulation advocates against the idea that insider trading is a victimless crime. Some scholars argue that, in an

insider-trading transaction, there is a party who loses value from the securities involved or is forced to take a loss. Thus, they prefer viewing insider trading as “a crime with an unknowing victim.” Some researchers have identified victim populations in their study and find that they were mostly individual stockholders at the time of victimization. Many proponents of stronger insider-trading laws argue that, even though it is difficult to show a direct causal link between the activities of the insider, the decision of the outsider to deal and the loss incurred, it might still be possible to regard the outsider as a victim of an informational advantage.

## REGULATION STATUTES

A combined approach may reconcile the tense debate between regulation proponents and opponents. Fairness, market confidence, and economic efficiency should all be considered before an appropriate model of regulation is adopted. To achieve fairness and market confidence, formal regulatory measures may serve the long-term interests of society. To attain temporary market efficiency, a self-regulation system such as a “Chinese Wall,” which is aimed at stopping the flow of information from one department in a corporation to another, may be adopted.

The legal attitude toward insider trading in history has obviously reflected a *laissez-faire* philosophy instead of a government control approach. The illegality of insider trading on non-public information had not been established until the early 20th century. In the United States before 1909, for example, there was no legal obligation for an insider trader to disclose nonpublic information. The only exception was the case of fraud that was not easy to prove. The adoption of “blue sky laws” in early 1900s, however, required the full disclosure of material nonpublic information. In the leading case of *Strong v. Repide* in 1909, the U.S. Supreme Court established that a company official is obliged to disclose her identity and nonpublic information when she trades the company stocks. Section 10(b) and Section 16 of the Securities Exchange Act of 1934, the landmark U.S. Supreme Court case of *SEC v. Texas Gulf Sulphur* in 1968, and the following cases made further legislative and judicial confirmation of the illegality of insider trading on privileged information. Similarly, in other jurisdictions like Canada, Britain, and Australia, legislation was even-

tually introduced that made trading on insider information a crime, although they may regulate insider trading in different ways.

The regulation of insider trading in the United States rests primarily on section 16(b) and section 10(b) of the Securities Exchange Act of 1934. Section 16(b) prohibits short-swing insider-trading profits (profits realized in any period less than six months) by those most likely to be privy to material nonpublic information. It applies only to directors or officers of the corporation and those holding greater than 10 percent of the stock. Section 10(b) makes it unlawful for any person “to use or employ, in connection with the purchase or sale of any security registered on a national securities exchange or any security not so registered, any manipulative or deceptive device or contrivance in contravention of such rules and regulations as the [SEC] may prescribe.”

Section 10(b) of the Securities Exchange Act of 1934 is a broad anti-fraud provision, which generally prohibits fraud or misrepresentation in connection with the purchase or sale of a security. Rule 10b-5, promulgated under section 10(b) in 1942 by the Securities and Exchange Commission (SEC), is a more comprehensive anti-fraud provision used as the major weapon to curb insider trading in the United States. It simply prohibits any person from committing any fraud in connection with any securities trading. Congress did not specify the definition of insider trading as a fraudulent act. Instead, Congress left this for the courts to interpret. The lack of a clear legislative definition allows the SEC to construct its own interpretations, subject to judicial scrutiny. It is on the basis of these provisions that the courts and the SEC has exercised its authority to make the most important developments in insider-trading law in the United States.

The civil and criminal penalties for insider trading are also included in the Securities Exchange Act of 1934. First, there are private civil remedies, as found in section 20(a) of the 1934 Act. Persons who are harmed by insider trading can bring actions in most circumstances to recover the illegal profits (or avoided losses) enjoyed by wrongful traders in contemporaneous trading. Furthermore, the SEC has the authority to impose criminal penalties, civil penalties, and punitive civil awards against wrongful traders.

The lack of successful enforcement efforts by the SEC from the enactment of Rule 10b-5 to the

late 1970s led the SEC to formally request that Congress increase the civil penalty for insider trading. The Insider Trading Sanctions Act of 1984 gives the SEC the power to seek additional remedies in insider trading cases. The 1984 act also increased the maximum amount of the fine from \$10,000 to \$100,000.

The Insider Trading and Securities Enforcement Act of 1988 broadened the scope of illegality by imputing civil liability to “controlling persons” for the violations of their employees, or “controlled persons.” The maximum penalty for criminal violation has been increased from five years to 10 for imprisonment, while the maximum fines for individuals increased from \$100,000 to \$1 million and was increased against non-natural persons (for example, corporations, exchanges, etc.) from \$500,000 to \$2.5 million. The SEC is empowered to award bounties of up to 10 percent of penalties recovered, through litigation or settlement, to informants who provide information leading to successful enforcement actions against insider traders.

The SEC was created by section 4(a) of the Securities Act of 1934 to enforce the U.S. securities regulation. Under the securities laws the commission can bring enforcement actions either in the federal courts or internally before an administrative law judge. It is the most powerful securities regulator in the world. Since the depths of the Great Depression, the SEC has tried to prevent insider trading in U.S. securities markets. The number of insider-trading enforcement actions brought by the SEC increased dramatically in the 1980s. A U.S. General Accounting Office Report states that there were only 53 insider trading cases brought by the SEC from 1934 to 1979, while 177 cases from 1980 to 1987. The pursuit of high-profile insiders in the late 1980s, starting with the prosecution of Dennis Levine at Drexel Burnham Lambert, has instilled in the public a sense of justice.

Because insider trading undermines investor confidence in the fairness and integrity of the securities markets, the SEC has declared the detection and prosecution of insider trading violations as one of its enforcement priorities. About 45 insider-trading cases are pursued every year. The SEC brought 57 cases alleging insider trading in 1997 alone. For the most part, however, most of the offenders caught today are employees pocketing a quick \$5,000 after buying shares of a company’s stock before a merger. Furthermore, criminal prosecutions

for insider trading tend to be fewer and difficult to win, partly because it is rather difficult to prove what the accused actually knew at the time the trades were made. Insider trading is usually committed by the wealthy and powerful, who can afford the best lawyers and have rich resources to drag a case out and cost the prosecutors millions along the way. Given the court’s scrutiny of insider trading cases, the SEC’s role as enforcer is made more difficult.

## INTERNATIONAL REGULATION

The American style of insider trading regulation has set a major global trend and has been adopted especially by Japan, Taiwan, South Korea, the Philippines and some countries that have recently developed their securities markets, such as China. Insider trading prevails in these countries, with politicians among the main beneficiaries.

These countries, for the most part, copied securities regulations from the United States. Some provisions are even stricter than the U.S. regulations on paper. Although these countries have made efforts to tighten insider trading regulations, there have been only a few cases under these regulations. The borrowed insider-trading regulations still do not work well in their own jurisdictions, partly because there is no effective independent regulator in these nations.

There are two major styles of insider-trading regulations other than the U.S. style in the world, both originated from the European countries. The UK style can be found in the United Kingdom, the Republic of Ireland, Australia, Hong Kong and other Commonwealth jurisdictions. The continental European countries’ style is adopted by most civil law jurisdictions in continental Europe. The European countries have tried to harmonize their insider-trading regulations, which were formalized in the European Community Directive Coordinating Regulations on Insider Trading, adopted on November 13, 1989 (the EC Directive). The EC Directive arose out of the 1957 Treaty of Rome establishing the European Economic Community, which mandated creating a single internal European financial market.

At the time the directive was passed, however, four of the 12 members of the EC (West Germany, Belgium, Italy and Ireland) had no insider-trading legislation on the books and the remaining eight members (France, England, Luxembourg, the

Netherlands, Denmark, Greece, Portugal and Spain) had widely varying statutes. The directive set up a minimum standard of insider-trading regulations and required all member states to follow it.

The statutes are, nonetheless, not self-enforcing in practice. Germany and Italy, for example, have traditionally viewed insider trading as an acceptable market practice. Insider trading is an extraordinarily difficult crime to detect and prove, especially in the cultures where insider trading is not considered a crime. There has not been a significant insider-trading case brought by the regulators either in Germany or Italy. In 1998, Dutch authorities enacted its new law providing for criminal penalties only against insider trading. Although the statute is regarded as the "toughest in the world," Dutch prosecutors have made only one insider-trading prosecution in the last 15 years.

The UK was one of the first European countries to enact laws against insider trading. The Company Securities (Insider Dealing) Act of 1985 (IDA1985), making insider trading a criminal offense, is designed primarily to prevent corporate insiders, quasi-insiders (anyone who has a professional or business relationship with the issuer, and public servants or former public servants) and tippees, from insider trading. Under IDA1985, a person convicted of insider trading may be sentenced up to six months in jail or receive a fine not exceeding the statutory maximum or both. If the person is convicted of insider trading upon indictment in the Crown Court, he can be sentenced up to seven years or to an unlimited fine or both. It should be pointed out that, however, the enforcement record has been disappointing. Since IDA1985, the conviction rate under the law has been rather low at only about 50 percent. Some authors argue that the low conviction rate of insider trading is the fault of the too tightly drawn definition of "insider" in the UK statute.

Many commentators attribute the low conviction rate of insider trading to the fact that insider trading is only a criminal offense in the UK, making successful prosecutions very difficult. They argue for the U.S. style that has used a combination of the criminal as well as the civil approach in dealing with insider trading cases, because the burden of proving a purely circumstantial case is less onerous in the civil context. Furthermore, it has been criticized that enforcement and regulation powers were spread among separate front-line regulators respon-

sible for particular sectors of the market, which may affect effective enforcement.

Legal reform is called to enforce laws against insider trading offenses. In May 1997, the chancellor of the exchequer announced the reform of financial services regulation in the UK and centralized enforcement powers in the UK's Financial Services Administration (FSA), which has far-reaching new powers to crack down on insider trading, including the power to impose unlimited civil fines for insider trading. The FSA was given statutory powers by the Financial Services and Markets Act 2000. The FSA, modeling itself on the SEC, has subpoena power, the power to punish non-cooperation and to order wrongdoers to make restitution. To date in early 2004, the FSA has barely scratched the surface of insider trading, and thus has a long way to go against the wayward insider traders.

Today, many countries have a consensus on the need to reinforce insider-trading regulations, because insider trading will damage investors' confidence in the securities market. While the globalization of the securities markets has enabled insider trading to become a very natural international practice, it is even more difficult for securities regulators to pursue transnational insider trading cases. Some countries have bank secrecy legislation or blocking statutes to prevent foreign regulators from acquiring necessary information for an insider trading case. Even the powerful and aggressive SEC has been frustrated by foreign authorities for enforcement cooperation. Current international agreements and treaties serve little use for investigating transnational insider trading cases. The Memorandums of Understanding (MOUs) signed between countries help deal with such cases, but not every country has an MOU with another country regarding mutual assistance on investigating transnational cases.

## Insider Trading Sanctions Act

IN AN EFFORT to curb insider trading, the Insider Trading Sanctions Act (ITSA) was signed into law by President Ronald Reagan on August 10, 1984. ITSA amends the Securities Exchange Act of 1934 which reflects a longstanding concern with fair and equitable markets. According to the Securities and Exchange Commission's (SEC) Division of Enforcement, insider trading is the most difficult and most serious challenge they face. Curiously, neither the Securities Act (1933) nor the Exchange Act define insider trading, forcing the SEC to construct various legal theories on the basis of the general anti-fraud provisions of these acts.

Reflecting this longstanding perspective on flexibility in defining insider trading, Congress (in its deliberations for ITSA) took no action in defining the term but favored continuing to give the SEC the widest possible flexibility in dealing with potential new versions of insider trading schemes. Both ITSA and its 1988 counterpart, Insider Trading and Securities Fraud Enforcement Act (ITSFEA), are designed to curb trading on "inside information"—the use of confidential information entrusted to insiders and not available to the investing public.

ITSA increased the sanctions under the Exchange Act for insider trading violations with the possibility of a civil penalty equal to three times the profit gained or loss avoided against persons who unlawfully traded in securities while in possession of material non-public information, or who unlawfully communicated such information to others

who then traded (that is, on the basis of that information or tip). ITSA also increased from \$10,000 to \$100,000 the maximum criminal fine for any violation of the Exchange Act (which was later moved to \$250,000 by the Criminal Fine Improvements Act).

### PUNITIVE THRUST

The General Accounting Office (GAO) specifically points to the ITSA's "punitive thrust" in that, prior to 1984, the civil monetary sanction was only remedial and required that the insider give back any profits realized or losses avoided. SEC enforcement officials also cite the combined impact of ITSA with ITSFEA with the latter extending the scope of civil penalties (controlling persons who fail to take measures to prevent insider trading by their employees). However, these officials also cite the high threshold of proof for the commission to establish, given the complexity of these dealings and the many routes of access to inside information (for example, lawyers, accountants, and printers of legal documents).

To understand ITSA's impact, an assessment of the past enforcement activities of the SEC can aid in evaluating its ability to use available sanctions and remedies. SEC enforcement officials cited the continuing impact of act well into the 1990s in celebrated insider-trading cases surrounding large corporations like Pillsbury. Reflecting the broadened SEC authority, there was a dramatic increase between 1978 and 1985 in insider-trading cases and the GAO found that the number of insider-trading cases increased dramatically in the wake of the Act—from 12 to 45, while the amount of profits surrendered by perpetrators jumped from \$2 million in 1985 to \$30 million in 1986. The immediate impact of ITSA (identified by GAO) can be observed in the jump in ITSA-specific penalties from \$158,492 in 1985 to \$3,889,269 in 1986.

A potential downside to the act anticipated by the SEC was increased resistance from defendants and respondents (to SEC investigations) because the SEC had been seeking stiffer penalties. Also, enforcement officials cite the challenge mounted by some that insider trading is ambiguously defined, and therefore shouldn't be prosecuted even though insider trading has fallen under the general anti-fraud provisions of the securities laws, and comes under the authority specifically granted the SEC (under the 1934 Exchange Act) that the commission

shall promulgate rules to determine the scope of anti-fraud liability. These types of cases do not appear to be over-criminalized.

## insurance fraud

INSURANCE IS THE PRESUMED protection against a possible loss in exchange for a predetermined fee, which assumes a fee low enough to make the purchase of insurance attractive to the purchaser, but still generating a profit for the company supplying the coverage. Insurance coverage ranges from the mundane (car, life, flood, health) to the exotic (singer's voice, athlete's arms, weather on a certain day). Both parties to an insurance transaction must be amenable to the cost of the coverage.

Insurance fraud occurs when either the seller or buyer of the policy attempts to alter the process to obtain more coverage or profits than entitled, or when third parties to the insurance coverage (for example, medical care providers, automobile repair shops, and claimants) make exaggerated or totally

fraudulent claims. Insurance fraud can involve issues of no coverage, exaggerated claims of damages, staged accidents, and falsified documentation.

Insurance-fraud costs to policyholders have been estimated as \$160 billion annually. Insurance companies have created specialized investigative units (SIUs) to combat this fraud. Their efforts are assisted by a national insurance-fraud bureau as well as by increased prosecution efforts by state prosecutors; additionally there seems to be a change in public sentiment, considering insurance fraud to be a crime rather than a way to gain equity against increasing premiums. There appears to be a correlation between tough economic times and increases in insurance fraud.

#### SELLER FRAUD

Insurance fraud from the seller side (which can involve one representative or entire companies) includes:

*Issuing coverage from non-existent companies:* policy premiums are obtained from consumers, but the policy is written against a non-existent company. The fraud is discovered when a claim is filed. This type of fraud is a planned criminal operation, often working out of "boiler room" operations (ad hoc, temporary offices). The sales are generated through the promise of exceptionally low premiums, which usually produces word-of-mouth referrals. If an accident claim is filed early in the operation, sometimes a phony claim process is begun, making partial payments so as not to reveal the fraud.

*Failure to submit premiums:* in these cases, a representative of an insurance company collects premiums from a policyholder but doesn't remit payments to the company. The customer believes that coverage is in force until a claim is refused for non-payment of premiums. This type of fraud is often caused by economic pressures upon the agent, in which she may have originally planned to use the premiums for a short-term loan, but was unable to pay the premium before a claim occurred.

*Churning:* a procedure by which an insurance company salesperson convinces customers to cancel and renew policies, not for the benefit of the customer but to generate additional commissions for the salesperson. The customer often pays more in commissions than is necessary, and receives no increase in policy value. This is a fraud type often perpetrated against older policyholders.

*Suicide disguised as accidental death is one form of insurance fraud.*

*Seller fraud involves pushing buyers to acquire inappropriate coverage.*

*Viatical fraud involves brokering policies to obtain immediate cash.*

*Inappropriate coverage:* in these cases, sales representatives convince policyholders to obtain policies for which they may already have coverage or for coverage that they do not need.

#### BUYER AND THIRD-PARTY FRAUD

Insurance fraud from the buyer and from the third-party side includes:

*Life insurance coverage—post-dated policies:* these life insurance policies are obtained after the death of an insured, with or without complicity from a salesperson. A policy is post-dated to show coverage prior to the death of the insured. In some cases, the insurance agent has said the intent wasn't personal gain but to assist the family; regardless of the intent, the action is criminal fraud. Other cases were simply conspiratorial frauds, between an agent and a family member of the deceased, to illegally obtain policy proceeds from the carrier.

*Fraudulent medical history:* an applicant falsifies medical history information to acquire coverage for which she would not normally qualify. The falsification could be a failure to list a pre-existing medical condition or submission of fraudulent documentation. The insured would hope to obtain health insurance coverage for a "reasonable" price, that is, not what a person with a pre-existing illness would pay if a policy was available; hoping that falsification of medical history would not be discovered.

This action would be similar to the under-reporting of total miles driven on an application for automobile coverage.

*Murder for insurance proceeds:* a life insurance policy is exercised on an unsuspecting party, so that the later intentional death can be exploited for profit. These cases include incidents where the policy was originally secured with no criminal intent (spouse, business partner, family member) but the insurance coverage later became a factor in the insured's death; and cases in which the policy was secured with criminal intent already planned, obtaining coverage with murder as precipitating factor for securing the policy.

*Lack of insurability:* a policy is taken out on an individual whom the policy-holder has no insurable interest in the individual. In these cases, an individual claims to have an insurable interest (family member, dependent, business partner) and proceeds to purchase insurance coverage, especially when the insured's death is forthcoming. The insured's death may be of natural causes rather than an intentional act. The person securing the policy is assuming that the policy proceeds will outweigh the policy costs.

*Suicide disguised as accidental death:* a case in which a person wants to commit suicide and still obtain insurance proceeds for family members. In some cases, local medical examiners and coroners are complicit in these frauds as they know the fami-

lies are in need of the proceeds, or respond to religious or societal pressures from family members or friends. Usually, there is no conspiracy between the insured and the medical examiner. The insured hopes to disguise the intentional nature of death, while the medical examiner decides to classify the death as a suicide out of compassion. In most jurisdictions in the United States, the coroner/medical examiner determines the cause of death, and if the ruling is accidental or natural there are no grounds for a police investigation.

*Faked death:* a case in which a person desires to fake his death but obtain insurance proceeds for either himself or his survivor(s). Often, these cases involve an insured with criminal charges pending. The staging of death accomplishes two goals, financial assistance to the family and termination of the criminal investigation. This case type also involves the filing of claims in which no death actually occurred, as noted in several cases resulting from claims made in the 2001 World Trade Center collapse. Some prosecuted cases involved claims on family members who were dead, and others were filed on non-existent persons.

*Viatical fraud:* viaticals are companies that broker life-insurance policies obtained from policyholders who require a quick cash settlement to pay current medical bills, to investors who, in turn, purchase them for less than face value. The majority of viaticals involve terminally ill insureds. In return for the immediate cash settlement to the policyholder, the investor receives the face value of the policy when the insured dies. Frauds occur when healthy insureds falsify medical records to obtain viatical settlements. If fraud is discovered within two years of the policy date, the policy can be revoked.

## PROPERTY FRAUD

Insurance property fraud involves:

*Staged car accidents:* one or more persons stage automobile accidents and file insurance claims for property as well as personal injuries, with some injuries exaggerated by intentional infliction of trauma. In this fraud type, all drivers are involved, often rotating the role of victim and at-fault driver. These cases often involve rental cars that have been rented with full insurance coverage. To enhance the total dollars awarded, perpetrators of this scam have been known to inflict personal injuries upon themselves if the collision didn't produce the de-

sired effects, including pulling out teeth with pliers and breaking their own arms.

*Intentionally caused car accidents:* cases in which unsuspecting motorists are "forced" into having accidents. Due to skillful driving by co-conspirators, an innocent victim has an accident with another member of the conspiracy, but reconstruction of the accident by the police will show that the unsuspecting motorist was the one who "caused" the accidents. False testimony is sometimes offered by the co-conspirators to strengthen the case against the victim. (This fraud type is also used in liability claims.)

*Non-coverage falsification:* these are cases in which insurance coverage is alleged, even though the claimant knows that no coverage was in effect. This case type may include damages resulting from uncovered damage, but a fraudulent claim is presented under another coverage source, that is, a homeowner accidentally destroys her computer system and files a police report that the computer was stolen in a burglary.

*Arson for profit:* cases in which a property owner intentionally destroys his property and files an insurance claim to recover the insured value of the policy. This fraud type can concern cases in which the policy was purchased with the plan of arson already in place, or cases in which dire economic or personal reasons caused a policyholder to contemplate arson after the purchase of the policy.

*Fraudulent criminal loss:* a case in which a claim is made for fictitious losses resulting from an alleged crime, that is, claiming a non-existent expensive watch during a robbery, or made-up property from home during burglary. This case type involves insureds who want to "recoup" their deductible, and others who falsify the event in order to collect money.

## WORKER COMPENSATION FRAUD

Insurance fraud against worker compensation plans include:

*Lack of coverage:* these are cases in which an employee is injured in a situation not covered by worker compensation coverage, for example, fooling around, injury occurring off duty, or an intentional act; but the employee proceeds to claim that the injury did occur as part of her employment and qualifies under worker compensation coverage. This case type often involves persons who did not

acquire personal health insurance and sustained an injury (an accident) that required attention.

*Exaggerated injuries:* in these cases, persons injured in a legitimate worker compensation accident present claims for exaggerated damages, often supported by false testimony from medical specialists. In some cases, insured persons receiving worker compensation benefits are found performing employment tasks (lifting, reaching, etc.) at “under the table” cash jobs. Some worker compensation claimants attempt to justify their actions by arguing that the amount of payment (usually 66 percent of base pay) is not sufficient to live on.

*Premium fraud:* employers falsely under-report the number of employees on the payroll to reduce worker compensation premiums, increasing the risk to the carrier without a premium offset. Additionally, in some incidences, to lower the number of reported claims, employers may entice injured employees not to file accident reports, sometimes through compensation and sometimes through threats of termination.

## LIABILITY FRAUD

Insurance fraud involving liability includes:

*Staged accidents:* cases in which persons stage accidents to make a claim against a third party, on the assumption that insurance coverage is in effect and the claim will be settled to avoid extensive legal fees, such as an intentional slip-and-fall in a business. Some fraudulent liability claimants have documented histories of incidents of unwitnessed injuries, or witnessed only by friends or family.

*Exaggeration of injuries:* persons injured in an accident present claims for exaggerated damages, often supported by false testimony from medical specialists. The actual injuries are often inflated to produce higher settlements or to push for a faster settlements, before the injuries “worsen.”

*Paper accidents:* cases in which no accidents occurred, yet falsified documents are submitted to show proof of damages and loss (also used with property claims.) These cases often involve complicit police and medical personnel, and attorneys.

## DISABILITY, UNEMPLOYMENT FRAUD

These specific insurance fraud cases include:

*Falsification of coverage:* a case in which a person desiring medical treatment yet has no coverage, as-

sumes the identity of a person who does have coverage (with or without the knowledge of the insured person). Additionally, some elaborate frauds have set up phony call centers to verify coverage of the “insured” to the hospital.

*Disability claims, fraudulent disability claims:* cases in which holders of disability policies exaggerate the extent of their illnesses to receive compensation for additional periods of time. The exaggeration may be purely subjective in nature (“my back still hurts”) or forged documentation may be provided in an attempt to objectively verify the exaggeration.

*Unemployment compensation, concealment of employment:* cases in which a person originally entitled to unemployment benefits fails to disclose his non-eligibility (new employment) and receives both unemployment benefit payments as well as a salary. Again, fraudulent claimants attempt to justify their actions arguing the weekly payments are too low keep up their lifestyles.

## HEALTHCARE FRAUD

Insurance fraud in the healthcare industry can include:

*False statement of service rendered or goods provided:* cases in which medical treatments delivered to patients are mis-stated to the insurance carrier. This fraud type sometimes involves “upcoding,” in which one procedure billed includes more items than what was delivered to the patient. This could involve billing for a more comprehensive series of tests than the ones actually performed. Mis-statement may involve cases in which actual services were rendered but over-billed, or cases in which the record of treatment was totally fraudulent. Patients may have been seen for another complaint, and fraudulent treatments were noted on their charts, or cases where no patient was present but billing was produced for fictitious services.

As with some other fraudulent insurance cases, offenders argue that their actions were to compensate them fairly. In January 2003, the attorney general of New Jersey reported the arrest of a drug and alcohol rehabilitation and substance abuse counselor with multiple counts of healthcare fraud, alleging more than \$500,000 in fraudulent billing to Medicaid over an 18-month period. It was alleged that none of the billed services ever occurred, nor had any of the “patients” ever been to the coun-

selor; the patients' names and recipient identification numbers were obtained fraudulently.

*Unreasonable rates:* in these cases, healthcare organizations charge rates in excess of their contracted markups, claiming a higher cost level than the actual costs. In other cases, the rates are fraudulently increased through "unbundling," which involves splitting a comprehensive charge into two separate charges that generate a higher price. While the services were rendered together as noted by the comprehensive charge, the insurance company is billed for two separate procedures, each with their own markup.

*Unnecessary treatments:* in these cases, unnecessary treatments are delivered to the patient by the healthcare provider even though there were no medical indications that the services were required. Normally, these services provide no positive impact for the patient rather they simply generate additional (fraudulent) billing for the healthcare provider.

*Improper influence:* healthcare providers use certain labs, physical therapists, medications, second opinions, etc. not for the good of the patient but in return for referral fees. Kickbacks are the inducements by which secondary treatment of the patient is selected, regardless of the quality or costs.

## interlocking directorates

MAJOR COMPANIES operate under the control of steep hierarchies, with ultimate vested power, in

principle, in the board of directors. Interlocking directorates occur in situations where a particular person sits on the board or is in the top management of two or more companies. An interlock occurs when an individual serves on the board of directors of two companies (a direct interlock) or when two board members of competing companies serve in the board of a third company (indirect interlock). This concept, in the way it is often used, is considered by some as a cornerstone of western capitalism.

When interlocks occur, there is the potential for cohesiveness, common action, and unified power. This is one of the mechanisms that promotes ever-increasing concentration of the size and power of large corporations. Through interlocking directorates, not only can corporations exert a tremendous amount of power individually, but there is also a potential for coordinated efforts between several corporations since the same individual will sit on several boards representing different corporations. This was common practice as early as the late 1800s and early 1900s.

The use of interlocking directorates is a means of monopolizing the market by giving control over competing companies to the same group of people. This is a collusive practice that strengthens the cohesiveness among well-connected organizations. Compared with cartels, trusts, joint-venture and licensing agreements, interlocking directorates are highly influential, fluid, relatively invisible and hence less open to public scrutiny.

The apparent frequency of these relationships is hardly surprising given the logic of choosing directors with knowledge and experience. The problem arises when an individual simultaneously serves as an officer or director of two competing companies and he/she stumbles across a prime opportunity for collusion, for example, coordination of pricing, marketing, or production plans of the two companies. If such coordination occurs, both the competing corporations and the interlocking director (or officer) could face serious criminal and treble-damage civil liability for price fixing or similar offenses under the Sherman Antitrust Act.

Studies of interlocking directorships go as far back as the Pujo Report (U.S. Congress, 1913), a Congressional investigation into corporate concentration. Control through interlocking directorships is a practice widely recognized by historians of the early 1900s. Investment bankers put representatives

on the corporate boards of corporations they controlled. President Woodrow Wilson campaigned against these “trusts” during 1912 and asked Congress to ban interlocks. The Clayton Act in 1914 prohibited interlocking directorates under all circumstances, regardless of their effect on competition and since then it has been the primary enforcement tool to prevent anti-competitive collusion resulting from interlocking directorates.

Although the Clayton Act filled holes in existing legislation, it too had some loopholes. The prohibition of interlocking directorates specifically dealt with obtaining director positions through stock acquisitions. Unfortunately, this left the possibility of gaining director positions through asset acquisitions for the trusts. While largely unchanged since 1914, the law was updated in 1990 to plug some loopholes and create some safe-harbors.

For example, G. William Domhoff, by analyzing the socio-economic characteristics of leading members of influential institutions from 1932 to 1964, documents interlocking directorships in extensive detail, showing that major banks, corporations, foundations, and insurance companies have boards that share not only clubs and universities, but, in many important cases, are actually made up of many of the same people.

In actuality, corporate governance has become corrupted, with chief executive officers typically appointing the board instead of the reverse. Highly interlocked corporations, such as Verizon Communications International, SunTrust Banks Inc. and J.P. Morgan Chase & Co., are well positioned to exercise a certain measure of influence over the corporate community, and to informally enforce some degree of ideological discipline.

Due to the strong potential for collusion and the emergence of anti-competitive practices and the increase of political leverage that can result from interlocked directorates, they were made illegal in the United States in the early 20th century among competing businesses. Unfortunately, especially in the case of the media, they aren't currently illegal among non-competing corporations. There's nothing, for example, to prevent a major corporate advertiser from sitting on the board of a media company it advertises with. Also, the concentration of ownership tends to reduce the diversity of media voices and puts great power in the hands of few companies. Conflicts of interest inevitably interfere with newsgathering.

Interlocking directorates are only one means by which corporations exercise political and economic influence. One example is the military-industrial complex which refers to the circulation of individuals between the government, industry, and the military. The study of interlocking directorates can be essentially classified into four groups according to the emphasis on control, collusion, discretion and/or social embeddedness. Most often, theorists generally see board interlocks as a strategy to reproduce class advantage and further exploit workers and/or consumers. The interlock arrangements benefit the interlocked companies by reducing competition through the sharing of information and the coordination of policies.

In the early 2000s, a great number of board members left seats that required greater time commitments and others dropped positions to avoid interlocks. In some cases, there is no evidence of wrongdoing but the worldwide diffusion of corporate governance, guidelines, and the adoption of the Sarbanes-Oxley Act in the United States led to the need for more independent directors and avoiding potential conflicts of interests.

## internet fraud

THE INTERNET OFFERS a global marketplace for consumers and businesses. Internet fraud refers generally to any type of scheme that uses one or more components of the internet—such as chat rooms, e-mail, message boards, or websites—to present fraudulent solicitations to prospective victims, to conduct fraudulent transactions, or to transmit the proceeds of fraud to financial institutions or to others connected with the scheme. Opportunists have begun to recognize the potentials of cyberspace.

The same scams that have been conducted by mail and phone can now be found on the World Wide Web and via e-mail. Many times, it is hard to tell the difference between reputable online sellers and criminals who use the internet to rob people. With the explosive growth of the internet, and e-commerce in particular, online criminals try to present schemes in ways that look, as much as possible, like the goods and services that many legitimate e-commerce merchants offer. In the process, they not only harm consumers and investors, but also undermine consumer confidence in legitimate e-commerce and purchasing products using the internet.

The types of internet fraud are limitless. The most common (in alphabetical order) include: advance fee loans; bogus credit card offers; business opportunities; buyers clubs; charity scams; computer equipment and software; credit card loss protection; credit repair; online escrow tips; general merchandise sales; information/adult services; internet access services; investment scams; job scams, magazine sales, Nigerian money offers, online auctions; prizes and sweepstakes; pyramid and multi-level marketing; scholarship scams; travel fraud; and work-at-home scams.

According to Fraud Watch, in 2002, online auction fraud skyrocketed, making up 90 percent of all reported internet crimes. These schemes, and similar schemes for online retail goods, typically purport to offer high-value items—ranging from Cartier watches to computers to collectibles such as Beanie Babies—that are likely to attract many consumers. These schemes induce their victims to send money for the promised items, but then deliver nothing or only an item far less valuable than what was promised (for example, counterfeit or altered goods).

General merchandise and Nigerian money offers accounted for 10 percent of the internet frauds reported. Computer equipment/software and internet access services, work-at-home plans, information and adult services, travel and vacation scams, advance-fee loan schemes, and prizes and sweepstakes scams rounded out the top 10, each accounting for .1 percent to .5 percent of the most reported internet crimes. Victims were of all age ranges, with 78 percent of the fraud victims between the ages of 20 to 49. California had the most victims, with New York, Texas, Florida, and Pennsylvania all in the top five.

Investment frauds usually fit into one of the following categories: the pump and dump, the pyramid, the “risk-free” fraud, and off-shore frauds. The pump-and-dump scam uses messages posted online that urge readers to buy a stock quickly, or to sell before the price goes down. Often the person will claim to have “inside” information or to use a “foolproof” combination of economic and stock market data to pick stocks.

In reality, they are fraudsters (many of them teenagers) who stand to gain by selling their shares after the stock price is pumped up by gullible investors. Once these fraudsters sell their shares and stop publicizing the stock, the price typically falls and investors lose their money. Fraudsters frequently use this ploy with small, thinly traded companies or penny stocks that are not listed on NASDAQ or Dow Jones, because it is easier to manipulate a stock when there is little or no information available about the company.

For example, in one federal prosecution in Los Angeles, the defendants allegedly purchased, directly and through a third party, a total of 130,000 shares in a bankrupt company, NEI Webworld, Inc., whose assets had been liquidated several months earlier. The defendants then allegedly posted bogus e-mail messages on hundreds of internet bulletin boards, falsely stating that NEI Webworld was going to be taken over by a wireless telecommunications company.

At the time of the defendants’ alleged purchases of NEI Webworld stock, the stock was priced between 9 cents and 13 cents a share. Ultimately, in a single morning of trading, NEI Webworld stock rose in 45 minutes from \$8 per share to a high of \$15-5/16, before falling, within a half hour, to 25 cents per share. The defendants allegedly realized profits of \$362,625. This may not seem like an

enormous amount, but just imagine the potential if this was done several times or with more victims.

#### SPAM AND MORE SPAM

“How To Make Big Money From Your Home Computer!!!”: These messages usually arrive via spam e-mail. The promoters send millions of these messages claiming that investors can “turn \$5 into \$60,000” in an extremely short period of time. These schemes typically require the individuals to pay anywhere from \$35 to several hundred dollars or more, but fail to deliver the materials or information that would be needed to make the work-at-home opportunity a potentially viable business. These programs are nothing more than an electronic version of the classic pyramid scheme in which participants attempt to make money solely by recruiting new participants into the program.

The “Risk-Free” fraud also usually arrives via unsolicited e-mails. They offer the customer the opportunity to participate in exotic-sounding investments, such as wireless cable projects, prime bank securities, and eel farms. Absolutely no investment is risk-free, and sometimes the investment products touted do not even exist: They are purely fictional and merely scams. In a federal prosecution in San Diego, California, a major fraudulent scheme used the internet and telemarketing to solicit prospective investors for so-called “general partnerships” involving purported “high-tech” investments, such as an internet shopping mall and internet access providers. The scheme allegedly defrauded more than 3,000 victims nationwide of nearly \$50 million.

Internet frauds are not confined to perpetrators in the United States; many of the scams that exist today originate in other countries. Off-shore frauds were at one time very expensive to commit via the telephone or mail, but with the ever-expanding internet, these frauds are now becoming very cost effective. It is very difficult, if not impossible, for U.S. law enforcement agencies to investigate and prosecute foreign frauds. The Securities and Exchange Commission (SEC) actively investigates allegations of internet investment fraud and, in many cases, has taken quick action to stop scams, but because the frauds can originate outside the United States, there is only so much the SEC can realistically do.

The Internet Fraud Complaint Center (IFCC) is a joint project of the Federal Bureau of Investiga-

tion (FBI) and the National White Collar Crime Center (NWC3). Federal, state, and local law enforcement agencies receive online complaints, analyzing them to identify particular schemes and general crime trends in internet fraud, and compiling and referring potential internet fraud schemes to law enforcement. In addition to FBI and NWC3 personnel, the IFCC includes agents and analysts detailed from the Internal Revenue Service and Postal Inspection Service. In effect, the IFCC provides federal, state, and local law enforcement agencies with a single point of contact for identifying and referring internet fraud schemes for criminal enforcement.

Because criminal fraud schemes on the internet, such as major investment or credit card frauds, can be initiated and concluded in a matter of days or even hours, traditional methods of investigating fraud schemes no longer suffice. By co-locating agents and analysts from the FBI, the NWC3, and other agencies, the IFCC can provide a substantial investigative and analytical resource available on a nationwide basis to law enforcement and regulatory agencies.

#### AUCTION SITES

Increasing numbers of people are using internet auction sites like eBay. There are some specific preventive tips to make sure the site is legitimate. If the site does not have any contact information beyond an e-mail address, this may be a suspect site. Legitimate companies will have a physical address and a phone number rather than merely a post-office box. One should understand as much as possible about how the auction works. What obligations are as a buyer and what the seller's obligations are need to be understood before one bids.

Bidders should also find out what action(s) the website or company takes if a problem occurs. If there are no policies, then the site may not be reputable. When bidding on merchandise, one should learn as much about the seller as possible, especially if the only information provided is an e-mail address. Examine feedback about the seller. Potential buyers should not give out any information that is not necessary to complete the transaction.

GRAND VALLEY STATE UNIVERSITY

## Interstate Commerce Act

AFTER THE CIVIL WAR, the United States embarked on a massive railroad-building program. Although often subsidized generously by state and federal governments, railroad companies were private corporations, and regulation was nonexistent.

Each railroad had an initial natural monopoly but eventually they began to intrude onto each other's territory, creating fierce competition with associated special deals and costs that had to be made up in the areas without competition. Quickly, the railroads came to dominate the economic life of the communities they joined, especially those small agricultural towns in farm country previously accessible only by dirt road.

By the 1870s, farmers and others began to object to the excessive economic power of the railroads. Charges abounded of monopolistic practices, influence peddling in the political arena, stock manipulation, rate discrimination—and the reality was that the charges were at least somewhat true. Frustrated by inability to get their crops to market due to railroad manipulation of access to terminals and the availability of freight cars, the farmers organized and demanded government control of railroad abuses.

Their demands for government intervention fell on deaf ears. During the 1870s, the dominant philosophy in all economic matters was *laissez-faire* free enterprise, and governments at all levels were reluctant to interfere with the economy. The presidents and many Congressmen opposed regulation, and when the states attempted to regulate the railroad behemoths, the U.S. Supreme Court overturned their efforts. Worse, the efforts were futile because the state power ended at the state line. Illinois passed the first regulatory legislation in 1871, and southern and midwestern states quickly followed suit.

The railroaders faced a hodgepodge, with laws changing at each state line. Nobody found the situation to be satisfactory. Public demand finally got results years after the first complaints. The railroads generally supported one national regulation as preferable to the mix of state ones; it was more rational and easier to deal with (and manipulate). Railroaders were not happy with the cut-throat competition either.

Not until 1887 did Congress enact the Interstate Commerce Act. The act established the first true federal regulatory agency, the Interstate Commerce Commission (ICC.) The president, with Senatorial consent, appointed the members of this first “Fourth Branch” agency. To control abuse and discrimination by the railroads (and later trucking and other common carriers), the ICC required “reasonable and just,” and published shipping rates as well as no more secret rebates or price discrimination against small markets. The setting of equitable guidelines for railroad operations proved complex—what exactly did “reasonable and just” mean? What exactly constituted a “discriminatory” rate? The theory foundered in the details, and in the lack of clear and unambiguous support by the various administrations, as well as the pressures from the railroads and their political friends.

Further, although the ICC could call witnesses and investigate, it lacked enforcement power and adequate funding. It could advise the railroads that their rates were excessive, but it could not force alteration of those rates or levy fines or other punishments. The ICC's major accomplishments were the establishment of annual reporting requirements by the railroads and a prohibition of railroads setting special rates among themselves, or collusion in rate fixing.

And after the flurry of reform, presidents tended to appoint commissioners sympathetic to the railroads, further weakening the reform. Supreme Court rulings generally weakened the already tenuous commission, necessitating additional legislation over time.

Later legislation enhanced the ICC. The Hepburn Act of 1906 gave the ICC the authority to change “unjust and unreasonable” rates after a formal hearing. The Mann-Elkins Act of 1910 gave the railroads the burden of proving that rates were reasonable. The two acts in combination gave the ICC almost total control over freight rates and, thus, competition.

Over the subsequent decades, the government continued legislating restrictions on the powers of the railroads, imposing an eight-hour day in 1916, even taking over the railroads as a wartime exigency in 1918 before returning them under the Esch-Cummins Transportation Act of 1920. In the pro-business 1920s, the ICC regulated mergers, often forcing the combination of a profitable with an unprofitable route. Railroads, at the time and after, were coming under increasing pressure from cars, buses, and trucks on the growing network of federally subsidized roads. The ICC expanded its scope in 1940 to encompass the other carriers, but regulation of railroads remained primary until, in the 1950s, the ICC realized that the railroads were suffering, and no longer proved a monopoly threat at all. By the 1970s and 1980s, railroads had the freedom they had lost in the 1880s. But they had freedom in the teeth of fierce competition from trucks, airplanes, and other carriers. When deregulation was finished with the 1980 Staggers Act, railroads were close to moribund. By 1995, the ICC was obsolete. Deregulation eliminated its rate-setting authority: the ICC Sunset Act eliminated it in 1995.

The takeover of the ICC by the railroads is an example of the way in which regulatory agencies, intended to protect consumers, become captive of those they were chartered to regulate. After trucking supplanted railroads as the primary common carrier, the commission did come under attack for its favoritism, especially allowing artificially high prices and regulation to protect companies from competition by new entrants. By 1995, deregulation had reduced the power of the ICC, giving way to the Surface Transportation Board within the Department of Transportation.

## investigation techniques

HOW ARE WHITE-COLLAR and corporate crimes discovered? Compared to more traditional, or "street" crimes, the investigation of crimes in the business world is often more difficult and time consuming. This is due, at least in part, to the fact that white-collar and corporate crimes tend to be more complex, may involve multiple offenders and organizations, and may span many years duration before an investigation is performed. A primary difference between white-collar crimes and street crimes is that the latter may be committed with weapons of violence, such as firearms and knives, while the former can be committed with weapons that are not so obvious on the surface, such as through the use of computers, mail, and phone lines. All of these factors make the investigation of white-collar and corporate crimes a challenging endeavor.

Existing research and information on the investigation of white-collar and corporate crimes has generally focused on the broad category of fraud. Fraud may take several forms, and could be classified as either white-collar or corporate crime. Regardless of how fraud is categorized, criminologists and investigators agree that this all-purpose crime occurs most often in organizational settings. As a result, available guidelines and strategies for investigation of white-collar and corporate crimes are most applicable to organizations. Organizations can be victimized by fraud from within, or may also be the targets of scams from outside individuals, such as vendors.

First and foremost, a fraud investigation should have the approval of an organization's management. Much like investigations of street crimes, the goal of white-collar crime investigations is to reveal the truth. Before initiating a fraud investigation, there must be circumstances that suggest fraud has taken place, is taking place, or will take place. This standard is referred to as a "predication of fraud." Such a standard is important for a number of reasons. For example, since conducting an investigation can often be costly, investigators must be reasonably confident that evidence will lead to a guilty individual or individuals. Additionally, because a wrongfully accused individual can have his or reputation tarnished with a charge of fraud, investigators must also be confident that they can accurately identify the correct perpetrator or perpetrators.

Within organizations, investigation of fraud and other white-collar crimes may be performed internally or with the assistance of outside investigators. Exactly who performs the investigation will depend on a number of factors, such as the size and structure of an organization, and whether law enforcement actions are also required. While a variety of methods may be employed during the course of an investigation, one of the most common is the use of interviews. Regardless of who actually performs the investigation of white-collar crime, the methods used can be classified based on the type of evidence obtained.

Four general categories of evidence have been identified. The first of these, testimonial evidence, is collected from individuals that may be directly or indirectly involved in the offense. To obtain testimonial evidence, investigators can use techniques such as interviews, interrogation, and lie detector tests. A second form of evidence collected during the investigation of white-collar crime is documentary evidence. This type of evidence is taken from written and paper sources, but could also include electronic sources such as computers. The goal of obtaining documentary evidence is to link the perpetrator to the offense. To collect documentary evidence, investigators may locate public records, perform audits, analyze financial statements, or conduct computer and other electronic file searches. Physical evidence, the third general category, commonly involves detailed analyses performed by forensic scientists. Much like the collection of physical evidence in street crimes, this type of evidence can include fingerprints, stolen property, or other factors that physically tie an individual or individuals to the offense. Finally, the fourth category of evidence, personal observation, consists of the gathering of information by the investigators. This general category can include such investigative methods as surveillance and other undercover operations. In addition to classifying a white-collar or corporate crime investigation according to the types of evidence sought, an alternative classification approach is to focus on one of the three known elements of fraud: theft, concealment, or conversion. All three elements of fraud can be investigated with strategies known as inquiry methods. The investigator often proceeds by making a determination of which type of evidence will provide the strongest case against the perpetrator. To investigate theft, the general approach used is simply an attempt to catch

the perpetrator in the commission of the act. To investigate concealment, the focus of the investigator can include a variety of sources used to hide white-collar crime. To investigate the third element of fraud, conversion, investigators have the more difficult task of uncovering the ways in which a perpetrator may have spent or otherwise altered illegally obtained funds or information.

## investment trust fraud

AN INVESTMENT trust is a company that makes money for its clients by investing their funds in other companies. Normally, the investor will select an investment trust on the basis of the company's specialization, with trust companies often specializing in communication companies, energy producers, or electronic commerce companies. The investment trust manager pools the money provided by various investors and then places the money into one fund. This allows customers the opportunity to invest in a wider range of companies than if they were investing on their own. Risk is also believed to be spread out because the pooled money is divided over several companies.

A final benefit of an investment trust is that investors can begin by investing small amounts, with low charges by the company for investment decisions. This allows individuals who cannot invest thousands of dollars at a time to slowly accrue an investment portfolio.

There is also a trust known as a split capital trust. Under the normal investment trust fund, investors have the opportunity to benefit from the capital growth of the companies invested in, as well as benefit from the dividends paid by the companies. When dealing with split capital trusts, the in-

vestor has the opportunity to choose either income growth or capital growth; a process that leads to two separate classes of investors. Income investors are those who desire to receive dividends throughout the investment process, as well as recover the invested capital at the termination of the trust. Growth investors, forsake the dividends throughout the trust's life, but in exchange expect a percentage of the fund's capital growth at the termination of the trust. In essence, this means that an individual may choose to either receive a yearly dividend from the companies invested in, or they may choose to forsake the yearly dividend in exchange for a percentage of the pooled fund's growth during the life of the trust. The investor then has the option of a safe investment, which will pay out each year in dividends; or they may take part in a risky investment, which pays out profit at the end of the trust. The growth option is considered the riskier choice because if the fund does not grow, then there is no profit to pay out.

The very nature of the investment trust company allows for great potential of misuse or fraud. Because the investments are made in other companies, there is the risk that investments will be based upon personal preference of the fund administrator and not on the basis of potential for growth. Investment trusts companies are run by a board, but the individual investment decisions are left to the discretion of a general manager selected by the board. There are numerous stories of investment trust funds being invested into companies that were riskier than the investment trust would normally have considered, but the manager maintained a personal interest in the growth of the company.

Another scandal involved investment fund managers investing in each other's fund as a means of making the fund appear to be doing better than was actually the case. These activities eventually led to a state where losses were hard to determine, as investment trust companies had to first determine which fund had actually invested in an industry, and which funds were merely invested in other investment trust funds.

Many others have lost money on investment trusts because of bad investments and declines in the stock market. For example, during the height of the technology investing era in the late 1990s, many investment trust companies began investing in computer companies, software companies, and internet start-up ventures. These companies were consid-

ered guaranteed money-making endeavors. However, during 2000, the stock market dropped drastically as the internet industry began to disintegrate. The investment trusts were unable to pay the dividends contracted to customers, as the investment pools of many trusts were entirely devoted to technology companies.

One final fraud involving investment trusts is known as gearing. Gearing refers to the process of borrowing money from one fund to invest in additional shares of another fund. The process of gearing is risky because the investment fund manager runs the risk that the fund for which the borrowed money was invested in may not provide enough profit to repay the borrowed amount. Administrators of investment trust fund companies have admitted in recent years that the problem of gearing is serious enough to warrant extensive regulation by investment trust companies. Following the downturn in the economy in 2001, the stock market crashed and numerous funds that were already in trouble because of over-gearing were discovered all over the world.

Investment fund companies are not new, and they certainly provide a benefit to those who are interested in investing but desire to invest small amounts of money in the beginning. The solution is to ensure that the investment trust company is properly formed and regulates the administration of their funds.

## Investors Overseas Services

INVESTORS OVERSEAS Services (IOS) was the brainchild of Bernie Cornfield, a former social worker turned mutual-fund financier. Cornfield

took advantage of a growing mutual fund trend that began in the 1950s and continued well into the 1960s. Investment in mutual funds was booming, but Cornfield realized that commission fees were way too high, around 8 percent, and that mutual fund companies expenses were far too much. Determined to find a way around these costs, Cornfield incorporated his IOS business outside the United States and located it in Geneva, Switzerland, while he incorporated his new company's funds in Canada.

Marketing primarily to expatriate U.S. citizens, U.S. servicemen, and foreign nationals (mostly German), Cornfield quickly built up a staff rumored to consist of over 25,000 employees. Offering close door-to-door service different from other mutual funds, Cornfield's IOS was able to accumulate over \$2.5 billion in around 10 years. Growth continued and soon Cornfield began to let his tremendous investment profile get to his head. He began to live ostentatiously and, in one particular instance, he was front cover material for a popular German magazine, dressed in a velvet coat with a cheetah at his feet.

Cornfield's extravagant successes did not last long. By the end of the 1960s, stock markets across the world began to tumble. The IOS' famous Fund of Funds, which was a mutual fund that invested in other mutual funds offered by the IOS, began to suffer as a result of the worldwide financial difficulty. Soon, Cornfield and IOS faced some major trouble. Investors were pulling their money out of the IOS funds at drastic levels, and employees who participated in the stock-option plan withdrew their funds. In order to stay afloat, IOS had to hold a public stock offering.

IOS' offering was one of the largest ever for a European stock market. On the first day, the price of IOS shares jumped drastically, but by the spring of 1970, they had fallen from \$18 to \$12. Then, Cornfield attempted to bolster the price of shares, which he thought was a bargain, by forming a pool and convincing directors of IOS to invest heavily. Personally, he purchased of \$300,000 worth of shares in one particular instance. However, the price continued to fall and slid all the way to \$2.

During a search for help, Cornfield was approached by Robert Vesco, a businessman from New Jersey, who owned a conglomerate called International Controls Corporation (ICC). Vesco promised to cover IOS' losses and got to know other IOS

directors. Cornfield was unable to refuse his offer of assistance.

It was until much later that Cornfield and his fellow IOS directors realized that Vesco was taking money from IOS to cover his expenses at ICC. Upon discovery, which was after he had taken up to \$500 million, Vesco fled with his fortune and lived throughout the years in different Caribbean nations. With the U.S. Securities and Exchange Commission hot on his trail, he attempted to bribe President Richard Nixon for a pardon with a \$200,000 contribution to his campaign, but the scheme was exposed and consequently failed. Allegedly, he became a major force in drug-trafficking in the Caribbean.

Finally, after many years in Cuba, Vesco began to annoy Cuban leader Fidel Castro. He was charged with economic crimes against the government for illegal drug production in August 1976 and he was sentenced to 13 years in jail. His former cohort, Cornfield, was put in jail in Switzerland for 11 months on fraud charges. Cornfield then returned to the United States and lived in Beverly Hills, California, where he died in 1995 (after continuing to live his showy lifestyle during which he dated notorious Hollywood madam Heidi Fleiss).

## Iran-Contra Scandal

ON OCTOBER 5, 1986, a U.S. cargo plane was shot down over Nicaragua. Surviving crew member, Eugene Hasenfus, was captured by the Sandinistas, the pro-socialist government forces. Hasenfus's capture began the cover-up that would culminate in one of the most important scandals in American history. The Central Intelligence Agency (CIA),

working with Colonel Oliver North of the National Security Council (NSC), had setup a network of arms dealers, former military officers, foreign businessmen, retired CIA and Defense Department personnel, mercenaries, terrorists, and foreign saboteurs to sell missiles to Iran. These sales were designed to win release of U.S. hostages being held in Lebanon and divert the profits of the arms sales to Nicaraguan Contras, the anti-government forces supported by the Ronald Reagan administration. The Reagan administration diverted these funds because Congress had cut off all aid to the Contras by passing the Boland Amendment in 1982. The amendment was passed following the CIA's mining of Nicaraguan harbors.

The Boland Amendment made it illegal for the CIA to aid the Contras and, in 1984, Boland Amendment II forbade all sectors of the U.S. government from aiding the Contras. By then, the Contras' campaign was run by North, the NSC deputy-director for political-military affairs. North quickly established a top-secret military supply system. Moreover, knowledge, and in some cases direct approval, of the Contra-aid program came from Reagan's White House.

Unfortunately, North was no match for the Iranian negotiators, who were allegedly helping with the release of the American hostages in Lebanon. Each time an American hostage was released, another was captured. Meanwhile, the plan was working: the artificially inflated the prices of the arms sold to the Iranians allowed some of the profits to be diverted to the Contras. The arms sales took place between August 20, 1985 and October 28, 1988, and involved a total of more than 2,000 missiles and spare parts. Of the \$16.1 million in profits, \$3.8 million reached the Contras.

When Hasenfus informed his captors the he was part of a CIA operation, and identified two additional operatives by their codenames, the entire Iran-Contra affair slowly became public knowledge. North and other NSC officials began shredding incriminating documents and falsifying others, attempting to cover-up the scandal. Reagan and Attorney General Edwin Meese went on national television, on November 25, 1986, to reveal the "discovery" of the inter-related Iran-Contra efforts, and to lay as much of the blame on North as possible. An hour later, North was fired and his boss, NSC adviser Admiral John Poindexter resigned. In order to obtain the testimony of North and

Poindexter and others involved, Congress granted them immunity, undermining the ability of independent counsel Lawrence Walsh to prosecute them.

From May 5, 1987 until August 6, 1987, a joint congressional committee heard over 250 hours of testimony from 32 witnesses. No testimony ever linked Reagan directly to the scandal. North's secretary, Fawn Hall, testified to shredding classified documents and smuggling others out of the NSC building. Other Reagan personnel provided details of an endless number of lower-level bureaucrats and shady arms dealers involved in the scandal.

CIA Director William Casey died the day after the hearings began from a brain tumor. North admitted lying to Congress, destroying evidence, operating U.S. initiatives in violation of U.S. law, and participating in a cover-up; he cloaked his defense in patriotism and Reagan's praise of him as a national hero.

North's acceptance of a \$13,800 fence security system as a gift from businessmen who were profiting on the arms sales, was justified as necessary to protect his family from terrorists. The committee ended the hearings after Poindexter's August testimony, and issued a final report on November 17, 1987. The report conferred "ultimate responsibility" on the Reagan White House but stated a "cabal of zealots" therein had "undermined the powers of Congress as a co-equal branch and subverted the Constitution." Eventually 11 defendants were convicted of crimes. Former CIA operative Thomas Clines was the only defendant to receive a prison sentence—for falsifying tax records.

In Walsh's Iran-Contra report, published January 18, 1994, he concluded that both Reagan and Vice-President George H. W. Bush knew about the scandal and participated "or at least acquiesced" in the cover-up, but could find no evidence that either broke the law. The Associated Press noted on March 13, 2002 that many former Iran-Contra figures were given jobs in the George W. Bush administration. North could be last seen in 2004 as a commentator and host on cable news networks.

## Ireland

WHITE-COLLAR and corporate crime became enough of a public issue in Ireland in the late 1990s that the Criminal Justice (Theft and Fraud Offenses) Act of 2001 was enacted by the Irish government. The act covers: Money laundering the proceeds of crime; corruption against the European Union; corporate crime liability; computer offenses. It also includes the following areas where the law has been entirely replaced: larceny, forgery, counterfeiting, fraud.

As part of the act, a new era of corporate governance was declared with the establishment of the Office of the Director of Corporate Enforcement (ODCE), headed by Paul Appleby. He reported that the number of auditors' reports of suspected company law offenses more than trebled in 2003 to 1,500, from 399 the previous year. At the same time, the number of complaints from the public and other sources doubled to 448.

As a corporate enforcer, Appleby received close to 2,000 reports of suspected company law crime in 2003. The allegations included failure to keep proper books of account, directors' loans that exceeded limits laid down in company law, and failure to provide information to the Companies' Registration Office (CRO). During the year, the director successfully prosecuted 45 people, who were connected with 17 cases, in the District Court. The review said that 30 of these convictions related to 13 cases of failure to keep proper books of account. Of the remaining four, the court also banned one individual from acting as a company director.

### ORGANIZED AND CORPORATE CRIME

After centuries of poverty, underdevelopment, and emigration, Ireland experienced tremendous economic growth in the 1990s, reaping the benefits of European Union (EU) membership and large foreign investments. By the 1990s, however, Ireland's

underworld had blossomed into a lucrative, internationalized and very violent marketplace. As with many other countries, the links between white-collar, corporate, and organized crime became inexorably entwined.

More opportunities emerged with the end of the Troubles (conflict seeking the fate of Northern Ireland as a British territory). Until then, Ireland's small underworld had been dominated by a select number of crime bosses and their gangs (usually their immediate and extended families), that primarily dealt in small-scale fraud, gambling, prostitution, drug-smuggling, bootlegging, armed robberies; and relatively petty bribery paid to government officials.

After a serious rise in gang and drug activity, unexpected public and official outcries led the gang leadership to flee abroad, while its drug empire was taken apart by rivals, upstart gangs, and corrupt law enforcement. Ireland endowed itself with one of the most effective anti-organized crime set of agencies in Western Europe such as the Criminal Assets Bureau (CAB). In conjunction with international law enforcement agencies, Ireland began to restore its image, which had been tarnished by its reputation as an important cog in international money-laundering.

So effective was law enforcement that a vacuum was left to be filled by a number of international crime syndicates. Many took advantage of this window of opportunity. For example, Nigerian groups in the early 2000s were active in Dublin, the capital, where they introduced crack cocaine. Along with Romanian groups, Nigerians have become important players in a number of fraud (credit card and welfare) and counterfeit schemes (official documents). Irish passports are popular with underworld figures, and readily available as they are often bartered for drugs.

Taking advantage of a crackdown on Dublin's sex industry in 1999, Eastern European gangs got involved in the city's prostitution industry. Using a method pioneered by Chinese people-smugglers, women were brought in on student visas. Once in the country, the women and illegal migrants (from China, Africa, Eastern Europe and Asia) simply disappear. Chinese gangs are also involved in heroin smuggling, and primarily use Irish mules (human carriers) to transport it from British airports.

In spite of this internationalization, organized crime remains dominated by native-born Irish who

invest their massive profits in real estate and businesses in the island country and abroad.

Although part of the United Kingdom, Ulster and Northern Ireland's underground economy are now intrinsically tied to that of the Irish Republic. Loyalist gangs, whose political ideology makes any dealings with the Republic anathema, are known to launder their money in that country's banks, betting shops, and foreign exchange offices.

Northern gangs have also discovered the massive profits to be made in the smuggling of cigarettes and tobacco products, petrol (gas), and counterfeit goods such as pirated CDs and videos, clothes, and alcohol. Although the production, distribution and sale of counterfeit goods is largely in the hands of Northern Irish organized crime groups and paramilitaries, who control the markets where these goods are sold, they have struck-up working relationships with the province's South Asian community that produces much of the counterfeit clothing, as well as with international crime syndicates from Russia, China, and Italy.

## Irving, Clifford (1930–)

**AUTHOR CLIFFORD** Irving perpetrated a literary hoax by pretending that he was helping Howard Hughes (1905-76) write an authorized biography.

The sizeable public interest in Hughes, billionaire adventurer, aviation pioneer and movie mogul, an entrepreneur with deep involvement at the highest political levels of government, was due to his seclusion and eccentric habits. Hughes had not been seen in public nor made any public statement for many years. Irving firmly believed that the reclusive Hughes would not come out of seclusion to refute the fabrication.

Irving approached his publisher, McGraw-Hill, in 1971 with the story that he had a manuscript based on letters and interviews with Hughes, whom he claimed authorized the biography. This literary coup would have resulted in a major bestseller for McGraw-Hill because millions of people wanted to know what had become of Hughes, and why he had withdrawn from public life. Once the documents were signed, with Irving supplying a forged Hughes signature, McGraw-Hill offered him a \$765,000 advance. *Life* magazine, a glossy popular mass-market weekly, also agreed to run the story offering a \$250,000 advance. The Dell Publishing Company offered a \$400,000 advance for paperback rights. Checks payable to Hughes were illegally cashed by Irving's wife Edith.

Irving was inundated with requests for interviews. He played the game with gusto, thoroughly enjoying the celebrity status it brought him. Irving and his researcher and collaborator, Richard Suskind, benefited from a manuscript written by Noah Dietrich, Hughes's right-hand man and accountant, and used it as a basis for their deception, delivering the manuscript in 1971.

However, the ruse came to an end when Hughes made a totally unexpected telephone conference call on January 7, 1972, denouncing Irving's claim. Although Hughes had not been heard from in years, experts verified his voice. Hughes stated he had never met with Irving. The signature and letters that Irving claimed were written by Hughes were declared to be fakes.

Irving finally admitted to the hoax in 1972. He had to return the \$765,000 advance to McGraw-Hill. He was charged with 14 criminal counts: possession of forged documents; intent to defraud; grand larceny for stealing monies from McGraw-Hill; perjury; and conspiracy. His wife Edith and Suskind were convicted for their roles in the scheme. Irving was convicted of fraud and sentenced to two-and-a-half years but served only 17 months.

After his release from prison, Irving wrote many successful books. In 1981, he wrote *The Hoax* that was published in Great Britain. The fascination with the story was emphasized with the offer of a \$500,000 publisher's advance. This was later withdrawn. *The Hoax* explains in great detail how the plot to write the Hughes biography mushroomed beyond Irving's control. The story escalates into a spy thriller involving the international jet set, intrigue at an enormous scale, and the machination of corporate executives. As of early 2004, Irving lived in Mexico and continued to write nonfiction books.

## Israel

AS WITH OTHER COUNTRIES, it was not until Israel made the shift from a largely agrarian-pioneer society to an urban-industrial and bureaucratic one that corporate crime and its cousin, organized crime, became an important fact of life. Until then, phenomena such as patronage, personalized and informal business and political relationships were not seen as corrupt; they were the way things were done. Moreover, because Israeli authorities have been preoccupied with national security (since the state's founding in 1948) the issues of official corruption and organized crime were rarely studied or addressed until recently. They were not first-order concerns unless they had a direct impact on national security.

Organized crime came to the fore in the 1970s with the arrival of Jews from the Soviet Republic of Georgia, part of the Soviet Union. Some Georgians brought with them the ways and ethos of the Soviet Union whose economic and political systems

would have ground to a halt without the lubricants of graft. Thus, the Georgians had learned how to take advantage of the state, its property and the avarice of its officials. It was only natural that they would act similarly in Israel.

Part of this new ethos was embodied in the distinct codes and norms of the *vory v zakone* (Thieves Professing the Code). These progeny of 19th-century thieves' guilds thrived and dominated the gulags of the early Soviet period until the end of World War II. Unlike other prisoners, the *vory* consistently refused to work and were steadfast in their unwillingness to cooperate with authorities; a *vor's* reputation was largely based on his ability to withstand the state's harassments and punishments. Although most *vory* were killed, their ways were resurrected in the 1970s and 1980s by a new generation of criminals, a significant number of which were from the Caucasus in Georgia.

In Israel, the Georgians introduced new types of criminal activities, such as currency and official document counterfeiting, corruption of public officials and large-scale frauds, and illegal diamond trafficking. They also improved existing activities such as consumer-goods smuggling (Israel has very high taxes), extortion, and theft. The latter was facilitated by the criminals' presence in many of the country's sea and air ports.

The Georgians didn't survive past the midway point of the 1980s, as many of their leaders either died (naturally or prematurely), fled the country, or were imprisoned. There were to be no second-generation Georgians. Moreover, like their brothers in the Soviet Union, these traditionalists were marginalized by a more violent and entrepreneurial younger generation of native-born Israeli and second-wave Soviet immigration gangs.

The second wave of Soviet Jewish immigration started in the 1980s, when many were escaping from the anti-Semitism and poverty of a crumbling Soviet Empire. As is the case in most migrations, this one brought with it a certain criminal element. The element resembled its predecessors only in terms of its creativity and lack of respect for law enforcement. However, these groups fundamentally differed in use of violence, the newer wave being much more prone to use violent methods to collect debts, extort protection fees, and settle disputes.

At first, the new immigrants clashed with Israeli gangs (primarily made up of Jews from the Middle East). But, the potential profits from drugs and

arms trafficking, prostitution, money laundering, auto theft, and diamonds proved alluring and partnerships were hammered-out. Clashes still occur, especially between Russian and Israeli street gangs, but violence is not good for business as it attracts undo attention from the authorities and the media.

Because the drug trade is a global one, Israeli organized-crime groups have had to develop international links with groups from Turkey, Lebanon, Thailand, Africa, and Latin America, not to mention those from the former Eastern Bloc. From these countries come cocaine, heroin, hashish, marijuana, designer drugs such as Ecstasy, and methamphetamine. Interestingly, cocaine from Latin America comes into the Tel Aviv airport from where it is transported to Beirut, Lebanon.

Israel also has the dual problem of people-trafficking and smuggling. Although they are often used interchangeably, smuggling and trafficking are two different phenomena. Smuggling essentially refers to the illegal transport of a person or persons across an international border, while trafficking entails the use of coercion, deception trickery, and exploitation in the people's recruitment, transport, and harboring.

Most of those trafficked end up as indentured labor working in prostitution or sweat shops. The entire trade in human beings has been facilitated by a number of corrupt officials who have sold visas to the traffickers and smugglers. Corruption of Israeli bureaucracy has become a major concern as evidenced by allegations that Russian mafia leaders, for instance, have generously donated to political parties and campaigns.

Although a lucrative market, Israel remains a very small one. It does, however, constitute a safe haven for certain people as Israel offers a relatively facile investment environment, one which facilitates money-laundering and will not deport its citizens. The Law of Return, whereby any Jewish person can claim Israeli citizenship upon arrival in the country has therefore created a lucrative market in false papers indicating a Jewish background.

## Italy

A DISREGARD for the law is one of the challenges facing Italy today. Evidence suggests that a weak civic sense is one of the causes of this phenomenon. Often, and in many differing contexts and situations, Italians seem to place their own immediate advantage above the common interest. The state is viewed as an antagonist, or even as an enemy, rather than the expression of the common good. This attitude is presumably based in part upon the conviction that the state itself is far from being a law-abiding counterpart. The fact that what belongs to the public sphere is looked upon with skepticism, if not with open contempt, can be attributed to a number of factors.

One is the existence of an incompetent or corrupted central administration (metaphorically expressed by the relatively widespread practice of calling Rome, the capital city where the Italian bureaucratic apparatus reigns, a "whore"). A second factor is the deeply rooted patronage system (the exchange of favors between politicians and the electorate), and a third is the interpenetration between elements of the state apparatus and the world of organized crime. The lack of a strong civic sense and the consequent distance between the individual and the state, are particularly evident in the southernmost areas, traditionally a territory largely neglected by the state. Here, the rhetoric may reach its extreme formulation: nothing and nobody exist outside one's (extended) family.

Another concept, that may help to explain the existence of many areas where the border between legal and illegal activities is blurred, is the perception that the law in Italy has, more often than not, a value which is merely symbolic. In contrast to the

common-law practice typical of the Anglo-Saxon countries, in Italy laws never lose their status as symbolic simply because they are not enforced. Therefore, it may not be entirely surprising that even law-abiding citizens may look skeptically upon legal rules or may treat them as an object for negotiation and compromise rather than as principles to be respected. This anti-state attitude has certainly not been weakened by the fact that the prime minister in the early 2000s, Silvio Berlusconi, was very much involved in finding all possible strategies (including the passing of personalized laws) to avoid the risk of being convicted of breaking a number of his country's laws. This deeply ingrained Italian cultural attitude must be borne in mind when seeking to describe Italian business organizations, organized crime, and the ties between them.

#### ITALIAN WHITE-COLLAR CRIME

Business crime, a term which is considered equivalent to other terms such as economic or white-collar crime, means, in our definition, to deal with violations committed by persons of high social status in the course of pursuing their profession or occupation. From this definition, it follows almost automatically that business crime is, typically, a hidden crime. Business crime is characterized by the presence of a number of factors. First, the technical nature of the crime may impede detection and subsequent prosecution. Second, the relatively high social status of the offender helps him to be "invisible" in the eyes of the judiciary. Many Italians, perhaps even the judges themselves, who see in the offender a member of their own social class, do not see such an offender as a real criminal.

Finally, since such defendants, unlike the perpetrators of street crimes, have access to a private attorney, rather than having to rely upon a public defender, they are far more likely to be acquitted. As a recent investigation based upon a two-year study of criminal trials has shown, the probability of a white-collar criminal gaining acquittal is three times higher than that for a blue-collar defendant. This specificity is not uniquely Italian since it springs out of the more general power relations within society.

In short, statistics about convictions of white-collar criminals are nothing but the tip of an iceberg. Yet, this inability to quantify the extent of white-collar criminality on the basis of convictions

recorded does not prevent a credible picture of business crime and its diffusion within and impact upon Italian society. There is enough empirical evidence from other countries, particularly from large surveys carried out in the United States, showing that corporations, including the most respectable ones, do violate the law. Clearly, there is no reason to think that Italy should represent an exception.

We can gain insight into the behavior of leading managers by looking at the cases of insider trading, one of the few white-collar crimes where quantitative, albeit scarce, data are available. According to CONSOB, the authority controlling the Italian stock market, there is a clear upward trend. In the year 2000, 38 dossiers (inquiries) were sent to the prosecutor's office, twice as many as the previous year. However, not surprisingly, only two persons have been convicted since 1992, the year when this behavior became criminalized.

We may also turn to a case which shows how business crime easily finds its nourishment in association with other partners, such as the public sector and organized crime. In fact, corruption itself can be considered a special type of white-collar crime. A typical case is the criminal association among entrepreneurs, professional criminals, and public servants. In this instance, organized crime is the armed enforcer which guarantees the realization of lucrative illegal economic transactions carried out by entrepreneurs with the complicity of public administrators.

This kind of criminal association, where several criminal typologies are involved, has played a central role in the greatest scandal since World War II, a scandal that unfolded in Italy in the early 1990s. This criminal conspiracy or system was referred to as "Tangentopoli," first in the national and local media, and then in public discourse, a term taking its name from the word *tangente*, indicating the money extorted from or paid by the entrepreneurs to managers, bureaucrats, and political leaders. This scandal involved major corporations as well as members of the parliament, of the public administration, and of the judiciary.

Bettino Craxi, former prime minister, and leader of the Socialist Party (a professional criminal, he was sentenced to many years of imprisonment on charges of fraud and bribery) theorized that bribes were a necessary fuel for the smooth and efficient functioning of society. Socialists were some times called "10-percent men," since it was

they who introduced the principle of taking 10 percent out of every illegal economic transaction.

What the prosecutors discovered was an entire universe of criminal activities, from bribery to extortion, from fraud to murder—probably the largest known number of crimes committed by Italian political and economic elites. A few facts: according to the prosecutor's office in Milan (investigations and trials were carried not only in Milan, but in several other cities and thousands of similar cases were discovered) the economic value of the crimes committed by the politicians alone involved amounts of over \$1 million; one member of parliament (MP) out of three was under investigation; one MP out of four was charged with serious offenses (crimes implying imprisonment). But the big money went abroad. Just one example: approximately \$100 million were held in two Hong Kong banks, the Hong Kong and the Shanghai Banks.

The 2000 figures from this single prosecutor's office furnish the following picture: 3,200 people investigated; 2,575 tried; 577 condemned; 2 people in prison. It should be noted that these figures are a good illustration of the more general case made above, namely, that the very nature of this type of crime reduces the probability of obtaining a reliable measure of its diffusion. The discrepancy between the number of people who were the object of investigation and the number of those who actually went to prison is simply enormous.

If white-collar criminals have always been difficult to detect, prosecute and convict, that is the case to an even greater extent today. Over the past two decades, the campaign of moral consciousness-raising, as well as the public support for aggressive prosecution of white-collar crime which followed the Tangentopoli case, have quickly ebbed. In a general climate of increasing attacks against the Milan judges, accused of not only going into politics but of persecuting the prime minister himself, laws have been recently passed that have made it practically impossible to prosecute him and, more generally, corporations and individual managers for publishing fraudulent balance sheets and other related economic crimes.
